

ROYAL GARDENS KEW.

1 ... 1.

THE

JOURNAL OF HORTICULTURE,

COTTAGE GARDENER,

AND

HOME FARMER.

A CHRONICLE OF COUNTRY PURSUITS AND COUNTRY LIFE, INCLUDING BEE-KEEPING.

CONDUCTED BY

ROBERT HOGG, LL.D., F.L.S.

Established

in 1848.

VOLUME XXVII. THIRD SERIES.

JULY - DECEMBER, 1893.

LONDON:

PUBLISHED FOR THE PROPRIETOR, 171, FLEET STREET.

LONDON:

PRINTED AT THE JOURNAL OF HORTICULTURE OFFICE,

171, FLEET STREET.

TO OUR READERS.

The years whirl round apace, and the more there are of them the quicker do the seasons appear to come in their turn. This will be the experience of all our old friends and helpers, and they will feel, as we do, that speeding time is made the more pleasant by the good influences of the gardens which they love to tend, and from which they derive health and inspiration. May their garden pleasures be much prolonged, not for themselves alone, but for others who benefit by their experiences as detailed by facile pens.

To the younger, but yet strong, as if in their zenith, the time will glide more steadily, and they we hope shall have a long, useful, and prosperous career before them. It will not be less so by their endeavours to incite in others the love of gardens they themselves enjoy, and by their efforts in imparting knowledge on subjects pertaining to the craft they adorn.

To the younger still—the probationers in that craft—time may seem to drag; to some their work may be hard, and they look longingly onward to what they hope may be an easier life. Their time will come, and it depends on themselves, and the assistance given them, whether they will fill the positions they will occupy as worthily as do men who fill them now, and as those who have gone before. We counsel young men to strive for knowledge and to win respect, and we trust those in authority over them will aid them in the commendable desire.

We rejoice in having the co-operation of men, amateurs and gardeners, of ripe experience, as well as of young men of great promise, and therefore it is that we are enabled to make the pages of the *Journal of Horticulture* not only substantial, but bright—even sometimes lively—and it is gratifying to know that our readers are satisfied. A gardener writes:—

"Besides the practical knowledge that I have gained from the Journal, I have learned to love gardening for its own sake, and that makes arduous duties appear light. As a result I have been able to give the utmost satisfaction to my employers, and have good recommendations from them. . . . I have to seek a fresh field of labour, but I still hope to be able to show that the teaching of the Journal has not been thrown away on me. Long may Editors and staff continue to advise, instruct, commend, and not to forget wholesome reproof where needed. . . . I make no apology for troubling, as you have forgotten to despise the small gardener."

Despise the small gardener! We have just the same respect for able men, who are doing their duty creditably and well in small gardens, as for those in large ones. Some of the great gardeners of the day won their spurs in small gardens, and we are glad to know that not a few managers of these small gardens are as happy in their homes as are the gardeners of lords and dukes. We trust our appreciative pupil has found a comfortable home.

A correspondent, who is not a gardener, but a country gentleman in the Midlands, has written to us from Biarritz:—

"The Journal of Horticulture is one of the very few papers I have sent on here. I have had splendid crops at home—beaten my 'practical' neighbours in growing Swedes, Mangolds, Oats, and Parsnips—by following your rules. Your Farm Notes are splendid. If 'practical' farmers would follow them as the amateur does, I do not think we should hear much more of the impractical—viz, a duty on corn imported."

We have said our Readers are satisfied; so are we, and we thank all most cordially, amateurs and gardeners, old and young, for contributing so ably in making the *Journal of Horticulture* the welcome guest it undoubtedly is in the homes of the wealthy and the workers in this and other lands.

Our best wishes to all for a happy close of the old year and an equally happy opening of the new.

OME time ago, when our "Home Farm" contributor had been referring to rich pastures and full crops as the result of the soil being well stored with plant food, a correspondent desired to know where such verdancy could be found. Residing in a high, dry, and not over-well tilled locality, the incredulity of the querist was not unnatural. Not in his district alone, but over a vast tract of country, notably in the southern and parts of the midland counties, fields, banks, and roadside margins were so parched that scarcely a tinge of green was visible. Not a "bite" could be found in the grazing pastures, and meads afforded little or nothing to the mower. Garden crops were languishing, and the anxiety of gardeners becoming extreme in view of the actual collapse of some crops, and the prospective exhaustion of others weeks before their time. Just when a breakdown of supplies for man and beast was imminent the rain came and cheered the falling spirits of the husbandman, and in some, perhaps many, districts gave a distinct flush to vegetation. The parched earth was moistened, enabling sowing and planting to be done that had long perforce remained in abeyance.

But this was not so everywhere. Some localities were visited by drenching thunder showers during the last week in June, a few doing damage by their violence; in other districts the showers extending more or less fitfully over two or three days, were just sufficient for the resumption of cultivation and "saving" established crops, but in some tracts of country the rain was so light that only the leafage of plants and herbage in gardens and fields was freshened and the surface of the ground temporarily cooled. It was a respite from exhaustion, nothing more; and we are now informed on reliable authority that there are stretches of country along the south coast, in Sussex, Kent, and parts of Hants and Surrey, in which, to quote a graphically descriptive phrase, "roads and pastures are all one colour, a cheerless, whitey brown."

We know from a passing glance through the country by rail and road between the English Channel and the Humber that the above statement is true as regards the localities to which it refers; and we also know that, much as northern farmers and gardeners have felt, and perhaps still feel, the exhausting effect of the drought, they ought really to be happy in escaping the immeasurably greater stress and strain that land workers in the dry uplands in the midland counties and the parched tropical slopes in the south have had to endure. But while being convinced of the general accuracy of the above comparison, we have to record our conviction of a fact which we believe to be indisputable. Whether in the north or the south, or anywhere and everywhere, land that is naturally rich and deep by alluvial deposits, and not exhausted by greed or misjudgment, also land that has been subjected to deep culture and generous enrichment by workers with means and knowledge, "holds out" the best, and supports crops of all kinds for use or ornament long after the poor and thinner mediums "give out," and vegetation withers and dies. There is not a square mile in the kingdom where the land is amenable to profitable cultivation that the accuracy of the above dictum is not demonstrated. We find, comparatively speaking, gardens full and fields bare almost everywhere. What is the reason? It is a case of land fertility on the one hand, and land sterility on the other. We

find striking examples of this over much smaller areas than a mile. Even in the same field they are evident, and to test the matter still more closely over an acre of land in almost any field devoted to small allotments the truth of the proposition stares us in the face, and cannot be obscured.

Take a glance say at four roods of Barley side by side belonging to as many cultivators, the previous crop in each case Potatoes. We find on one piece full healthy clean growth capable of yielding at the rate of at least five quarters of grain per acre, and probably six. The next piece is weak, thin, stunted, weedy, and cannot approach half of such yield. The plot adjoining this is very little, if any, better; but the next "jumps up" more than a foot higher, a fleecy mass of waving plume-like heads. All the plots have had the same amount of sunshine and rain, yet the crops in some flourish and in others fail. Let not the owners of the failures condemn the land and the sun, but rather take a lesson from their successful neighbours on the remarkable potency of high cultivation during periods of drought. As it is to be feared the average man who works on the land is a stubborn animal—too stubborn to believe in and learn the lesson so eloquently taught by the Barley, he must have another course. He can enter a field of twenty rod plots of Potatoes, take any eight of these plots side by side, which cover one acre. One or perhaps two of these plots are supporting plants with stout stems and broad thick leaves that meet across the space of 27 inches between the rows, and would be better with more room. Of the remaining plots half may not be half so good as the best, and the others stunted and miserable, not capable of paying the rent of the land. Again we ask what is the cause of the difference? and again the answer is enriched soil and good management in the one case, impoverished ground or errors in culture in the other. If there is any other valid reason we shall be glad to know what it is. As in small cultures so in large. One field is full of grain or roots—a cheerful prospect; the next thin in crop, weedy, or bare—a depressing spectacle. All have had the same quantity of rain and the soil is of the same original staple. Deep clean generous culture and timely cropping always "tell," but never so clearly as in a long period of drought. Shallow, late slipshod working and exhausted soil tell also, but disastrously.

Our farm contributor is right all through the piece in his insistence on a more generous and intelligent treatment of the soil. In no other way can either farming or gardening be rendered profitable in dry seasons, or any seasons. The striking differences in crops are as apparent on land in Surrey and Kent as in Huntingdonshire, Notts, and Lincolnshire, where inspection has been made. Starved farm land is dried out; deep fertile garden ground supports altogether superior crops. Highly farmed and well fed land is productive, and the grass remains green for weeks longer than in thin poor soil, and all other crops differ in the same way. "No grass in the midlands" is a familiar line. It is too true over a great extent of country; but go to Southwell, where Mr. Merryweather grows Roses, and a green district will be seen. The grass is knee deep in some of the least used nursery paths, or was ten days ago. Perhaps it is cut now. The roadsides are the same, and the fields the reverse of brown. Because the land is rich the grass is rich, if it were poor so would be the herbage.

Go to Gateford and see the splendid crops of all kinds on the excellent squire's estate near Worksop—Mr. Machin's—the Rose squire of the Midlands. The Roses and the crops are what they are because both are well managed by owner and tenants. Would that all were like them—that all had such land and equally, as the late Lord Tennyson said, "did their duty by it." Farmers are not going to ruin there, nor in the best farmed lands of Lincoln; but even among the best, indifferent crops occur here and there to mar the fair face of the country. It is just a question of individual means, ability, energy, and management. It is the same all round and everywhere. Starve the land and it will starve both worker and owner; deepen it where needed, feed it, clean it, stir it to keep

in the moisture, and it will support both to an immeasurably greater extent than so much of it does now.

It is announced that the Board of Agriculture are instituting nquiries for ascertaining the best means to adopt with land in dry seasons. The best crops, and there are good and bad everywhere, tell clearly enough what is needed. More thorough working, more manure-plant-food-in the soil, with surface working to conserve the scant moisture, and no weeds to devour what the crops so urgently require and must have to render them satisfactory. Such are some of the clear, plain, practical lessons taught by the drought of the present year. Let not their significance be disregarded.

WHAT PAYS BEST?

(Concluded from page 516, last vol.)

CARNATIONS succeed admirably in the 14 feet wide houses, either on low roughly extemporised stages or on the borders with boards, slates, or tiles under the pots. The common "Malmaisons" do not fetch very high prices in Covent Garden now-a-days, but the rage for them has extended to provincial towns, where they sell readily enough at from 6s. to 12s. per dozen, according to quality and the time of year. The pink or more richly coloured forms not being so extensively grown, still sell well in London, or somewhat better than they do in most provincial towns, most that I have sent to Covent Garden averaging 12s. per dozen. Provincial people also like good scarlet Carnations of the Winter Cheer type; the superior whites, notably Mrs. Moore, likewise finding ready sales at from 1s. 6d. to 3s. per dozen blooms. For selling in pots, the new race known as Marguerites, and which flower the same year as raised from seed, are among the best that can be grown, plants in 6-inch pots with six or more blooms expanded on them selling freely late in the autumn at 1s. each. This season I have raised about 2000 of these Marguerite Carnations, all being planted out where they are to remain till September—early or late in the month, according to circumstances. Very few of them will ever see the inside of pots, as the bulk will be prepared for lifting by being cut round in August and later on transplanted to the border of a house in succession to Tomatoes. All being well we shall have some grand blooms from these, selling them in mixed colours and in bunches thirteen in each, at prices varying from 6d. to 1s. 3d. per bunch. All will be cleared out by February, or in time to plant early raised Fomatoes. Where the water supply is not good and labour somewhat short, the same plan may well be tried with other winter flowering Carnations, Malmaisons excepted. The popular colours are red, scarlet, yellow, white, and flesh pink, and the varieties should be also those that do not invariably burst their pods. The prices for all such vary from 3s. per dozen in times of scarcity to

1s. 6d. per dozen when more plentiful—wholesale in each instance.

Bouvardias are by no means overdone in the provinces, the double-flowering forms being worn by gentlemen, and the single whites, notably the Jasmine-flowered varieties, in bouquets, wreaths and crosses. These succeed we'l when planted out in a warm position and rather light soil, lifting and repotting or transplanting to a border, sharing a house, if need be, with Carnations, the latter being given the coolest end. Callas, or Arums as generally termed, are too often a drug in the market to be very profitable, and the only times a good sale for them is certain are at Christmas and Easter. Those who succeed in flowering them well at the first festival and can contrive to have some for the latter busy time among church decorators can afford to sell them cheaply in the interval. At no time are the prices so good as formerly. Last Christmas 9s. per dozen was considered a fair price, and all we had at Easter did not realise 6s. per dozen. They need never be grown in pots. The old plants being dried off directly the Easter flowers are cut, then pulled to pieces, planted out on good ground, lifted before the middle of September, and replanted in the houses, will

pay fairly well for the little trouble expended on them.

This brings me to yet another useful class of forcing houses, and which market growers cannot very well dispense with. roofing for houses 12 feet wide and 100 feet long can be bought cheaply, and being duly fixed to well buttressed 9 inch walls, or to boarded sides, in either case 30 inches above ground, and glazed with the best 21-oz. Belgian glass, a cheap structure is the result. In this instance there ought to be a flow and return pipe up each side, or the return may be brought back on each side of the central path, while it also pays well to have a bottom heat pipe 2 feet or so from the sides. Such structures fitted up with wooden latticed staging, or better still with light T iron framework covered with sheets of galvanised iron, ashes or clean shingle being placed on this, are admirably adapted for propagating purposes, and in

particular for raising thousands of sturdy Tomatoes, Cucumbers, and other plants. These warm houses are also the best for Cucumbers, and these properly managed are, considering the short time they are about, even more remunerative than Tomatoes. Melons, again, succeed well in them, but for these to pay well the fruit ought to be fairly large, prettily netted, of an attractive colour, and perfectly sound when they reach Covent Garden in May and June. Later fruit had better be sent to provincial towns, and high prices will not be had anywhere for them.

After the Cucumbers and Melons are cleared (two distinct crops of the former being grown in one season) fit up stages for pot plants. Maidenhair Fern should certainly be grown extensively, the fronds finding a ready sale locally and in large centres at 4d. to 6d. per dozen, neat plants also going off well at 9s. per dozen wholesale, and 1s. each retail. Cyclamens ought also to be prepared by the hundred for flowering in such stage-fitted houses, the flowers of these selling freely at 4d. per dozen, or rather less at times, the plants also finding a ready market at remunerative prices. Double Chinese Primulas are not in great demand in a cut state, but when well flowered in 5-inch pots they sell freely enough at 9s. per dozen. When a good stock of A. F. Barron can be propagated, this superior variety will find ready sales in a cut state. Pelargoniums, especially Raspails, are largely used by church decorators, particularly at Christmas and Whitsuntide, and pay well at an average of 6d. per dozen. If strong plants are pre-pared in the open, and wintered clear of each other on stages in moderately warm light houses, they will flower grandly as long as desired.

This does not exhaust my list of plants that can be profitably grown during the autumn and winter in houses primarily intended for fruit culture, no mention having been made of Lily of the Valley, Roman and miniature Hyacinths, Freesias, Narcissi, Spiræas, and such like, but I must be content to add that orders for all the latter should be placed at once, or the bulbs or roots may not be obtained at similarly low rates if ordered much later on .-MARKET GROWER.

VENTILATING ORCHIDS.

Odontoglossums are very impatient of direct sunlight; they should, therefore, be shaded from sun at all times, from early spring until all danger of burning is past in late autumn. Even in the winter during occasional short periods of bright sunshine the blinds are let down. The plants are never allowed to become dry, and are kept very moist during the summer. The house is ventilated day and night all the year round. The bottom ventilators, or those placed below the staging and about a foot above the floor, are left partly open on the coldest of nights, full ventilation from this point being given throughout the warm season. The top ventilators are opened not later than 6.30 A.M. more or less during warm weather, a little air being left on all the night in weather like the present. The side ventilators, or those on a level with the side staging of the house, are occasionally opened, but only to keep down the temperature when it gets beyond the control of the top and bottom ventilators. Side ventilation has a tendency to dry the house and plants unduly, and should only be employed when absolutely necessary; 70° Fahr. may be considered the maximum summer temperature for Odontoglossums, and 60° the average during the summer. In winter 50°-55° is a good general temperature 5° either way doing no home according to a standard t ture, 5° either way doing no harm according to external temperature.

Cattleyas require plenty of light, air, and moisture during the summer and early autumn, with all the sunshine available in the autumn, winter, and early spring. Heavy shading should never be used, only sufficient to keep the plants from scorching. Advantage ought to be taken of every period of dulness, however short, to remove the blinds. Permanent shading of canvas or wash should never be used. An average temperature of 5° higher than the Odontoglossums is necessary. They require air at all times, but not quite so much as the Odontoglossums. I grow Odontoglossum citrosmum, O. Harryanum, and O. grande with the Cattleyas. The house should be kept moist, likewise the plants, during the growing season, with a drier atmosphere and less water at the root after the pseudo-bulbs have finished growth. A stagnant atmosphere must be avoided at all times. Under the foregoing treatment the Odontoglossums and Cattleyas in my care grow and flower freely.

—W. R. W.

DISA KEWENSIS.

This is a new hybrid which has been raised at Kew from D. grandiflora and D. tripetaloides. It is decidedly pretty. The leaves, scape, and general look of the plant are like those of the hybrid D. Veitchi, the parents of which are D. grandiflora and D. racemosa, but the flowers of D. Kewensis are smaller, being 1½ inch across. The lateral sepals are 1 inch long, ovate, slightly recurved and coloured rich rose; the posterior sepal is hooded, as in D. grandiflora, three-fourths of an inch in diameter and coloured rosy lavender, with red spots; the lip is yellow inside, with transverse lines and spots of crimson. The scape is 18 inches high and bears six flowers. The seeds were sown in November, 1891, so that this plant is only eighteen months old. There are numerous other plants of the same age, but only one has flowered.—W. Watson (in "Garden and Forest.")

LÆLIA MAJALIS.

This is a dwarf, compact-growing species, and rather a shy bloomer, but when well flowered it is very showy. The flowers, borne singly on the spike, appear on the young growth in spring, and are about 5 inches across, the petals broader than the sepals, rose colour, lip large and streaked with purple. It should be grown in a sunny position in the Cattleya house, and when the growths are made the plants ought to be removed to the open air for a time. This species succeeds best on a block or in very shallow pans.

LÆLIA PURPURATA.

This magnificent Orchid is now flowering in most places, but it is not everywhere that fine specimens are seen. Small plants do not show the character of the species; but when seen in good condition, and specimens 2 to 3 feet through, it is one of our grandest Orchids. The habit is very robust, therefore the culture is comparatively easy, and as plenty of water is required at the root while growing an open compost is necessary. It should be kept with the Cattleyas, and in a genial temperature while growing.

AËRIDES.

This is a beautiful genus of epiphytal Orchids, most of the species of which are easily grown. The flowers are produced in cylindrical racemes from the axils of the leaves, mostly near the tops of the plants. They are usually fragrant, last a long while in perfection, and vary in colour from white to pink and rose. All the large growing species, of which A. odorata is a well known type, can best be grown in broad and shallow wood baskets. Small plants should be suspended, but larger ones may be grown on the stages if allowed plenty of room.

Aërides require a strong moist heat in summer with something for the long white roots to catch hold of as they grow, and there is nothing to equal sphagnum for this purpose. If this is renewed every spring together with a few lumps of charcoal or ballast, large plants may be kept in health for years without being disturbed at the roots, and the number of flowers they produce under these conditions is remarkable, the growth also being very free. In the winter they should be kept drier at the root, but not sufficiently so to cause shrivelling of the foliage or the lower leaves to fall off, as

this greatly disfigures the plants.

As a proof of the rapidity of growth under these conditions, it may be worth mentioning that I once grew a plant of A. odorata in three years from a small piece in an 8-inch pot to a specimen over 2 feet through, with five or six stems, the highest of which would be about 30 inches, and which the last season it was under my charge produced sixteen racemes of flowers, many of them 18 inches in length. The smaller growing species, such as A. affine and A. roseum, are rather more difficult to grow. They require more attention in the autumn to ripen the growth made, and should in all cases be suspended near the ventilators, a constant supply of fresh air being of the utmost importance.—H. R. R.

PHALÆNOPSIS SCHILLERIANA.

ENCLOSED is a photograph of ten plants of Phalænopsis Schilleriana, which were grown here this year, and bloomed in March; the most blooms on one plant were sixty-two, and the least twenty. If you think this note worthy of a place in your valuable paper you will oblige by inserting it.—WM. MCHUTCHEON, The Gardens, Auchindennan, Alexandria, Dumbartonshire.

[We are always ready to insert records of good cultivation such as the photograph represents; it is, however, not quite suitable for reproduction in our columns, and we suspect hardly does justice to the plants as they were when in full beauty.]

SALE OF NEW ORCHIDS.

As announced in our advertisement columns last week, Messrs. Protheroe & Morris will sell by auction at their rooms in

Cheapside, E.C., to-morrow (July 7th) a number of new Orchids which have been imported by Messrs. F. Sander & Co., St. Albans. These will include Eulophiella Elisabethæ, Habenaria gigantea var. sumatrana, Cypripedium Nicholsonianum, Dendrobium Phalænopsis var. Schröderianum, and a rosy red Oncidium from Venezuela.

CAMPANULA PERSICIFOLIA ALBA BACKHOUSIANA.

THE Peach-leaved Bellflower, Campanula persicifolia, is a very old garden plant. According to a writer in 1797 the species was then

FIG. 1.—CAMPANULA PERSICIFOLIA ALBA BACKHOUSIANA.

becoming uncommon in gardens, its place having been taken by the improved varieties which had made their appearance even at that early date. The number of varieties has been considerably increased since then, and perhaps the most popular as well as the most useful is the white form C. persicifolia alba. This has in turn been undergoing improvement, and the variety now under notice is a considerable advance on the older form, the pure white flowers being much larger and finer than in the typc. It is a first-rate variety for pot culture, as it continues a long time in flower, and is said to force well. Fig. 1 represents it.—A. B.

NOTES FROM SOUTH WALES.

THE present season will be remembered as one of the hottest and driest on record for many years past. The rainfall during March was only 0.35 inch, which fell on six days, and the fall in April was still less—0.25 inch, which fell on three days. The rainfall in May was 2.49 inches, but owing to the dry state of the ground and the prevailing hot bright weather it soon evaporated, and vegetation was little benefited by it. The fall in June was very low, 0.60 inch, with a high temperature and scorching sunshine. The ground has been dried now to a considerable depth, and vegetation is suffering severely for the want of rain.

All kinds of fruit trees flowered profusely this year from a fortnight to three weeks earlier than usual. The weather was favourable during the time they were in flower, and the fruits set well and swelled freely until the trees began to feel the effects of the drought, when the Apple trees began to get covered with red spider and American blight. The fruits dropped off in great numbers, and they have continued to drop more or less ever since, although many of them are more than half grown. The set of Apples and Pears was enormous, and the Pitmaston Duchess Pear trees here had to be propped up six weeks ago to keep the branches from being broken by the weight of fruit. Plums are a much better crop than I anticipated early in the season, but the trees are very much blighted with aphis. If we are favoured with copious rain, of which there is no sign at present, there would be a good crop left; but the fruits will be smaller than usual.

The crops of small fruits have been very good, notwithstanding the long-continued drought. The Strawberry plants were mulched with rough stable litter early in January, and they have withstood the dry hot weather well and produced a good crop, which began to ripen at least three weeks earlier than in ordinary seasons. Scarlet Queen ripened fully eight days before Noble, both growing side by side on a south border. The fruits are not so large nor so handsome looking as Noble, but they are much firmer and better in quality. Gooseberries, Raspberries, Black, White, and Red Currants were plentiful and of good quality in this district, but the

birds were troublesome upon those not netted.

Vegetable crops have suffered most. The early crops of Broad Beans are covered with black aphis, and the successional crops withered and died before coming into flower. Scarlet Runners are also infested with black aphis; the flowers are dropping off and pods not setting well. Peas have grown fairly well, but soon ripen and get too old for use. Onions, Carrots, and Turnips have made little progress, and I am afraid they will do little good this season. It is difficult with a short supply of water to keep up a succession of Lettuces; they are withering up in the drills before they are fit for use. The winter crops—Savoys, Broccoli, Brussels Sprouts, and Celery—are at a standstill, and in some places the plants of the Brassica family are still in the seed bed, where planting was delayed with the expectation of getting rain soon. Asparagus and Seakale, also Tomatoes trained on walls, luxuriate in this dry hot weather, which seems to suit them admirably; but Potatoes are losing their leaves and ripening off prematurely.

The loss among newly planted forest trees is very great. In some places (on the hills here) all those that were planted last season have perished, and we have lost thousands of Scotch Pine and Larch on this estate that were planted four years ago, and had grown to the height of 6 feet. The Larch plantations in this district are badly diseased this season, which may in some measure

be attributed to the long drought.

The Vines in the vineyards at Castle Coch, Swanbridge, and St. Quintin's Castle, never looked better since they were planted. They are covered with fruit, and the bunches are as forward now as they usually are at the end of August. The foliage is clean and healthy, and the young canes are stronger this year than ever I remember them.—A. Pettigrew, Castle Gardens, Cardiff.

INSECT PESTS.

INSECT pests are most abundant this year, and correspondingly harmful to plant life. I have, on former occasions, seen a greater plague of insects on the vegetation of a poor peaty soil, but have never witnessed anything like the same multitude in a garden. Up to the present the red spider has not made itself conspicuous in the garden of which I have charge, but various aphides are to be found on many plants, fruit trees, and shrubs. It is a marked feature of this insect visitation that vegetation growing in deep rich soil has kept comparatively free of the pests, while, on the other hand, plants growing in dry and shallow ground, as well as trees or shrubs which have stood a long period on the same site without having received any cultural help, have been infested with insects. This points most clearly to the beneficial aspect of

high cultivation as a deterrent to insect attack. It cannot, however, be regarded as a settled point, because Carnations in luxuriant growth have been much preyed upon, while Chrysanthemums in

pots have suffered from repeated attack of the aphis.

Hymenoptera have been very early afield and in great numbers. Three species at least of the humble bee have been largely represented. The mischief they confine themselves to, so far as the garden is concerned, is the destruction of Carnation and Pink flowers. Few of these have escaped them, and practically nothing can be done to prevent their visits. The common wasp is also more numerous than usual, hanging nests in particular being common. I do not much object to these, as at present and for a few weeks longer they are not frugivorous, but distinctly insectivorous. The foliage of infested fruit trees, more particularly Pears, is swarming with wasps. Some cottagers have been endeavouring to destroy those colonies settled in their gardens. Where hanging destroy those colonies settled in their gardens. nests are easy of access no better method of extinction need be followed than this. On a fire shovel place a few embers and keep them in a glow until wanted by means of a little added charcoal. Then throw a handful of flowers of sulphur on the glowing mass, and with this stupefy the wasps. Cut down the nest, letting it drop on the shovel, and few, if any, wasps will remain. Cyanide of potassium is sometimes applied to wasps in burrows, but unless the nest is dug out and destroyed within twelve hours the colony quickly resembles in vigorous life.

Respecting the eradication of aphis, and also of other insects which infest trees and other plants growing outdoors, it is as well to see whether anything cannot be effected in the way of helping the plant itself to greater vigour. To this end I advise the removal of all superfluous, and on that account hurtful growth. Take for example, an old wall-trained Rose tree. Even should the spring pruning have been well done there is now sure to be many weakly growths unable to produce buds, or in any way to further the well-being of the tree in general. Every one of these shoots ought to be removed. In the case of Plum trees, which are very subject to insect attack, similar measures must be followed; and the same remark applies to all kinds of trained trees. The benefit of thinning is apparent in the number of insects which are at once cleared out, as it is these worthless growths that harbour vermin. The vigour of the tree is also enhanced, and any help afforded in the way of water or manure at once reaches those shoots which are alone capable of receiving benefit. With the growths thus thinned remedial measures can be applied more successfully. There are fewer leaves to reach, and these are more easily cleansed.

For cleansing on a large scale I do not know anything better or generally easier to procure than soapsuds. Progressive laundresses do not now employ soda as a softener of water, but in cases where soda is used it is doubtful if it does any harm. To a large tubful of suds add a quart of petroleum, then with a syringe churn the suds until the mineral is assimilated. To any tree requiring cleansing apply this solution in the evening. Follow in an hour with another cleansing of pure water, and if the work is properly done few, if any, insects of any sort will be left. American blight succumbs to the same agent. In this case, however, it is necessary to direct with some force the spray from the syringe on the insectinfested spots. Currants and Gooseberries, which are sometimes attacked by aphis, are most expeditiously cleaned by removing the points of the shoots. I clean the buds of Carnations by means of a slight dusting of tobacco powder. Chrysanthemum shoots are

rendered clean in the same way.

Turning to the inmates of glass structures, the only difficult pest I have had to deal with has been mealy bug. During the time the heat lasted mealy bug multiplied with rapidity. Stephanotis in flower was attacked perhaps the worst; but also on some old Vines, which have given little trouble for many years, the pest increased most alarmingly. Asparagus in a hot stove also became quickly dirty. The break up of the drought brought a desired opportunity, and with one day's cleaning not many of the enemy was left. The Grape Vines took longest to clean, as it was needful to go carefully over every rod, shoot, leaf, and bunch, the latter with a camel hair pencil, the others with a sponge. I used as an insecticide a strong solution of softsoap, with a very small quantity of petroleum added. The sponge and the pencil were dipped in the solution, then squeezed almost free of moisture, and the insects thereafter touched lightly with either. The Vines will require to be looked to again in order to destroy those which escaped notice, and I am hopeful that not much mealy bug will be seen again for a long time to come. Stephanotis, Asparagus, Palms, and other plants not easily injured were syringed with a solution of soapy water and petroleum, followed closely with clean water. It is we'll to note that shade from sunshine is advantageous for a few days after cleansing.

It is curious to observe how insects attack the same plant year after year. I had a Vine which regularly developed red spider at

a certain stage of its growth. In another structure a Vine with the same regularity experienced an attack from thrips. On examination it was found that both Vines were growing in positions where they were likely to become dry at the roots more quickly than their neighbours. By increasing the supply of water along with an extra application of manure the insects have entirely disappeared. Thrips are almost always introduced to plants by maintaining a high temperature. In the case of a heat-loving plant like the Croton, one is apt to think that this could not be the case; but it is so if a hot drying sun shines directly on the plants. Red spider is most often brought into prominence by dryness at the root. Warm soapy water applied at about 110° is an excellent inscrticide for eradicating red spider. In all cases, however, it is best to see that there is no check to healthy root action, and if there is to remove the cause forthwith.—B.

STRAWBERRY FARMING.

DURING any ordinary season Strawberries should now be coming in (in bulk) from our English fields, but a visitor to any of the gardens in Hants or Kent would clearly see that for this year the picking is over. As a rule the crop lasts about a month, and 1893 has been no exception to the rule. Since the last fortnight in May the beautiful and wholesome fruit has been pouring into the London and provincial markets by the ton. Prices have been good, and many growers have had solid reason to rub their hands with delight; but although in some cases the returns have been far beyond the average, in others probably ruin, on account of the long drought, stares men in the face. As the season has been so exceptional, and the success of growers so diverse, it may be advantageous to look a little closer into the mystery of Strawberry farming, with the experience of the past three months still fresh in the mind, and inquire if anything can be done to ensure still further success another year.

It goes without saying that Strawberry growing is a paying occupation. I have watched the business for the past nine years in Hampshire, and have seen acre after acre laid down. Young men start with say half an acre, and after the second scason a pony-cart appears on the scene, and more land is taken up and planted. There must be money in the business. Further, it seems that Surrey is making a start, for I saw two large fields not far from Farnham a few days ago, and I honestly say that the plants and crop were fully up to the standard of Hampshire beds; and if Surrey starts, I see no reason why this crop should not be beds; and if Surrey starts, I see no reason why this crop should not be much more extensively grown in the south of England generally, for the demand for fruit is increasing, and even if the price realised is only 1s. 6d. to 2s. per gallon, the yield is quite three times the value of Potatoes grown upon an equal area, and the risks of failure are not nearly so great. Foreign fruit usually appears in advance of English, but we know well the superiority, not only in appearance and colour, but in flavour also, of our English-grown Tomatoes and Strawberries, and this superiority governs the market. Certainly all the returns come during one month, or at most six weeks of the year, and the labour is spread, more or less, over the other eleven months; but to men who contemplate taking allotments, if the land is fairly suitable as regards aspect and retentive power, I would strongly advise them to try a few rods of Strawberries, particularly if they are within reach of a fairly large town. There is room for speculation here. Many people hardly know the meaning of a gallon of Strawberries, who would be pleased to buy such for 2s. or 2s. 6d., fine freshly picked fruit, at 4d. or 5d. per pound.

I might say much more, but we propose looking at the experiences gained during the past three months, and to do this tersely and yet thoroughly is a difficult matter. I have certainly found it a general rule that the men who have done best are those whose plots are situated upon a fairly rich loamy soil with retentive subsoil, who have gone in heavily for autumn manuring and cleaning, and who have simply throughout the spring right up to the period of bedding up, kept the hoe at work, in many cases to such an extent that the surface (but surface only) soil was almost as dusty as the road.

Some have done well upon light soils, but only in cases where the soils have been consolidated by continual treading during the hoeing process. Whatever the class of soil, I believe most strongly that the hoe can account for much. A good porous gravelly subsoil for an early crop, but unless the season is a rainy one there is little chance of a month's picking. I am perfectly certain that any cleaning work done in the spring is disastrous, for the young fibrous roots of the plants make growth very early, and growers cannot afford to injure these and weaken their plants.

It is clearly seen that by continual hoeing the soil must be compressed, and evaporation retarded. Moisture is greatly needed for the Strawberry, as the size is thereby regulated; and it is only those who have watched the development of the fruit, and its wonderfully quick manner of filling out and ripening, who can testify to the importance for suitable soil and retentive subsoil.

There are many other points of interest that readily suggest themselves to the mind, but I may later on deal with the varieties most suited for market purposes, the modes of general cultivation in the Hampshire district, the gathering and marketing the crop, the treatment of the beds after the crop is off, and when running out of condition

The profit and loss account is hardly obtainable, as in many cases,

and perhaps wisely, the growers would not care to tell us much; but I must add that they are often deprived of a good share of their well-earned cash by the middleman. — EDWARD H. SMITH, Warminster.

Rose Show Fixtures in 1893.

July 6th (Thursday).—Bath, Farningham, Manchester, and Norwich., 7th (Friday).—Ulverston.

7th (Friday).—Ulverston.

11th (Tuesday).—Harleston and Wolverhampton.†

12th (Wednesday).—Earl's Court and Tunbridge Wells.

13th (Thursday).—Worksop (N.R.S.), and Woodbridge.

14th (Friday).—Helensburgh.

15th (Saturday).—New Brighton.

20th (Thursday).—Bedford and Trentham.

25th (Tuesday).—Tibshelf.

27th (Thursday).—Halifax and Southwell.

29th (Saturday).—Bedale.

† Show lasting three days.

-EDWARD MAWLEY, Rosebank, Berkhamsted, Herts.

NATIONAL ROSE SHOW AT WORKSOP.

I SHALL esteem it a favour if you will allow me to make the following communication to intending exhibitors through your columns this week. To the train leaving King's Cross at 10.40 P.M. of July 12th, the Great Northern Railway Company has kindly consented to attach a special van for Rose boxes. This train will take up at Hitchin. It will be met at Worksop, where it arrives at 2.18 A.M., and the boxes can, if exhibitors so wish, go direct to the Show ground and be placed in charge of a night watchman.

The next train out of King's Cross is 5.15 A.M. (morning of 13th July). This, Mr. Cockshott, the Superintendent of the line, tells me is one of the heaviest and fastest trains of the day, and on that account it will not be practicable to attach to it an extra van. Mr. Cockshott will, however, make arrangements for conveyance of exhibitors' boxes by this train, if I can give him some idea of the number of boxes and from what stations they will require to be conveyed. The train will take up at Retford at 8.20 and reach Worksop at 8.31 A.M. There is another train from Retford at 8.23, reaching Worksop at 8.40 A.M., and exhibitors joining the M.S. and L. system at Retford (especially those bringing much cargo) will find more accommodation by it than by the express.

From Sheffield exhibitors will find a van for their boxes on the train leaving at 7.15 A.M., and I am asking the Midland Company to make due provision on the train leaving Nottingham at 6 A.M. and Mansfield

at 7 A.M.

I shall be much obliged if exhibitors intending to make use of the 5.15 A.M. train will at once let Mr. George Baxter (our Hon. Secretary, 69, Bridge Street, Worksop) or myself know, as near as may be, what they will bring with them, and where they will join the train, so that I may be able to reply to Mr. Cockshott's inquiries. No doubt so far as the railway company is concerned the 10.40 P.M. train is best. It will be a help to the local Committee to know the number of boxes they will have to meet by the other trains, but this is of less consequence. JAMES SNOW WHALL, 31, Park Street, Worksop.

ORANGE FUNGUS ON ROSES.

I HAVE not seen Mr. W. G. Smith's "clear and well illustrated" contribution on this fungus in the "Rosarian's Year Book" for 1887. My experience of the parasite does not accord with "W. R. Raillem's" (page 497, last vol.). But different fungi are termed "Orange" that infest Roses besides the one above named, as Coleosporium pingue, Lev., and Dothidea Rosæ, Fr. I must also demur to your correspondent's dictum that it is the latter stage of Phragmidium mucronatum that does the most harm to Roses, for it is the mycelium of the fungus that does the whole damage, and this first produces the Lecythea Rose, whilst the Phragmidium is borne from the same mycclia and has none independent of the other.—G. ABBEY.

NATIONAL ROSE SOCIETY'S TEA AND NOISETTE EXHIBITION.

This was unquestionably the best of the series of Exhibitions that the Society has held, and the quality and correctness of the blooms were far in advance of any show of the kind held anywhere. We have had some in wet seasons, when the outer petals of the flowers had to be pulled off, and the blooms looked very naked; we have had others in showery weather, when the flowers were spotted and discoloured; but this long season of drought has enabled exhibitors to show their flowers in the perfection of colour and form. The date on which it flowers in the perfection of colour and form. The date on which it was held caught these flowers just in their prime, and I very much doubt whether at the Crystal Palace or elsewhere we shall see during the present season such a collection of Teas and Noisettes brought together.

The peculiarities of the season brought about some curious results, There has always been a keen competition between the growers of Tea Roses in East Anglia and the West of England. During the two last years victory has remained with the latter, but this year the course of things has been changed. It is true that Dr. Budd of Bath was sucoessful, but of our two champions, Mr. Alex. Hill Gray and the Rev. F. R. Burnside, we might well say "How the mighty have fallen!" Knowing well as I do the warm situation in which Mr. Gray grows his plants I was quite prepared to find that in this season he had suffered From the long drought and the invasions of thrips and other attendant calamities. I cannot quite as well understand Mr. Burnside's position, because last week he carried everything before him at York. I am told that his flowers there were of a very first-rate character, but I was sorry to hear him say that he doubted very much whether he should be able to put in an appearance at the Crystal Palace. But the East Anglian Rose growers were this year very much to the front. In the nurserymen's class all the principal prizes fell to the Colchester growers, Messrs. B. R. Cant, Frank Cant, and Prior & Son. It is true that at the trial of East Anglian parsons the Revs. H. A. Berners, F. Page Roberts did not put in an appearance, but the Rev. Foster Melliar exhibited in a form we have never seen before. His box of twelve was I think the most perfect one in the Show, and his bloom of Souvenir d'Elise which gained the N.R.S.'s silver medal as the best bloom in the Show, was a splendid flower. I have seen larger blooms of the variety, but never one in which the perfection of form and colour were more strikingly developed.

Another satisfactory feature of the Exhibition was the keen competition that took place in many of the amateur classes. There had been times when there were hardly stands sufficient for the prizes offered, and when the question arose whether some of those to which they were awarded were really worthy of it; but in the case of this Exhibition nothing of the kind occurred, for in many of the classes from seven to fourteen stands were shown; and although not very pleasant to those who were left out in the cold, it was more agreeable to those who won to know that they had had a hard fight for it. On some former occasions, too, a large proportion of the blooms had been either from walls or from houses, but I doubt very much whether there were any shown at this Exhibition that were not from the open ground, hence it more answered the wishes and expectations of the Society, which never intended that it should be a show for Teas and Noisettes under glass. Although the general character of the flowers was that which I have endeavoured to describe, one of great excellence, there were few blooms that stood out pre-eminently grand. There were some fine blooms of Comtesse de Nadaillac and Souvenir de Thérèse Levet in Mr. Foster-Melliar's stand, very bright, though a colour, I think, out of place amongst the delicate and refined Teas. One of the most remarkable blooms in the Exhibition was one of that fine Rose of old Margottin's, Boule d'Or, shown in Mr. Budd's stand of Bath, one nearly equally good being in Mr. Foster-Melliar's stand. Marie Van Houtte was exhibited in many stands in excellent form, having that beautiful yellowish ground with pink on the edge which is really its true character. Mr. Grahame of Croydon had also some excellent blooms, and it is pleasant to find that both he and Mr. Foster-Melliar, who have done so much to instruct rosarians by their writings, have shown that they can carry into successful practice theories they have advocated.

It is hardly necessary to say that in the stands from Colchester in the nurserymen's class there were a number of very superior blooms; indeed, as I stood by the experienced amateurs who judged in this class I was struck by the high number of points given to each stand. can I omit a word of praise to the beautiful dozen of Maréchal Niel exhibited in this division. It is a somewhat curious thing that although the Society offers very good prizes for a decorative arrangement of Teas and Noisettes in basket, vase, epergne, or indeed anything suitable, we never seem to be able to get beyond three competitors. The competition is confined to ladies, and the Committee had hoped that there would have been a larger number of them to enter the lists. The three competitors is this instance were Mrs. Orpen of Colchester, Miss Bloxam, and Mrs. Mawley, to whom the prizes were awarded Mrs. Orpen's was a delightful arrangement in in the order named. which apricot colour predominated. Miss Bloxam had a very neatly arranged basket, the foliage of which mainly consisted of the leaves of Rosa rubrifolia, the dark colour of which afforded a good contrast. Mrs. Mawley's arrangement was very pretty, and the Roses in it were excellent in quality.—D., Deal.

CANKER IN FRUIT TREES.

THE following cutting from the "Revue Horticole" may be interesting to your readers:—"It is now known that the cause of canker in fruit trees is a microscopic fungus named Nectria ditissima, which rapidly extends its ravages, but which can be effectively brought under control. For this purpose the cankered parts should be cut away and dressed with a pruning knife, after which a mixture of the bouillie bordelaise containing 3 per cent. of sulphate of copper and 6 per cent. of lime should be applied to the affected parts with a paint brush. This application may be repeated once or twice in the course of the summer." This, it will be seen, bears out Mr. Abbey's remarks on page 115 of the Journal of Horticulture, February 9th of this year.—ONE INTERESTED.

WHATEVER may be the cause of canker in fruit trees, there certainly is a great deal more of it when a severe winter follows a cold wet summer. Is it because the sap is frozen and bursts the cells, causing a rupture through which the sap comes, forming a gummy substance? When a dozen trees of one sort are planted, and only one is cankered, may not that one be rooted deeper, or in some way have more moisture at the root, causing it to grow later, and consequently get the sap frozen in it while the others escape? Has anyone noticed whether those varieties most subject to canker are naturally later in finishing their growths?

On February 16th, 1892, we had 38° of frost here, which killed

many branches of fruit and other trees; and as we had mild weather previous, which caused the sap to move, may I ask if the cause of death would be frozen sap? These are only thoughts from observations of canker after severe winters, and are not proven facts of canker from that cause.—B. L. J., Leicester.

THE above is such an important matter that in a paper that treats on pomology so fully as the Journal of Horticulture no apology is needed to introduce the subject. I have not the pleasure of the personal acquaintance of Mr. Abbey, but I have reason to think that his theory of the cause is the right one, and that the remedy for the cure is a good one which was fully detailed by Mr. Abbey in the Journal of Horticulture early in the present year. I purchased the necessary ingredients at a chemist's in our nearest market town, and mixed it according to the directions given, and applied it to seventy standard Apple trees which have been planted, some ten and others fourteen years, thirty-four pyramid Pear trees, and twenty-four espalier Apple

trees, mostly of about twenty years' growth.

What caused my anxiety with regard to canker was this. Some of the first planted Apple trees (standards) were very healthy, with fine heads; but in the autumn and winter of 1892 I noticed several trees badly attacked with canker, notably Cox's Orange Pippin and Warner's King; and among the Pears Glou Morçeau and Seckle. I applied the remedy, and I am pleased to say that the trees are already healthier. Canker seems to be arrested, and the trees are carrying a fine crop of fruit. I shall have to prop many of the Apples and Pears, and the trees that were dressed with the canker mixture were not nearly so much affected with caterpillars as those trees left undressed. We have a new orchard containing several hundred trees, and I hope to

dress the trees in the same manner next year.

Why I think Mr. Abbey's theory of fungus being the cause of canker, and being propagated by spores carried by the wind, insects, or other means of infection, is this. In the early spring of 1891 I purchased some new maiden Apple trees, thinking to form them into espaliers. procured them from a good source. Among them was a plant of the new Apple Bismarck. They were clean, healthy little trees on the Paradise stock. For want of other space I was obliged to plant this particular tree of Bismarck near to a tree of Old Hawthornden which was affected with canker, and in the autumn of 1892 I noticed one of the branches on the small tree of Bismarck was cankered, which I have enclosed for your inspection. Now, in this case the soil was good, the roots near the surface, and the ground had been specially dressed with supposed antidotes to canker and its cause in the soil.—R. MAHER, The Gardens, Yattendon Court, Newbury.

NIGHT-BLOOMING CEREUS.

MR. MARK B. F. MAJOR is, I think, mistaken in supposing Cereus Macdonaldiæ to be the plant which was lost a number of years ago in Journal for June 12th, 1884, page 464, he will find a paragraph on the same flowering at Cromwell House under the care of the late Mr. W. Wright. The bloom when expanded measured 14 inches across. On the following week, June 19th, page 492, the plant is mentioned again. The variety referred to is the result of a cross between C. grandiflorus and C. speciosissimus. It was a remarkably fine healthy plant, trailing with other night-bloomers over a large wire arch figured in the Journal for May 22nd, 1884. I have had the pleasure of seeing it in flower on more than one occasion since then. It was raised by Mr. Kenny, gardener to Viscount Maynard, Easton Lodge, Dunmow.—G. W.

Mr. Major's very clear description of some varieties of this Cactus enables me to determine with more confidence that my free-flowering variety is Cereus grandiflorus. Will you once more extend the courtesy of your columns to me to ask any grower of this Cereus what is the greatest number of blooms he has had on any one evening on one plant? Mr. Major says, "We seldom had more than one, and I think never more than two out on the same plant at one time." This, as far as it goes, seems to bear out my idea that nine fully expanded blooms of Cereus grandiflorus on one plant on the same evening may be a very unusual, as it certainly is a very magnificent display.-RICHARD J. HILTON.

[It is recorded in the Journal of Horticulture, page 422, May 29th, 1884, on the authority of Mr. Siddal of Chester, that a large specimen of Cereus grandiflorus in a house at Pendyffryn, Wales, has had from sixty to eighty flowers open at one time.]

EVENTS OF THE WEEK.—Horticulturists will be busy during the ensuing week. Apart from the Rose shows, a list of which is given on another page, several events of special horticultural interest will take place. As mentioned elsewhere, the Royal Horticultural Society will on July 11th have an exhibition at Chiswick, with which the show of the Carnation and Picotee Society will be held. On the following day a special show of Roses, Carnations and fruit will take place at the Gardening and Forestry Exhibition, Earl's Court, whilst in the evening the Worshipful Company of Gardeners will dine at the Hôtel Métropole. Wolverhampton Floral Fête opens on the 11th inst. Woodbridge (Suffolk) Show will be held on the 13th. A great Orchid sale will take place on Friday next, the 7th, at Messrs. Protheroe & Morris' Auction Rooms.

- THE WEATHER IN LONDON.—Warm, bright weather again characterised the greater portion of the past week. Sunday was very hot, and the same may be said of Monday. Tuesday was likewise warm tut less sunny than the three preceding days, and a refreshing rain fell at night. Wednesday opened cloudy but very warm.
- —— Show Reports.—The crowd of Rose and other shows is so great that it is impossible the whole of them can be reported, but efforts are made to report those which have been advertised in our columns, or exhibitions of general interest of which schedules have been sent and reporters' tickets received. Reports arriving on Wednesday morning, and for which no space has been reserved, are too late for insertion. We desire to thank all correspondents who send us notes on local shows and matters of public interest.
- CARNATIONS AND PICOTEES AT EARL'S COURT. Arrangements have been made for Carnations and Picotees to be exhibited at the Rose and Fruit Show to be held at the Gardening and Forestry Exhibition, Earl's Court, on July 12th. Seven classes are provided in the supplementary schedule just issued, and liberal prizes are offered.
- THE employes of Messrs. RICHARD SMITH & Co., St. John's Nurseries, Worcester, had their nineteenth annual excursion on Monday, the 19th ult. Llandudno was the place chosen for this year's outing, and accompanied by their wives and friends, the whole party numbering 450, travelled by way of the Severn Valley in a special train of carriages provided by the G.W.R. Co. The firm have intimated their intention to close their nurseries and seed establishment to-day (Thursday), in honour of the Royal wedding, and to pay their employes for the day as usual.
- WOODBRIDGE HORTICULTURAL SOCIETY.—The annual Exhibition of this Society will be held in the Abbey Grounds on Thursday, July 13th. Roses form a special feature at this Show, the principal prize being a 25-guinea challenge cup with the National Rose Society's silver-gilt medal for twenty-four distinct varieties. The competition in this tempting class ought to be keen.
- WOLVERHAMPTON EXHIBITION FLORAL FETE.—This annual event will be held in the Public Park, Wolverhampton, on July 11th and the two following days. A liberal prize schedule has been prepared, and in addition to the money awards for plants, Roses, flowers and fruit, gold, silver, and bronze medals are offered for exhibits of Pansies and Violas.
- CHISWICK GARDEN FLOWER SHOW.—On Tuesday, July 11th, the Royal Horticultural Society will hold a special flower Show in the Chiswick Gardens, which are close to Acton Green, Turnham Green, Gunnersbury, Chiswick, and Kew Bridge Stations. The Fruit, Floral, and Orchid Committees will meet at 11 A.M. precisely. Lady George Hamilton has kindly consented to distribute the prizes in the afternoon. The band of Her Majesty's Royal Horse Guards (Blues), under the direction of Mr. Charles Godfrey, R.A.Mus., will perform during the day. The Exhibition will be open to the public from 1 to 8 P.M. The Fellows of the Society and special subscribers will be admitted at twelve o'clock noon. Intending exhibitors should communicate the nature of their exhibits to Mr. Barron at once, so that the proper space can be allotted.

- —— FRENCH HONOURS.—We learn from Nature that the French Academy has awarded the Prix Desmazières to M. P. Viala, for his researches on viticulture; the Prix Montagne to M. l'Abbé Huc, for his work in lichenology; and the Prix de la Fons Mélicocq to M. Maseleff, for his work on the Botanical Geography of the north of France.
- AWARDS FOR SCIENTIFIC AGRICULTURE. We understand that the Albert medal of the Society of Arts for the present year has been awarded to Sir John Bennet Lawes and a like medal to Mr. John Henry Gilbert "for their joint services to scientific agriculture, and notably for the researches which throughout a period of fifty years have been carried on by them at the experimental farm, Rothamsted."
- BULBOUS IRISES.—The lecture on "Bulbous Irises" given by Professor Michael Foster at the meeting of the Royal Horticultural Society on May 8th, 1892, has been published in pamphlet form. Some of the species are illustrated, which enhances the eighty-five pages that form the brochure. Much useful information is conveyed in the lecture, which is well worth a perusal by all admirers of these beautiful flowers.
- HEUCHERA SANGUINEA.—Looking over a large bed of this beautiful hardy plant I saw the other day growing in Mr. B. Ladham's nursery at Southampton, I was struck with the rich colour found in one seedling plant, that gave at once darker foliage and larger flowers, of more intense colour. This is a form that could hardly help displacing the common variety. When it becomes abundant it will probably be termed atropurpurea.—A. D.
- A USE FOR TOMATO LEAVES.—An Indian paper remarks, "Tomato leaves have proved to be of value in an unexpected direction. It has been found that water in which a quantity of fresh Tomato leaves have been steeped, when sprinkled over Peach, Roses, and Orange trees, had the effect of totally routing the numerous insects of all kinds which infested the trees, and in two days' time not one of these pests was to be found." A trial would be interesting.
- THE DAISY PEA. I saw this fine dwarf Pea growing admirably at Claremont, Esher, recently, and Mr. Murrell is greatly taken with it. In height and appearance it much reminds me of Robert-Fenn Pea, a very delicious dwarf Marrow it was my fortune to raise some years ago by crossing Premier, a variety then well known, with Little Gem. The Daisy Pea should be in great request for cottagers and allotment holders who wish to utilise to the utmost every inch of their soil.—A. D.
- Double Annual Chrysanthemums.—Amongst the annual Chrysanthemums flowering outdoors the new double varieties promise to give excellent results. They are dwarfer than the single forms. A great per-centage of them come perfectly double, and the colours cover many shades we looked for in vain amongst the single varieties. For cutting they are of great value, remaining in perfect condition for several days. When once they become better known they are sure to be extensively grown.—R. P. R.
- Wakefield Paxton Society.—At the meeting of the members of this Society last week Mr. J. G. Brown, gardener at Hatfield Hall, read a practical paper, in which he clearly and fully explained the best mode of cultivating Strawberries, and named some of the best varieties suitable for the soil in the district. He also explained the manner in which Strawberries are grown in Kent, in the district of Bath, and at other places where they are extensively cultivated. A long and interesting discussion followed the essay.
- A DIGGING COMPETITION.—The monthly meeting of the Widcombe Institute Horticultural Club, held recently, took the form of a digging competition. At half-past seven a large number of members assembled at Wansdyke, Claverton Down, the residence of Mr. R. A. Moger, the Hon. Secretary, and proceeded to a large garden at the rear of the house, where the space set apart for the digging had been marked out. Each competitor, who could use a fork or spade, had to dig half a perch of ground in a manner most suitable for a crop of Cauliflower or Broccoli, and to use the manure provided in the way he considered most suitable. Seven entered for the contest, and their work was watched with interest by the spectators. Messrs. T. Collett and W. Crew were the Judges, and points were given for time, style, and the application of manure. The Judges had a considerable difficulty in awarding the prizes, but finally the first was given to Mr. Wale, the second to Mr. Ball, and a third prize (kindly given by Mr. Heafield) to Mr. F. Hooper, Mr. G. Hooper receiving a certificate of merit. After the competition the company adjourned to the lawn of Wansdyke, where Mrs. Moger provided an excellent supper.

- —— GARDENING APPOINTMENT.—Mr. Henry Angus, late general foreman at Wykeham Abbey, Yorkshire, has been appointed gardener at Coupland Castle, Wooler, Northumberland.
- TROP HOLUM MRS. CLIBRAN.—This is unquestionably a great acquisition to our list of bedding Trop colums. Throughout all the dry weather the plants have been covered with bloom. It associates well with the scarlet variety Fire King.—R. P. R.
- ALEXANDER PEACH OUTDOORS.—I began to gather this early Peach on June 23rd. Early Beatrice will soon be ready. This is exactly four weeks in advance of last year at this place (North Hants), showing what effect the excessive heat and drought has had on Peach trees.—H. C., Froyle Park.
- Mr. Joseph Theobald.—This faithful servant of Mr. George Bunyard and much respected man died on the 29th ult. after a short illness. He was for thirty years "florist" foreman in the Maidstone establishment, previously with Mr. B. Cant of Colchester, and was well known in the southern counties.
- —— DR. NANSEN'S ARCTIC EXPEDITION.—We are requested to state that Messrs. Cadbury, of Bournville, have supplied about 1500 lbs. weight of their cocoa essence and chocolate in hermetically sealed tins, as a portion of the provisions, which must keep good for at least seven years, taken for this expedition.
- THE WEATHER IN HERTFORDSHIRE.—Mr. E. Wallis, The Gardens, Hamels Park, Buntingford, Herts, writes:—"The weather during the past month has still remained exceptionally dry and bright, there being only one full dull day. Rain is everywhere needed. During the past four months only 2.67 of rainfall have been registered. Rain has fallen on eleven days during the past month. Maximum in any twenty-four hours was 0.25 on the 22nd; minimum in any twenty-four hours was 0.01 on the 25th. Total during the whole month, 0.88, against 2.71 of 1892."
- AWARDS AT THE EARL'S COURT SHOW.—Extreme pressure on our space last week prevented us mentioning that Messrs. W. Paul and Sons, Waltham Cross, were awarded a silver-gilt medal for a charming collection of Roses at the Earl's Court Show on June 28th. Mr. W. H. Divers, Ketton Hall, Stamford, secured a silver medal for some well-grown Peaches; Mr. J. R. Chard, Stoke Newington, for floral decorations; and Mr. J. Forbes, Hawick, for a collection of Delphiniums. Extra prizes were awarded to Messrs. T. Rivers & Sons for a collection of fruit; J. Cheal & Sons, for cut flowers; Jarman & Co., for vegetables; and W. Berridge, for Tomatoes. First-class certificates were awarded to Mr. T. S. Ware for Begonias Queen Victoria, Champion, and Miss Fanny Fell; Mr. W. Allan, Gunton Park Gardens, for Strawberry Gunton Park; and to Mr. Anthony Waterer, Knaphill, for Spiræa "Anthony Waterer," a very dwarf growing pink flowered form.
- ALLOTMENTS AT RICHMOND.—Two years since a large demand for allotments in Richmond having arisen, the Corporation, as the local authority under the Allotments Act, sought to obtain a portion of the Old Deer Park for the purpose, but failed. Effort was then made to obtain land in another direction, and eventually some 20 acres that had been for many years under market garden cultivation, and situated between the Sheen Road and the South-Western Railway on the eastern side of the town, were secured; this the Corporation obtained a long lease of, and after setting out roads, marked off into 196 allotments in areas ranging from 10 to 20 rods. The ground is of an excellent nature, but had been worked only some 10 inches deep at the most, and whilst this season for the first time is, in spite of the drought, carrying excellent crops, yet will be greatly improved when more deeply worked and manured. The allotment holders comprise men engaged in every description of occupation, not a few had ever had a garden or allotment previously. The general aspect of the plots is excellent; cropping is perhaps too crowded, but that will be amended by time; weeds are entirely absent, and in every part there is remarkable neatness. The appreciation in which the allotments are held is indeed in many cases bordering on enthusiasm. The men seem as if a new life, with new aims, desires, and enjoyments had opened up before them. A more complete vindication of the capacity of workers of all descriptions to properly cultivate and appreciate allotments cannot be found in the kingdom: On Saturday 24th ult., representing the Surrey County Council Technical Education Committee, Mr. A. Dean, Kingston, inspected the allotments and afterwards addressed the workers on the ground, describing the best methods of cultivation, forms of cropping, dealing with plant pests, and was listened to for an hour with the deepest interest.

- MARGARET CARNATIONS.—Plants of these Carnations appear to be wonderfully quick in producing flowers. I sowed some seed about the middle of February and grew the plants in heat, afterwards giving them cool treatment, finally planting some outdoors. These and others in pots standing out of doors are now full of buds.—E. M.
- THE GUNTON PARK STRAWBERRIES.—I fully agree with Mr. Dean of Kingston in his estimate of the Strawberries he refers to on page 521. I have had the pleasure to receive a box of each variety. They travel well, and are in colour, shape, and flavour excellent. I think they are worthy of a trial in large and small gardens.—John Andrews, Hon. Sec. to the Woodbridge Horticultural Society.
- THE PHYLLOXERA.—It is reported that "the phylloxera has appeared in the vineyards of the province of Trapani (Sicily), in which Marsala is situated. This is the only province of the island which has hitherto been exempt from the visitation. The districts where the disease has been discovered are Alcamo and Partinico. A Government-commission has been despatched to the spot to combat the scourge."
- SUN HEAT.—Mr. S. Arnott, referring to the "intense heat" near Dumfries on Monday last, says the thermometer hanging against a wall in the full sun registered 100° at 2.45 on Monday last. This would indicate pleasant weather to some southerners, who have languished under 90° in the shade this year and 120° in the sun. We have known this heat exceeded on more than one occasion on a south wall.
- EXHIBITING RASPBERRIES.—It is a common occurrence to see these exhibited without stalks at cottage shows, and even amongst amateurs the practice is prevalent; but I do not remember having noticed a gardener stage them in that way. It is difficult to initiate the former in the correct method of presenting all their exhibits, but the latter should surely need no such drilling. They would hardly send fruit as dessert to the table minus the stalks.—E. M.
- Canterbury Bells.—These plants make a grand display in the borders during May, June, and July. If the seed is sown late in the year the plants are weakly in the autumn, and from them strong flower spikes cannot be had. The middle of June is a good time to sow seed of any approved variety. Dean's strain I consider very good, the colours being decided, and the flowers large. The single flowers are the most effective. If the weather is dry, well water the ground a few hours before sowing the seed. Cover the seed thinly with fine soil, and shade the bed until the seedlings appear above ground, when they should have all the light available to induce a sturdy growth. When the plants are large enough to handle put them out where they are to flower, or in well dug land 8 inches apart until the autumn.—S.
- ROYAL METEOROLOGICAL SOCIETY.—The last meeting of this Society for the present session was held on Wednesday evening, the 21st ult., at the Institution of Civil Engineers, 25, Great George Street, Westminster, Dr. C. Theodore Williams (President) in the chair. Mr. R. H. Scott, F.R.S., read a paper on "Fifteen Years' Fogs in the British Islands, 1876-1890," which was a discussion of the fog observations made at the stations which appear in the "Daily Weather Report." The winter is the foggiest season, and the greatest number of fog observations are reported from London, Yarmouth, Oxford, and Ardrossan. In the summer half year the fog prevalence attains a local maximum in two different districts—viz., at Scilly, St. Ann's Head, and Roche's Point in the south-west, and at Sumburgh Head and Wick in the north. These are evidently sca fogs, accompanying warm weather. Mr. Scott has made a collation of the observations of fog and the force of the wind, and finds that fog almost invariably occurs only with ealm or very light winds. The author says that it seems to be generally assumed that fogs in London are increasing in frequency and in severity. From the observations it appears that there is no trace of a regular increase either in the monthly or in the annual curve. All that can be said is that taking the three lustral periods of five years each, the last of these (1886-90) comes out markedly the worst, the successive totals being 262, 250, and 322. A paper on "Upper Currents of Air over the Arabian Sea," by Mr. W. L. Dallas, F.R.Met.Soc., of the Indian Meteorological Office, was also read, in which it is shown that there exists a regular arrangement in the vertical succession of the upper currents; and that the Doldrum region, and not the geographical equator, is really the dividing line between the currents of the northern and southern hemispheres. Mr. E. D. Archibald, M.A., F.R. Met. Soc., also gave an address on "Australian Climate and Weather," which was illustrated by a number of interesting lantern slides.

Cambridge is about to institute an examination in agricultural science. The subjects of examination—each subject of course treated with special reference to agriculture—are botany, chemistry, physiology and hygiene, entomology, geology, mechanics and engineering, book-keeping, and agriculture. The last, however, with surveying, veterinary science, and economies in relation to agriculture, will, or may, form part of a further examination to be taken after the others. The candidate who has passed both will be entitled to a diploma, and the candidate who has passed one to a certificate. It is also recommended that the managing syndicate shall entertain applications for the appointment of persons to inspect schools of agriculture or horticulture that receive grants of public money, and give regular instruction in these subjects.

Gas Lime.—I note "A. D." (page 500) advises the use of gas lime on land in the occupation of allotment holders for the purpose of preventing the Onion maggot injuring the crop. While admitting its efficacy, I would caution those persons to use the lime very sparingly, as only last year I saw a garden where it had been used too freely during the previous winter, and the crops of all kinds were in a most deplorable condition, seeds of Onions, Carrots, and Beet failing to germinate. In some cases at least three sowings were required, and transplanting from other gardens was necessary to obtain a crop. In looking over the same garden a week or two back, I remarked how well the crops looked. The Potatoes were in marvellous health considering the extreme drought experienced, the haulm was high, erect, and the foliage deep green. Far better use the lime sparingly and often, rather than to dress heavily.—E. M.

— KINGSTON GARDENERS' ASSOCIATION. — The usual monthly meeting of this body was held at the Edenholme school-room on Tuesday evening, on 27th ult. There was a large attendance. Mr. Cushon occupied the chair. Some good examples of Thorpe's Queen and Sutton's Matchless Marrow Peas, both very fine varieties, and some sports from the former were exhibited by a member. Mr. Yeabsley, gardener to Mrs. Bryant, Surbiton, read a very practical paper on the Indian Azalea, from which much useful discussion arose, and a cordial vote of thanks to the reader was accorded. Mr. Dean read a letter from Messrs. Sutton & Sons, Reading, respecting the visit of the Gardeners' Cricket Club to their firm next Wednesday, giving a cordial invitation to members to see over their nursery trial grounds, also from Mr. Greig, station agent S.W.R., announcing a large reduction of the ordinary fare to and from Reading to members of the Association.

SUSSEX RAINFALL.—The total rainfall at Abbots Leigh, Haywards Heath, Sussex, for June was 2.44 inches, being 0.64 above the average. The heaviest fall was 1.31 inch on the 19th. Rain fell on nine days. The total fall for the six months was 9 inches, which is 3:17 inches below the average. The highest temperature in shade was 90° on the 19th, the minimum 37° on the 1st. Mean maximum, 69.22°; mean minimum, 48·26°; mean temperature, 58·74°—1° above the average. The drought in the above-mentioned district lasted for fifteen weeks. During the four months (100 days) rain fell on only twenty-two days. From March 2nd to June 19th only 1.10 inch rain fell, and with the exception of a few days (from the 15th to the 20th May, when it was dull and showery, with a thunderstorm), the sun was all the time remarkably hot, and the wind hard and parching, and an almost entire absence of dew at nights. Crops have suffered much; watering seemed to have little effect. Early Potatoes have so far matured that they will have to be lifted as speedily as possible to prevent them growing again. The intense heat of the middle of June ended in a severe thunderstorm, during which 1:31 inch of rain fell in an hour, doing some damage; it was followed by a few dull days and more showers, that have done much good. The first two days of July has been quite hot, and every appearance of its continuing.—R. I.

BEGONIAS AT SWANLEY.

It is always a pleasure to visit the Home of Flowers, as Messrs. H. Cannell & Sons' nursery at Swanley is named. There are flowers in abundance to be seen whenever one may go, and my visit was chosen when I thought the Begonias, for which the Swanley firm is justly eelebrated, were at the zenith of their beauty, and amply was I repaid for my journey. Several large structures are devoted to these beautiful plants. Begonias are, however, to be seen everywhere—in the houses, and in the open air. Innumerable varieties are grown, as many readers of the Journal who have seen them will know.

Apart from the named kinds there are many thousands of seedlings which have not yet flowered, and from these it is anticipated many new and excellent sorts will be selected. I will give a list of some of the

best that were in flower at the time of my visit, commencing with the double varieties, amongst which Cannell's Rosebud stands pre-eminent. It combines all the good points essential in a first-rate Begonia. The blooms are the shape of a good Camellia flower, but are larger, the petals overlapping each other in precisely the same manner as is so much admired in that popular flower; the colour is a delicate pink of the most pleasing shade of colour. There were many flowers showing blooms of what would by many be considered perfect, so excellent were they, but not like Rosebud. General Owen Williams is one of the most floriferous, its large erimson blooms full of substance standing out boldly above a dwarf compactly habited plant. A distinct and pleasing flower is found in Thos. Whitelaw. The flowers are of a soft fawn charmingly shaded buff, and have a very elearly defined edging of rosy red. The various colours blend with the most perfect harmony, and form a combination which cannot fail to please the most fastidious. Miss Nora Hastings bears a flower somewhat after the same style, the ground colour being soft fawn with the back of the petals rosy salmon, with the blooms large and substantial. For a beautiful clear yellow Miss Falconer would be difficult to equal. The habit of the plant is fine, and the flowers, which are of good size, are borne in profusion.

Amongst the deep salmon shades Sir J. D. Hooker is perhaps one of the finest. The blooms are of great size and extraordinary substance, and show above the foliage in an admirable manner. Llangattoek, which received an award of merit at the Temple Show, is one of the richest crimsons, with flowers of excellent shape and immense size. For a Begonia suitable for culture in a basket I can conceive nothing better than Miss E. Wynne, the flowers of which are pure white, and droop in an exceedingly graceful and faseinating manner. One of the prettiest is Mrs. Cornwallis West, the colour of which is most uncommon, and can only be described as a soft yellow shaded with apricot, the centre petals being of a delicate cream shade edged with pink. Octavia is a beautiful variety with pure white flowers borne with astonishing freedom. Though the blooms are small in comparison with many others, this is a variety which should be included in every collection. Madame la Baronne de St. Didier has a very large flowers of a soft yellow colour, and is one of the most striking varieties in the eollection. Flamingo, as is implied by the name, is a brilliant searlet eoloured variety. The flowers are plentiful, of good shape, and the habit of the plant is perfect. Cannell's Gem is the freest flowering variety in the whole collection, and will be most popular when it becomes known. The habit is good, and the bright searlet flowers very ereet. Throughout the collection it is noticeable what a preponderance of varieties there are which earry their blooms perfectly erect instead of hanging over, as was the case with almost all but a very short while ago.

From amongst the singles it is even more difficult to make a selection, the flowers on the majority of the plants being large, substantial, and of good shape. Mrs. John Thorpe was, however, one of the very finest and most effective, the ground colour being white, and having an edging of what can only be termed a reddish lake. The plant is most floriferous and the habit excellent, the flowers standing boldly above the healthy leafage. Miss Agnes Stewart is a variety with immense flowers, colour being soft yellow clearly edged with pink. One of the most prominent is Mrs. W. H. Forster, the brilliant red flowers of which have a pure white centre. The massive shapely flowers of Colonel Kidd, of a deep red shade, are very attractive; as also is Mr. Packe, which has soft rosy red flowers, flushed and shaded light rose. It is one of the most distinct colours I have yet seen, either amongst Tuberous Begonias or any other flowers. The orange-buff flowers of W. Marshall are singularly beautiful. This is a colour which should be increased, as it will most assuredly be most popular. One of the brightest flowers is Earl Grosvenor, orange-searlet, with blooms of great size and substance. There were many other varieties equally well worthy of mention, but time, the inexorable, would not allow me to take notes of more, much as I should have liked to do so.—Nomad.

THE ROYAL HORTICULTURAL SOCIETY'S FOUR DAYS' SHOW.

THE remarks of "A Fruit Grower and Exhibitor" anent this subject, on page 480 of the Journal of Horticulture for June 15th, seem to me to be both forcible and opportune. Judging from my experience of exhibiting I am convinced that many would-be exhibitors will be prevented competing at the Show in question if the produce staged in the fruit classes has to remain four days before removal. Many employers who grow fruit largely would strongly object to having their finest specimens eneased in the thick coating of dust which would result from so lengthy a sojourn in a crowded room or tent; and, moreover, such a practice is calculated to bring shows into disrepute, for some of the finest dishes frequently look the reverse of inviting at the end of a two-days show. This seems to be the opinion of some of the leading judges at the metropolitan shows, who look with extreme disfavour upon any produce exhibited which is not perfectly fresh, and I have frequently seen them leave unplaced dishes of fruit only because they had been staged at another show a day or two previously, although they were superior in other points to the winning dishes. Granting this is the right course to pursue, does it not conclusively prove that a four-days show is a step in the wrong direction?

Another point to be considered is the expense attending so long an absence from home. In the case of those at a considerable distance from

London all who compete cannot win, and many will prefer not to measure their strength with the veteran showmen, if the result of failing to win a coveted prize is also to bring them considerable loss financially. For these, as well as the weighty reasons pointed out by "A Fruit Grower and Exhibitor," I trust the Council of the Royal Horticultural Society will see their way to give some relief to would-be exhibitors.—A MIDLAND COUNTIES FRUIT GROWER.

FLOWERS AT THE ROYAL WEDDING.

TWICE within a few months the walls of historic Fleet Street have resounded with the cheers of the multitude over a spectacle in which the products of the garden play an important part. In November last the pageantry of the Mayoral procession through the main thoroughfares of the ancient city was varied for the first time in history by a trophy of British fruit which aroused the enthusiastic plaudits of the lookers-on, and to-day there is a deeper swell in the myriad voices which cheer on the bride and bridegroom of an hour as they pass with the music of a thousand joy-bells and the perfume of a million flowers beneath the windows of the Journal of Horticulture. It is not the function of an organ which for nearly half a century has been devoted to furthering the interests of horticulture to dwell on the general features of an occasion such as this, moving and tremendous though they may be; but it is within its province to refer with pride and rejoicing to the floral aspects of a ceremony which has evidently stirred the heart of the nation deeply, and called forth a demonstration almost pathetic in its intense and spontaneous delight. Grim, repellent London, mighty assemblage of gloomy streets, to-day blossoms like the Rose. It has garlanded itself with flowers to do honour to the event which unites the heir to the throne of Britain with one of the most gracious and beloved of her daughters, and they could have but a shallow love for horticulture who would fail to derive satisfaction in observing how largely its resources have been drawn upon for an occasion of such national and historic

Considering how universal the custom of associating flowers with every function which it is desired to invest with beauty and refinement has become, it is not surprising that on an occasion of such supreme importance they should play a prominent part. The Society hostess who spends hundreds of pounds in order that her guests may listen to the most gifted artistes of the opera does not hesitate also to provide them with other pleasures in the form of costly floral decorations, for without them her rooms would be cheerless; nor is expense spared to procure all that is rarest and most lovely in flowers at balls and other And these are but events of the hour, exciting no social assemblies. comment outside the Society journals. In the wedding of H.R.H. the Duke of York and Her Serene Highness the Princess Victoria May of Teck we have an event which is talked of in Birmingham as well as in Belgravia, in Manchester as well as in Mayfair, and which excites the same interest in the village cottage as in the town mansion. Strange therefore would it be if in bowing to the wishes of the nation for a ceremony in which it could openly testify its gratification and pleasure the treasures of the garden had been overlooked.

Few, perhaps, of the thousands to whom the floral appurtenances of the Royal nuptials have proved an object of interest were able to form any impression of their value or of the magnitude of the task of preparing them, contenting themselves with a casual admiration. But those to whom flowers represent something more than the value of a glance not unnaturally seek to get at least an approximate impression of the principal material, and the extent and manner of its utilisation. A call on Mr. Thomas at Windsor, and an inspection of his labours at St. James's Palace and in the Chapel Royal, together with a visit to Mr. Wills at South Kensington, have demonstrated on how magnificent a scale those gifted horticulturists have carried out the duties allotted to them. Her Majesty's gardener has had to fulfil the task of embellishing the Palace and Chapel referred to with plants and flowers, and the work has been carried out with an ability and completeness which could hardly have been excelled. Our representative called in the height of the preparations. Every group, whether large or small, every window arrangement, and every floral device, such as pillar wreathing, that was subsequently displayed at St. James's, had the various plants allotted and placed together at Frogmore in the approximate order of their later arrangement, so that when conveyed to their destination the "dress rehearsal" could be followed by a rapid, smooth, and effective manipulation of the material. The recourses of the Royal gardens had manipulation of the material. The resources of the Royal gardens had been drawn upon to the extent of four huge vanloads of plants, and it is a sufficient evidence of the richness with which they are stored to say that there still remained plants enough to have repeated the decorations.

St. James's Palace and the Chapel Royal in the early morning of and throughout Wednesday presented a most animated appearance. To the on-looker ignorant of the systematic manner in which the work was being carried out, there appeared to be bewildering masses of lofty Palms, huge Crotons, graceful Ferns, and brilliant flowering plants; but with astonish-

ing deftness and rapidity they were arranged in beautiful banks and groups, until when completed staircases, landings, windows, and columns were garnished with beautiful floral adornments. Passing through the state rooms the wedding assembly traversed the armour room, the windows of which were filled with plants. On the right as they descended the stairs was a magnificent group, and at every turn fresh banks of foliage and flowering plants were disposed. The pillars of the colonnade were wreathed with Roses and Ivy, the flowers being twined round the columns, and festoons of Roses and Ivy sprays stretching from the pillars, together with baskets of Roses, were suspended above the heads of the bridal party. A beautiful glade of Ferns dotted with flowering plants flanked another flight of stairs, at the top of which an admirable effect had been secured by placing a tall Palm at each side of a lofty picture. Near the entrance to the chapel was the retiring room of H.M. the Queen, who entered the Palace at this point. The surroundings were beautifully decorated, and a magnificent bouquet awaited the arrival of the Sovereign.

The most beautiful feature of the Chapel Royal was the great window, the stone facings of which, 18 feet high and 1 foot 10 inches broad, were completely draped in pink and white Roses. At each side was a tall Bamboo, arching over. The large recess at the base of the window was filled with cut flowers and tall glasses appropriately furnished, the whole forming a picture of wonderful beauty. On the wall under the window, and just above the altar table, was a floral emblem in Gothic lines, executed in white York Roses on a groundwork of green moss. The altar table was beautifully furnished with bouquets

and glasses of flowers.

It would be bewildering to attempt a description of every method that had been adopted to beautify the palace and chapel, or to enumerate all the plants and flowers utilised. The complete composition of all the groups would fill a page, and consequently only a brief reference need be made to the material employed. One very fine group was composed of some splendid Palms, Latania borbonica being conspicuous amongst them; noble Crotons, such as pictum, 8 feet high, nobilis, Disraeli, and Weismanni, Aralia Sieboldi variegata, grand plants of Anthurium Andreanum, Clethra arborea, Coleuses and Grevilleas, lightened with Hydrangea paniculata grandiflora, Liliums, the lovely "Bridal Wreath" (Francoa ramosa), and many other flowering plants. At the front a most unique effect had been secured by associating the very rare and lovely White Water Bean, Nelumbium speciosum nuciferum, with a groundwork of Cyperus and various aquatics. A charming group had been put together at the side of the grand staircase in St. James's Palace of various Crotons, Palms, Ferns, and Araucaria excelsa, with such popular flowering plants as Marguerites, Tydæas, Achimenes, Hydrangeas, Ericas, and Gloxinias. The windows were filled with Fuchsias, Marguerites, Pelargoniums, Hydrangeas, and other flowering plants associated with Caladiums and Ferns. Amongst the Palms utilised in the different groups were some splendid Arecas, Kentias 15 to 20 feet high, and Cocos plumosus quite 20 feet. Grand plants of Anthurium crystallinum and A. Warocqueana, also of Alocasia Thibautiana, were noticeable, while a beautiful basket of Orchids was greatly admired.

The cut flower decorations were a vast work in themselves. There was 476 feet of wreathing on the colonnade, this being composed, like the baskets, of white and red Roses. There was also 20 feet of wreathing in Roses on the altar, and Her Majesty's retiring room was decorated with Tea Roses and Gladiolus The Bride. Altogether upwards of 5000 Roses were utilised, with large quantities of white

fladioli, Stephanotis, Tuberoses, and Carnations.

The bouquets and floral decorations, made and carried out by Messrs. Wills & Segar, were quite worthy of the reputation of the firm. Fourteen Royal Princesses carried beautiful bouquets. That of the bride was an exquisite shower bouquet, in which the "old Provence Rose Duke of York?" was the flower most largely employed, and it was associated with Carnation The Bride, Odontoglossums, Cattleyas, Orange Blossom, and Lily of the Valley, interspeised with Myrtle, Fern, and other leafage. This and the ten bridesmaids' bouquets, which were composed of similar flowers shaded with Cattleya Mendeli, were exquisite examples of taste and skill. York Roses, white Carnations, and many choice Orchids were noticeable in the beautiful bouquets carried by H.R.H. the Princess of Wales and her daughters. Gardenias were the buttonhole flowers of the Prince of Wales and the Duke of York.

The floral decorations at Buckingham Palace were most extensive and beautiful, the experience of over twenty years there and at Marlborough House having well qualified Mr. Wills for producing something worthy of so auspicious an occasion. Large quantities of the most choice and beautiful plants and flowers were employed with a taste and judgment which rendered the mansion of the Sovereign a floral fairyland. The superb gold plate displayed at the Royal banquet and the Royal wedding breakfast was interspersed with choice Palms and other exotics by the South Kensington firm, while the setting apart of the spacious ballroom for a public breakfast room gave them another opportunity of showing their exceptional skill.

A word may be devoted in conclusion to the efforts of private residents and the proprietors of business establishments in the City and West End. Thousands of balconies and windows were adorned with flowering plants and Ferns, transforming sombre streets into pleasant promenades. For those not gaining admission to the Royal Palaces or Chapel, these public decorations proved most pleasing and attractive It would add to the pleasure of those whose special love for and work amongst flowers adds a powerful significance to what has been observed on this occasion if it could be thought that they would have

permanent influences for good. The old City has come out of itself, but reaction is inevitable, and it may be hoped that it will not be a complete return to the status quo. Flower-furnished windows are still the exception in our huge towns, and a great work must be accomplished before the masses are educated up to the sense of beauty and refinement which finds expression in bright and fragrant blossoms. They bring refreshment to the heart and contentment to the mind, giving new pleasures to those who, if past the first "lexicon of youth," are not so in the sense of being on the threshold of gardening life, but have the bright rubicon of manhood before them, opening up fresh fields of thought and happiness, even though the sands of their material existence be running down.

Something, too, may be hoped for from the love that those who have to-day, with every token of a nation's affection and esteem, entered upon a new and momentous epoch in their lives, are known to bear for flowers. At Sandringham, where the Royal honeymoon is to be spent, few of the flowers so admirably cultivated by Mr. McKellar are more extensively grown than Tea Roses, and for these chaste and delicious blossoms the bridegroom is reputed to have a special regard. But both he and his Consort, possessing in a rare degree the attributes to which

leaves below are simply blotched (a), and one leaf (b) is perfectly clean. The attack looks like frost-bite, or blackening by an overdose of an insecticide or fungicide. If one of the young leaves be examined on the under side a number of small dots will be seen. These appear concave and whitish, but they are really convex and yellow, with a minute black central spot or spots. The dots are just visible to the unaided eye, as shown at B—a small leaf, natural size, blackened and destroyed. There is nothing whatever on the upper surface of the leaf but dead hairs as outgrowths. Taking a still smaller leaf, and examining it by an ordinary pocket lens, I find the yellow pustules spread over the whole of the under side, and they still appear concave, not unlike the "cups" of an Æcidium, the whole tissue of the leaf (C) being destroyed down to the point c, that part being black; but below c the footstalk is perfectly healthy. One noticeable feature is, the dots or spots are not present on the footstalk nor on the midribs and veins of the leaf. This is a remarkable characteristic of mites—they never, or very rarely, produce galls from those parts. By mites, I mean those of the sub-family Phytoptidæ (four-legged Phytoptus).

If a minute portion of an undeveloped leaf be examined by a lens, we find the pustules are a beautiful transparent yellow colour, and

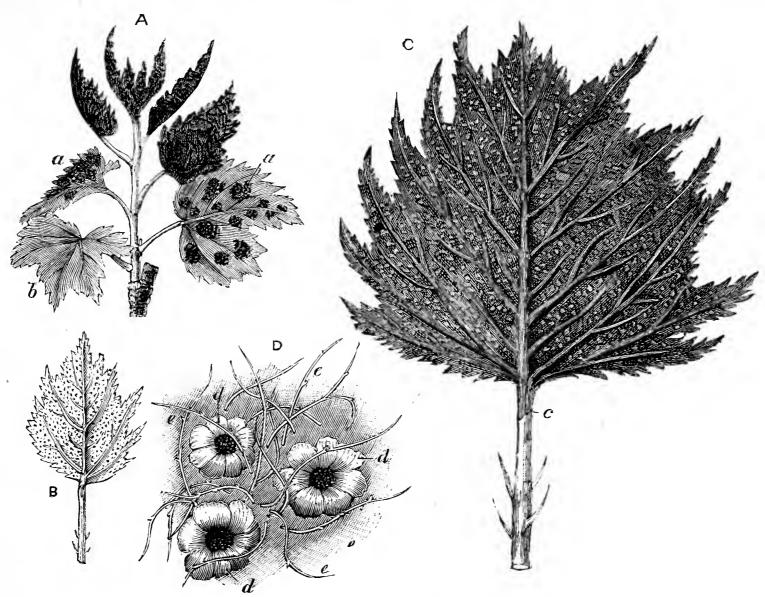

FIG. 2.—BLACK CURRANT SHOOTS DISEASED.

flowers specially appeal, are broad and catholic in their tastes, and the freedom with which they may be trusted to utilise flowers can hardly fail to popularise the garden and widen its influences for good. A great step will have been gained if the ever-widening eddies thus set in motion carry the germs of flower-love into new waters, bringing brightness and delight to those for whom at present the Roses bloom not.

BLACK CURRANT SHOOTS DISEASED.

A DISEASE has appeared in recent years on the tips of the shoots of Vines, Figs, Tomatoes, and other plants grown under glass. It first contracts the margin of the lcaves and causes them to enrol or enclose (in Vines it is the reverse—i.e., invert), and the affected growth becomes of a dirty dark brown or black, the leaves dying. The disease in Figs, Vines, and Tomatoes is certainly contagious, but there is no trace whatever of fungal attack, and though the appearance is that of red spider attacks with the leaf tissues blackened, there is no evidence of animal parasites. I am persuaded, however, that it is due to mites, which have the property of producing chemical changes, and that always takes the primordial colour of the host, as seen in the younggrowth before chlorophyll is formed.

But we are now concerned with the blackened condition of Black Currant shoots submitted by Mr. F. Q. Lane. The tips of the shoots are hardened in tissue, dirty brown or black, as shown at A, while the instead of being concave they are convex, and not unlike the fruits of Nectria ditissima (the Apple and Pear canker fungus) in form, or an Oak blister-gall, with a conspicuous black centre, composed of one or more irregular dots. Transparent yellow pustules may be discerned, and springing from the surface of the leaf (under side) between the blisters are some transparent white hairs. These are Erineum, and no creature can produce them but mites, nor any chemical known to science. Subjecting a still minuter portion of a young infested leaf to a higher power of the microscope we get to see that the blisters have been raised from the cells of the leaf and immediately around the black central dot or dots, which are raised with the blisters. Three are shown in D, at d, and the hairs, e, are seen to be forked, and that division is produced by budding, as represented by the little knobs along them, here and there

Now that before mentioned is all there is to see on the leaves and shoots. The black spots or dots in the centre of the transparent yellow blister are the oxidised excreta of the mite, and the blister is caused by the chemical ferment set up in the plant tissues or cells by the liquid portion or poison absorbed, and corresponds to those raised by ants on the human skin. The abnormal growth of the hairs is due to endeavour on the part of the plant to throw off the poison, and this only provides pasturage for the mites, for they browse on those, and when they defoliate the crop of Erineum the mites must do or die. I am aware that the mites are said to "stray about upon the leaves and the shoots, and make their peculiar gold-coloured galls [which are shown in D] upon the

young and tender twigs [we have seen with a certain result—death to the parts] as well as upon the sheathing scales or embryonic leaves of the buds, it is believed that they live upon these, if not upon the leaves also until the buds are again formed." This is partly true, for they cannot and do not live on the leaves and young shoots, nor are the yellow pustules in any sense galls, but mere blisters, poisoning and killing

the young leaves and young wood.

The Hazel-bud gall mite has already (May 30th) possession of the newly formed buds of the Hazel, the leaves corresponding to the buds having a large purple blotch in the centre of the leaf, and the Erineum is being produced abundantly by the scales, but there is not a mite to be seen (except in the buds galled), nor are the central or embryonic blossom or wood buds yet touched, but soon will be when the mites emerge, for their "buds" penetrate the leaf buds at the base of the scales, and they, dropping their poison on the growing parts, produce the gall, and Erineum hairs spring forth bounteously inside, upon which they live and pass the winter in safety, feasting and fattening, and reproducing on what would otherwise be the young shoots, and leaves, and puts of the suggesting year. It is the same with the Common that and nuts of the succeeding year. It is the same with the Currant-bud gall mite. The question, Where are the mites now? I am unable to find any on the shoots and leaves sent by Mr. Lane. I have shown what they have done, and it is questionable if they can or do enter the embryonic buds in any form than that completing the cycle of their existence.—G. ABBEY.

NOTES ON TOMATOES.

TOMATO SUTTON'S DESSERT.

THIS appears to be an excellent variety where large fruit are not In a Peach house at Rooksbury Park many plants of it are now growing, they all have set a wonderful crop of fruit. This is borne in long racemes, ranging from 1 foot to 2 feet long, and carrying as many as nineteen fruit on one raceme. The fruit is about the size of a large walnut, quite smooth in the skin, bright red in colour, and of excellent flavour, just the right kind to eat in a raw state.—E. M.

TOMATO DISEASE.

THE new disease to which Tomatoes are subject, so ably described by Mr. Abbey (page 471, June 15th), made its appearance at Ivy Lodge, Bridge of Allan, four years ago, the first year the late Mr. M'Tavish grew Tomatoes there. The water used is a natural supply, which enters the garden at the highest point from the grounds above, and is collected into a tank from which it is led by pipes to wherever wanted. Whether it is contaminated with sewage or any other deleterious matter from the houses on the higher ground I cannot say; but there is a contamina-tion somewhere, for the tank, cisterns in the houses, and a pond are continually covered with a green confervoid. Once, when talking with Mr. M'Tavish about the sudden collapse of his plants, he said Mr. Thomson of Clovenfords, who was calling a few days previous, attributed it to the attack of wireworm. As I could not observe any of the usual signs of a wireworm attack I misdoubted the statement without any farther evidence than the sudden dying of the plants; therefore several of them were examined, but neither wireworm nor

any appearance of their work could be found.

"J. F. D.," at page 505, says, "Seeds should be purchased from one of the best houses in the trade." Even although we do so it does not always turn out as we wish. I enclose several seeds which are discoloured. Is it the nidus of some species of disease? Fully a third of the seed from a healthy fruit had the same discolouration as those sent. If it is the seat of a form of disease it will account greatly for the spread of such diseases. Would any of your readers who may have grown "Sharpe's First Little Beauty" give their opinion of it?—G. M'DOUGALL,

We have examined the seeds and fail to find any spores of bacterium attached to them. The seeds, however, are not only discoloured, but very weak, and not likely to produce sturdy, healthy seedlings. Seed should be saved from the finest and best ripened fruit, selecting the largest and most plump clean seeds, rejecting those which are small discoloured, and manifestly not well developed.]

TOMATOES AT WEST HILL HOUSE.

THE description of successful Tomato growing is of interest to all those—and they are many—who, either commercially or for family use, are trying to make their crops as good as they can with whatever means they may have at command. A very successful system of culture is pursued by Mr. Hawtin, gardener to Mr. Samuel Herrick Sands, late Mayor of Nottingham, at West Hill House, on the Lenton side of the borough. He devotes one of his houses, through the summer season, entirely to Tomatoes. It is some 30 feet long, by 18 or 20 feet wide; span-roofed, and curvilinear, thus having plenty of light. In the centre, on the stone bench which covers a water cistern, he has them growing in 13 or 14-inch pots, well drained, but standing in pans to retain the waterings, and keep the plants always cool and moist at their roots. On the side benches he puts boxes made the whole length and width, 2 feet wide and 6 inches deep, holding say $4\frac{1}{2}$ or 5 inches of soil. In these boxes the plants are placed in a double row on the outer and inner sides; they stand about 18 inches apart, and grow straight up, fastened to stakes until they reach the wires of the roof, to which they are afterwards

From this it will be seen that the plants are rather close together, but being grown on the single-stem principle, and daily attended to, there

is no crowding. In all there are about eighty plants in the house, and Mr. Hawtin told me that since he commenced cutting he had cut some 150 lbs. of fruit, and when we saw them, June 26th, there would be about 50 lbs. of fruit quite ready. The majority of his plants are a sort selected by him, a few years ago, from a very fruitful plant out of a packet of seed of Hepper's Goliath, though, in most years, he adds a few plants of the other varieties which are said to be excellent by other growers. He has tried all the forms of Perfection, Conference, and others; but as he does not grow for show but for use, he finds none to fill his basket like his variety of Hepper's Goliath. Hepper's, though a corrugated fruit, and much like Sutton's Earliest of all in habit, fruit, and prolificacy, grows with him to an excellent size, and a very high colour. He is trying Sutton's Maincrop this year, and in some things it suits him, but does not give him such satisfactory results as his own variety does. The compost used is a mixture of half and half turf and decayed cow manure. This is found to hold out the longest, besides giving firmness and short-jointed growth to the plants. The plants are top-dressed every now and then through their fruiting stage with guano, and are occasionally watered with liquor from the garden tank, into which all the house sewage goes.

Mr. Hawtin uses the syringe very slightly, if at all, he believing that trying to grow Tomatoes on the lines of Cucumbers has been the cause very largely with those who do so of the dreaded Tomato disease. With him he has never had the least sign of it, and he attributes it partly to his non-use of the syringe, a soil not too rich nor in too great quantity, and good feeding by top-dressings of soil and guano, and occasional rich waterings, and his light and airy house. We agree with him, and his results show that he is right. There may be a point or two in these notes which will be of advantage to some Tomato grower or other, and every little helps.—P. H. N.

ABOUT HULL. -- III.

WELTON HOUSE.

Two friends from the north took a pair of northern appetites with them into a southern restaurant some time ago, and one whispered to the other to "give him a bit of broad Yorkshire" as the waiter approached to solicit their orders. No. 2, not being too hungry to appreciate a joke, complied, and the confusion of the waiter was as complete as though he had been asked to bring Solanum tuberosum or Brassica oleracea. No. 2, when on his native heath, is Mr. Charles Lawton, head gardener to Colonel Harrison Broadley, Welton House, near Brough, but he spared me a Yorkshire accent in the hearty Yorkshire welcome extended to me when I made my call. But there is shire welcome extended to me when I made my call. But there is breadth about Mr. Lawton apart from the speech in which it sometimes pleases him to indulge. He is broad in person to begin with, and broader still in mind, one of those gardeners who combine practical knowledge with scientific culture, keen intelligence, and a sturdy

independence of thought.

Welton House stands in beautiful grounds close to the far-famed Welton Dale, which is a part of the vast estate, and to which troop numbers of excursionists from Hull, for Colonel Broadley throws it open to them, and thousands are glad to avail themselves of the privilege. Bills are frequently on view in Hull town inviting would-be visitors to part with eighteen pence, and in return to be transported per waggonette to and from Welton. The vehicles are not, to speak frankly, models of luxury, but they are comfortable, so that anyone who feels inclined to go by road has a fair opportunity of gratifying his desires. If the rail is chosen I am doubtful whether Ferriby or Brough is the nearer station. independent of both waggonette and train it was not a special poin with me, but it would be a pleasant and not very long walk from either. Welton village and the surrounding country has an interest for lovers of the "good old times" in its connection with the exploits of Dick Turpin, Scarborough, Snowden Dunning (or Dunhill), and other notorious persons. Mr. Lawton pointed out an old hostelry there in which the lamented Richard was incarcerated pending his transmission to York under other conditions than prevailed on his famous ride. I was fortunate in seeing Welton under the favourable conditions of glorious summer weather, and the fine views from the head of the Dale were at

The gardens and grounds around the mansion possess the immense advantage of abundant leafage. Beeches and Elms flourish wonderfully well, particularly the Copper Beeches, which excel their brethren in vigour and luxuriance, and make a fine feature. One tree near the house has attained to enormous dimensions, and the branches, having spread across the drive, have been raised on a frame-work of stout poles, forming a natural arch of great beauty. An extraordinary instance of vitality in a tree is afforded by an enormous Sycamore, the branches having a spread 33 yards in diameter. At a height of about 5 feet the trunk split in a heavy wind, and one portion was dragged to the ground. It was resolved to raise it and bolt the two Failure was the universal prognostication, being voted as certain as that a ship must come to grief if an attempt were made to drive it by steam; but the ship went and the tree grew. A bolt was driven right through the pith, and a large plate was affixed. The plate is now covered with bark, the wounded parts healed, and the tree is in perfect health.

There is a great deal to interest old timers in the houses at Welton for hardwooded plants are well represented there. Some are "specimens" of quite an aldermanic corpulence. For instance, there is huge plant of Polygala grandis 4 to 5 feet through, and without exaggeration a very beautiful object; also a grand example of Statice profusa 5 feet across. Ericas are well represented by ventricosa globosa 4 feet in diameter, and Lindleyana, which is about half the size, and has been in bloom three months. Franciscea Lindeni, with its beautiful purplish mauve flowers, which are borne later than those of the other species, measures about 3 feet across, and being covered with flowers is something to admire. There are some bulky old Azaleas, such as Magnificent (about 6 feet across), Duc de Nassau, and Iveryana, not pyramids, but broad, evenly furnished specimens full of bloom. Boronia elatior is an object calculated to surprise the southron, who is not used to calculating the size of members of this genus in feet. Other noteworthy plants are Streptosolon Jamesoni wound round stakes in a large pot and freely bloomed; Cassia corymbosa, 4 to 5 feet across; Dasylirion gracile glaucescens and D. acrotrichum; magnificent specimens of Gleichenia Mendeli and G. speluncæ, the former about 8 feet through, the latter a couple of feet less; Lapageria alba on a balloon-shaped trellis 4 feet in diameter, which has been clothed in flowers; Euterpe edule, Stevensonia grandiflora, Dion cdule, Ixora Williamsi, I. Duffi, and Rondeletia speciosa. Eucharis amazonica is in splendid health. One large piece has not been repotted for eighteen years, and is rarely without flowers, blooming seven and eight times in a season. It is supported with liquid manure and soot water, and proves its vigour by bearing seven flowers on a spike.

The conservatory, which is about 60 feet long by 45 feet wide and 30 high, contains an assortment of material such as is not often met with. Some of its occupants are familiar enough, but others are less so. Amongst the former may be mentioned the Camellias, which are a wonderful feature; the Abutilons, which go right up to the roof; Cantua dependens, which has been full of bloom since January and is a lovely sight now; Fortune's Yellow Rose, which has been planted forty-seven years and eovers one end and part of the roof, bearing thousands of flowers; Lardizabala biternata, and a number of fine Palms and Tree Ferns. Draco Banksi erythrochysis is more of a stranger, at least to me, and there is plenty of it to study, for it is 30 feet high, and two other stately exotics on which I gazed for the first time were Dacrydium cupressinum and Alectryon excelsum. Feeling rather dubious about being able to give a description of them in the short space at command I take refuge in the useful generalisms that both are "handsome and effective," while the latter is found "useful for cutting." I think that if the names of the plants sound strange these phrases will make up for it. There are many other odds and ends of a more or less attractive character, and one is tempted to think that Colonel Harrison Broadley has either roved afar or had many wandering friends, so strangely is his conservatory stored. It is likely enough that it would not entirely satisfy the present generation, but it is interesting, and beautiful withal.

Peaches and Nectarines do wonderfully well at Welton. They are not far from the limestone, and appreciate it more than the wanderer whose way takes him over many a white and dusty highway, where Peaches grow not. We have had thirsty weather of late. The Lawtonian trees include specimens of the past as well as present generations, not dating quite back to the days of Turpin perhaps, but still venerable. There is a Grosse Mignonne of impressive rotundity, reputed to be fifty years old, which has not missed a crop, the present gardener told me, for twenty-four years, and has yielded as many as twenty dozen Peaches as one season's quota. In its younger days 10 and 11-oz. fruits were not uncommon; it does not reach that figure now, but bears crops quite good enough to insure its retention, and he would be callous indeed who could condemn such a faithful old slave without a sigh. Trees four years planted promise to follow the parental example, so vigorous, so healthy, and so fruitful are they. The Vines are equally satisfactory, and afford ample evidence that although Mr. Lawton has earned special repute as a plantsman, he is equally at home in other departments of the garden.

CONIFERS AT WEST ELLA.

A hint from the Welton gardener took me to West Ella, the residence of C. P. Sykes, Esq., where, he told me, there were some particularly fine Conifers. The place adjoins the village of Kirk Ella, which is one of the most beautiful it has been my pleasure to discover about Hull. There is quite a family party of Ellas in the neighbourhood, all having derived their name from a worthy savage of the pre-Normanic era. Doubtless he had a soul above Conifers and such like effeminate delights

of an effetc generation.

The gardener at West Ella, Mr. Sturdy, is an old junior of Mr. Lawton's. He was making his way down the village when I arrived on the scene, but executing a strategic movement I captured him near the village pump, which, by the way, is an elaborate and ingenious institution that would have astonished the primitive understanding of the ancient Saxon. West Ella is a very beautiful old house flanked by irregular sweeps of lawn, on one portion of which is a small lake dotted with Water Lilies, edged with yellow Irises, and looked down upon by heavy masses of Rhododendrons. The walls of the building are clothed in Roses and Honeysuckle, so that it presents a most pleasing aspect. There is plenty of good timber in the vicinity, and the Conifers, although not numerous, comprise some noteworthy specimens. Picea nobilis is represented by a fine tree about 50 feet high, and which has borne some splendid cones, and there is a P. Smithiana of equal proportions. An otherwise grand tree of Cedrus atlantica glauca, 40 feet high, has been broken about by the snow, and its beauty unfortunately marred. The best specimen of Wellingtonia gigantea is a noble example, and there are

also some fine Cedars, notably a Doodar, 50 fect high, and a spreading "Lebanon" with an altitude of about 60 feet. The Araucarias are also remarkably fine. Less imposing, but quite as perfect in its way, is the 4 feet specimen of Abics Parryana glauca, a very beautiful little lawn tree.

Space only permits of the briefcst possible reference to West Ella, and I can only add that throughout the establishment there is ample proof of Mr. Sturdy's capacity to do justice to a place that in itself and its surroundings can claim a special charm and attractiveness.—W. P. W.

OXYLOBIUM CALLISTACHYS.

This ornamental shrubby plant does not appear to be so generally well known as it might be, or it would be more extensively cultivated. Either as small plants for the side stages of the conservatory or as

FIG. 3.—OXYLOBIUM CALLISTACHYS.

plants 4 feet high in large pots it would be found very useful. Like most of the Australian plants Oxylobiums require only ordinary greenhouse treatment, but to make them flower freely allow them enough sun to thoroughly ripen their shoots. They will be found to thrive best in a compost of fibry loam and peat of about equal parts, with plenty of silver sand added. Oxylobium callistachys, shown in fig. 3, has bright yellow pea-shaped flowers produced in dense clusters, and is very showy, as are also many of the other species. The genus is a large one, but many of the species are not known in English gardens.

WASPS' NESTS AND CYANIDE OF POTASSIUM.

I NOTICE some remarks (page 518) re cyanide of potassium and the destruction of wasps' nests. Mr. Molyneux has had far better results from its use than I have had. I have used cyanide of potassium now for eleven seasons, and my experience of it is that it only kills the ingoing wasps. Where the nest is close to the entrance, which very often happens, it kills a portion only of those inside, whilst the rest are merely

held prisoners until the fumes of the cyanide have evaporated, when the wasps pass in and out as usual. I find also that it has not the slightest injurious effect on the larvæ or young wasps, which alone will soon form a very strong nest; but if a piece of turf be placed over the hole and pressed tightly in, it often prevents their escape.

I have used cyanide of potassium in different forms—in the solid about

the size of a small walnut, placed at the entrance to the nest; in its powder form as recommended by Mr. Molyneux, also dissolved in warm water, pouring it into the mouth of the nest. All these different methods of using it have produced precisely the same results, viz., that of killing all wasps passing over it almost instantly, and preventing those inside from escaping till its fumes have evaporated, which takes In the meantime it has no effect whatever upon the several days.

With due respect to Mr. Molyneux's suggestion, I should like to hear the experience of others on the effects of cyanide of potassium in the destruction of wasps' nests.—E. BROADY, Hooton Grange Gardens.

ROSE SHOWS. NATIONAL ROSE SOCIETY.

GREAT SHOW AT THE CRYSTAL PALACE, JULY 1ST.

Rose exhibiting as regulated by the fickleness of our English climate is a game of see-saw, the northern and southern exhibitors occupying each end of the plank, and rising gracefully up or coming heavily down according as the presiding genius throws its weight on the one balance or the other. The game is exciting to the participants, and diverting to lookers-on, the more so if among the fallen champions one is descried who had expressed roseate hues about his prospects long before the season commenced, only to have them dashed by some peculiarity of the weather later on. For three years past the southern growers have had the best of the play so far as the first "National" is concerned, for we have to go back to 1889 to find the great trade trophy out of Essex; but once more climatic conditions have given the northerners the advantage, and their southern rivals have been signally

A glance back over the records of the six years 1888-93, shows that on three occasions victory has rested with the young and energetic exhibitor, Mr. Frank Cant of Braiswick, Colchester, his successes being achieved in 1888, 1890, and 1892, which goes to show that he lays himself out for biennial victories. In 1891 Mr. B. R. Cant was triumphant, and in 1889, as this year, the coveted prize fell to Messrs. Harkness of Bedale. Rose growers in the South will well remember the character of the season in which the first success of the Yorkshire nurserymen was achieved. We had such a long spell of hot, dry weather, that southern Roses were hurried on with alarming rapidity, and when show time came they were distinctly past their best. Then came a trio of late seasons, in two of which Messrs. Harkness were unable to stage at all, and consequently the Essex growers came up smiling. But if the season of 1889 was early owing to the hot and dry weather, what are we to say of 1893? It has out-Heroded Herod, and everybody put it down as a foregone conclusion that the trophy must once more, like Hatteras, face the North. The Cants must have felt themselves beaten before a bloom was staged, but they bravely did their best, and may console themselves with the reflection that they showed much better than the majority of people expected.

With respect to the amateurs' trophy it is a different story. Sublimely indifferent to the character of the seasons Mr. Lindsell comes and conquers. He despises the climatic seesaw, and sails ever upwards. If it is a late season he wins; if it is an early one he "gets there" just the same. With a sequence of four consecutive victories to point to, success for him appears to have become an institution. His chief opponent of last year, Dr. Budd, did not institution. compete in the leading class, and throughout the Show there were some notable absentees. Where, for instance, was Mr those wonderful Teas of his, and where Mr. Burnside? Where, for instance, was Mr. Prince, with The latter was in evidence in the flesh, but in many classes where he is wont to show prominently he was not represented. Of the amateurs who exhibited more conspicuously than they have hitherto done may be mentioned

Mr. Machin, Mr. Drew, Mr. Orpen, and Mr. Foster Melliar.

And what of the Show as a whole? Truth compels the admission that it was the worst for several years past, a large number of the flowers being not only undersized, but coarse and soiled; still there were some brilliant exceptions, and the general opinion appeared to be that if below the average it was still a great deal better than might have been expected. The number of blooms appeared to be far less than at any preceding show of late years. A correspondent says there were 2000 fewer than in 1892.

NURSERYMEN'S CLASS.

As is well known the principal class in this section is for seventy-two distinct varieties, single trusses, and which usually brings forth a keen competition. As we have remarked, the fight between the northern and southern growers for the premier position, with which goes the challenge trophy, was not, however, quite so close as usual. Messrs. Harkness and Sons, Bedale, were declared the winners without much difficulty for a collection of fine blooms. The varieties were staged as follows:—First box, back row: Ulrich Brunner, Duchesse de Morny, Charles Lefebvre (fine), Suzanne Marie Rodocanachi, Duke of Fife, Gustave Piganeau, (good). Middle row: Madame Caroline Kuster Barthelemy Joubert,

Madame Bravy, Duc de Montpensier (fine), Cleopatra, Dr. Andry (splendid). Front row: Augusta Rigotard, Comtesse de Serenye, Comte de Raimbaud (good), Souvenir de Paul Neyron, Sir Rowland Hill, and Innocente Pirola. Second box, back row: Exposition de Brie, Lady Mary Fitzwilliam, Général Jacqueminot, Marquise de Castellane, Victor Hugo, Mrs. John Laing. Middle row: Margaret Dickson, A. K. Williams (grand), Princess Beatrice, Fisher Holmes, Boule d'Or, Horace Vernet (magnificent; the silver medal H.P. in this section). Front row: Madame C. Crapelet, Marguerite Boudet, Reynolds Hole, Etoile de Lyon, Harrison Weir, Madame E. Verdier. Third box, back row: Dupuy Jamain (fine), Madame G. Luizet, Gloire de Margottin, Ernest Metz (grand), Louis Van Houtte, Merveille de Lyon. Middle row: Marie Verdier. Charles Derwin (grand). Compage de Nadaillea Estador Verdier, Charles Darwin (grand), Comtesse de Nadaillac, Earl of Dufferin (splendid), Catherine Mermet, Madame V. Verdier (grand). Front row: Beauty of Waltham, Viscountess Folkestone, Mons. E. Y. Teas, Merrie England, Le Havre, Violette Bouyer. Fourth box, back Camille Bernardin, La France, Etienne Levet, Madame H. Jamain, Duc de Rohan (good), Baroness de Rothschild. Middle row: Souvenir d'Elise, Crown Prince, Francisca Kruger, Alfred Colomb (magnificent), Souvenir de S. A. Prince, Duchess of Bedford (good). Front row: Edward Andry, Mrs. Harkness, Prince Arthur, Jean Ducher, Duke of Wellington, and Countess of Oxford. Mr. B. R. Cant, Colchester, was second, the best flowers in this exhibit being Alfred Colomb, Ethel Brownlow, Jean Soupert, Prince Arthur, The Bride, and Maréchal Vaillant. Mr. F. Cant secured a third position with flowers good, but not up to the customary standard. Five exhibitors competed in this class.

In class 2, for forty-eight, distinct, three trusses of each, there was a very strong competition. Again, however, the northern growers secured the leading position, the first prize going to Messrs. Harkness & Sons. The blooms were very good, and comprised the following varieties:—Lady Mary Fitzwilliam, A. K. Williams (fine), Margaret Dickson, Barthelemy Joubert, Souvenir d'Elise, Mons. E. Y. Teas, Dr. Andry (good), Dupuy Jamain, Général Jacqueminot, Madame Bravy, Duke of Connaught, Comtesse de Nadaillac, Marie Verdier, Charles Lefebvre, Duchesse de Morny (fine), Reynolds Hole (splendid), Etoile de Lyon, Duchess of Bedford (grand), Marquise de Castellane, Alfred Colomb (good), Suzanne Marie Rodocanachi, Fisher Holmes, Caroline Kuster, Sir Rowland Hill, Gustave Piganeau, Mrs. J. Laing (good), Horace Vernet, La France (fine), Prince Arthur, Catherine Mermet, Dr. Sewell, Mrs. Harkness, Madame Verdier, Captain Christy, Exposition de Brie, Innocente Pirola, Duchesse de Vallombrosa, Ulrich Brunner, Madame G. Luizet, Senateur Vaisse, Madame Cusin, Countess of Rosebery, Merveille, Beauty of Waltham, Cleopatra, Merveille de Lyon, and Madame Willermoz. Mr. Frank Cant was a good second, the best flowers in this stand being Fisher Holmes, Marie Van Houtte, Xavier Olibo, Reynolds Hole, Souvenir d'Elise Vardon, and Ella Gordon. Mr. B. R. Cant followed with smaller flowers. There were four competitors in this class.

Mr. Henry Merryweather, Southwell, Notts, was awarded first prize in the class for forty-eight single trusses, again proving that northern growers have the season in their favour this year, the blooms being exceptionally fine. The varieties shown were Auguste Rigotard, Mrs. J. Laing, Général Jacqueminot, Jeannie Dickson, Marie Baumann, Baroness Rothschild, Charles Lefebvre, Duchess of Bedford (good), Madame Hauseman, John Stuart Mill, Madame Gabriel Luizet, Gustave Piganeau, Heinrich Schultheis, Sir Rowland Hill, Dupuy Jamain (fine), Victor Hugo, Gloire de Margottin, Souvenir de S. A. Prince, Comte de Raimbaud (good), La France de 1889, Horace Vernet (splendid), Marquise de Castellane, Camille Bernardin, Marie Margot, Ulrich Brunner, Her Majesty, Earl of Dufferin, Merveille de Lyon, Jeanne Sury (good), Spenser, Alfred Colomb, Suzanne Marie Rodocanachi, Beauty of Waltham, Duke of Teck, Senateur Vaisse, Prosper Laugier, Ernest Metz (fine), Dr. Sewell, Etienne Levet, Duke of Wellington, Brightness of Cheshunt, Catherine Mermet, Madame H. Pereire, The Bride, Fisher Holmes Francisque Rive, Abel Carrière, and Eclaire, Messers G. and Holmes, Francisque Rive, Abel Carrière, and Eclaire. Messrs. G. and W. H. Burch, Peterborough, were second in this class. These flowers were fresh, Horace Vernet, Camille Bernardin, A. K. Williams, Pierre Notting, and Charles Darwin being especially good. Messrs. Perkins and Son, Coventry, were third. Five competitors were forthcoming in this class.

Mr. W. H. Frettingham, Beeston, Notts, was first in the class for twenty-four, distinct, single trusses, staging some grand blooms. The varieties shown were—back row: Ulrich Brunner, Jean Lelièvre, Comtesse de Ludre (good), A. K. Williams (grand), Pride of Waltham, Alfred Colomb, Duchess of Bedford (richly coloured), Louis Van Houtte. Middle row: Duc de Wellington, Her Majesty, Auguste Neuman, La France, Charles Lefebvre (fine), Duke of Edinburgh, Marie Baumann, Lord Macaulay. Front row: Duke of Teck, Reynolds Hole, Madame C. Crapelet, Dinge Conard, Mrs. J. Laing, Ferdinand de Lesseps, Charles Darwin, and Mons. E. Y. Teas. Mr. J. Mattock, New Headington, Oxford, was a good second. This stand included some grand blooms of Marie Baumann, Mrs. J. Laing, La France, Ulrich Brunner, and Earl Dufferin. Messrs. D. Prior & Sons, Colchester, were third with fair Dufferin. Messrs. D. Prior & Sons, Colchester, blooms. There were four exhibitors in this class.

In the class for twenty-four, distinct, single trusses, the competition was keen. Messrs. G. & W. H. Burch were awarded the first prize for a stand of small, but fresh, and well coloured blooms. The varieties shown were Her Majesty, Reynolds Hole, Marie Verdier, Earl Dufferin, Mrs. J. Laing, Gustave Piganeau, Marie Van Houtte, Fisher Holmes, Madame Rady, Exposition de Brie, Merveille de Lyon, A. K. Williams, Xavier Olibo, Innocente Pirola, Marchioness of Dufferin, Duke of Wellington, Senateur Vaisse, Comte de Raimbaud, Alfred Colomb,

Comtesse de Nadaillac, Horace Vernet (good), Ulrich Brunner, Madame E. Verdier, and Marie Baumann. Mr. W. H. Frettingham, Beeston, was a very close second, showing, amongst others, grand blooms of Duchess of Bedford, Her Majesty, Comtesse de Ludre, and Merveille de Lyon. Mr. G. Mount, Canterbury, was third.

AMATEURS' CLASSES.

The trophy class for forty-eight blooms which always excites so much interest, brought five stands. It would be idle to state that they formed as high class a display as last year, but the season has always to be considered. A really fine stand from Mr. E. B. Lindsell, Bearton, Hitchin, secured the premier award and added to his already high reputation. The flowers were large, fresh, and full of colour, the varieties being as follows—Back row: Horace Vernet (very fine), Mrs. J. Laing, Prince Arthur (very fine), Madame E. Verdier, François Michelon, Ulrich Brunner (splendid, selected as the best amateur's H.P. in the Show), Her Majesty, Maurice Bernardin, Duchess of Morny, A. K. Williams, Mdme. J. Desbois (poor), Lady Sheffield, Louise Van Houtte, Merveille de Lyon, Countess of Oxford (out of colour), and Gustave Piganeau. Middle row: Mdme. Hoste, Duke of Wellington, Maréchal Niel, Dr. Sewell, Comtesse de Nadaillac (very good), Alfred Colomb, J. S. Mill, Ethel Brownlow, Prince Camille de Rohan, The Bride (fine), Dupuy Jamain, Caroline Kuster, Etienne Levet, Comte Raimbaud, Marie Van Houtte, and Abel Carrière. Front row: Fisher Holmes, Mdme. Cusin, Earl of Dufferin, Marie Verdier, Rosieriste Jacobs, Innocente Pirola, Madame V. Verdier, Chas. Lefebvre, Camille Bernardin, Xavier Olibo, Catherine Mermet, Sir Rowland Hill, Reynolds Hole, Souvenir d'un Ami, Beauty of Waltham, and La France. The Rev. J. H. Pemberton, Haveringatte-Bower, Romford, took the second prize. He had distinctly less weight than the Hitchin grower and one or two of his flowers were badly tarnished, but as a whole the stand was a good one. Marshall P. Wilder, Auguste Rigotard, J. S. Mill, Horace Vernet, Sir Rowland Hill, and Ernest Metz were extremely good, and the last named was a splendid flower. Mr. H. V. Machin, Gateford Hill, Worksop, was third with a highly creditable stand.

There were four stands of thirty-six single trusses, and the first prize went to the Rev. A. Foster-Melliar, Sproughton Rectory, Ipswich, for an excellent collection, the flowers being large and well coloured. The varieties were as follows—Back row: Mrs. Paul, Lord Macaulay, Comtesse Panisse, Madame Isaac Pereire, La Boule d'Or, E. Y. Teas, Baroness Rothschild, Emilie Hausburg, Duke of Wellington, Hippolyte Jamain, and Madame Hoste. Middle row: Marie Verdier, Le Havre, Victor Hugo, Maréchal Niel, Charles Darwin, Horace Vernet, Abel Carrière, Ethel Brownlow, Ernest Metz, Madame Charles Crapelet, Margaret Dickson, and Alfred Colomb. Front row: Camille Bernardin, Merveille de Lyon, Eugène Furst, François Michelon, Souvenir d'un Ami, Jean Liabaud, Souvenir d'Elise, Penelope Mayo, Comtesse de Nadaillac, Ulrich Brunner, Marie Baumann, and Beauty of Waltham. Mr. W. Drew, Uplands, Ledbury, took second place with an excellent stand; it contained no specially meritorious flowers, except perhaps a Général Jacqueminot, but the blooms were fresh and in good colour. The Rev. J. H. Pemberton was a good third. The twenty-four class only brought two stands, but both were good ones. Mr. Gurney Fowler, Woodford, had a very even, fresh, and richly coloured collection, and was placed first. His back row flowers were J. S. Mill, Rosieriste Jacobs, Duchess of Leeds, Charles Lefebvre (very good), François Michelon, Earl of Dufferin, Madame Eugène Verdier, and Prince Arthur. Middle row: Fisher Holmes (very fine), Xavier Olibo, François Louvat, Black Prince, Dr. Sewell, Mrs. J. Laing, A. K. Williams, and Victor Hugo. Front row: Le Havre, Princess of Wales, Madame Norman Neruda, Duchess of Caylus, Camille Bernardin, Comtesse de Paris, and Duke of Edinburgh. Colonel Pitt was second. Mr. Lindsell had the better of two stands of circum trebles his flowers being large and on the whole good, although sixteen trebles, his flowers being large and on the whole good, although one or two were very weak. The varieties were A. K. Williams, Horace Vernet (very fine), Her Majesty (poor), Lady Sheffield, Duke of Wellington, Louis Van Houtte, Catherine Mermet (bad), Dupuy Jamain, Reynolds Hole, Charles Lefebyre, Alfred Colomb, The Bride, Contagge do Nedeilles Fisher Helmes Printer And Louis Indiana. Comtesse de Nadaillac, Fisher Holmes, Prince Arthur, and Madame J. Laing. Mr. Machin was second. Mr. W. Drew won with twelve trebles from Colonel Pitt, his only opponent. The winner had Alfred Colomb, A. K. Williams, Général Jacqueminot, Mrs. J. Laing, Lady Sheffield, Charles Darwin, Comte Raimbaud, Marie Baumann, Louise Van Houtte, Horace Vernet, Ulrich Brunner, and Earl of Dufferin. Mr. Drew scored another victory with twelve of one variety, a fine stand of Mrs. J. Laing representing him. Mr. Budd was second with Marie Baumann, and Mr. Machin third with La France.

The five classes open only to growers of less than 2000 plants of varieties of exhibition Roses were interesting. The Rev. H. Berners, Harkstead Rectory, was first in the class for twenty-four distinct, single trusses. The varieties shown were Marguerite St. Amand, Marie Baumann (good), Her Majesty, A. K. Williams (rich), Baroness Rothschild, Camille Bernardin, François Michelon, Madame Marie Cointet, Earl of Pembroke, Dr. Hogg, Eclaire, Heinrich Schultheis, Le Havre (good), Duke of Edinburgh, Merveille de Lyon, Reynolds Hole, Gustave Piganeau, The Bride, Horace Vernet, Prince Arthur, Madame Hoste, Jean Soupert, Francisca Kruger, and John Bright. Mr. A. Slaughter, Steyning, Sussex, was second, the best flowers in this stand being Fisher Holmes. A. K. Williams, Dr. Andry and Boonts of Wolthers.

Holmes, A. K. Williams, Dr. Andry, and Beauty of Waltham. Mr. W. C. Romaine, The Priory, Old Windsor, was third.

Mr. A. Whitton, Asken, Bedale, was first in the class for eighteen distinct, single trusses, with a box of grand blooms. The varieties shown were Ulrich Brunner (good), Madame E. Verdier, Marie Baumann,

Merveille de Lyon, Duke of Wellington, Dupuy Jamain, Lady Mary Fitzwilliam, Thomas Mills, Viscountess Folkestone, La Havre, Mons. Gustave Guinneseau, Victor Hugo (good), Charles Lefebvre, Mrs. J. Laing (fine), Dr. Andry, Madame Gabriel Luizct, Countess of Rosebery, and Margaret Dickson. Mr. J. Parker, Oakfield, Hitchin, was second, and Mr. E. Mawley, Rosebank, Berkhampsted, third, both staging good flowers. Mr. J. Ough, Clifford Street, Hereford, was given the premier award for twelve distinct, single trusses, showing Sir Rowland Hill, Gustave Piganeau (good), Général Jacqueminot, Merveille de Lyon, Marie Baumann, Camille Bernardin, Her Majesty, Earl of Dufferin (good), Reynolds Hole, Mrs. J. Laing, Suzanne Marie Rodocanachi (grand), and The Bride. There was no other exhibitor in this class. The Rev. H. Berners was first with eight distinct, three trusses of each, showing fine blooms of Her Majesty, Henrich Schultheis, Ulrich of each, showing fine blooms of Her Majesty, Henrich Schultheis, Ulrich Brunner, Mrs. J. Laing, Merveille de Lyon, Camille Bernardin, Crown Prince, and Alfred Colomb. Mr. A. Slaughter was awarded the second prize, there being no third competitor. The Rev. H. Berners was again first for nine single trusses of any Hybrid Perpetual, showing a grand bloom of Merveille de Lyon. Mr. W. C. Romaine was second with Dr. Andry, and Mr. Whitton third with Merveille de Lyon.

Division E was open to growers of not more than 1000 plants. There were six stands of twelve, the best being that from Mr. Orpen, West Bergholt, Colchester, who had Alfred Colomb (very good), Maréchal Niel, Gustave Piganeau (very fine), Souvenir d'un Ami, Baroness Rothschild, Horace Vernet, La France, Camille Bernardin, Mdlle. Marie Rady, Marie Van Houtte, Fisher Holmes, and Marie Suzanne Rodocanachi. Mr. C. J. Grahame, Coombe Road, Croydon, was second, losing a little in weight, but gaining in freshness. Mr. Parker was third, and Dr. Tucker fourth. Mr. Conway Jones had the best of three stands of nine, his varieties being Prince Camille de Rohan, Catherine Mermet, Chas. Lefebvre, Niphetos, Louis Van Houtte, Marie Hoste, Benoit Comte, Alfred Colomb, and Earl Dufferin. Mr. M. Hodgson, Shirley Cottage, Croydon, was second; and Mr. C. E. Cuthell, Chapel Croft, Dorking, third. Mr. Parker had the best six trebles, his varieties being Alfred Colomb, Comtesse de Nadaillac, Mrs. J. Laing, E. Y. Teas, Earl Dufferin, and Suzanne Marie Rodocanachi. Miss Mellish and Dr. Tucker were second and third. The best six of one variety came from Dr. Tucker, who had very heavy blooms of Her Majesty. Mr. Parker was second with the same variety; and Mr. Hodgson third with Alfred Colomb.

There were two other stands.

The blooms in the classes open to growers of less than 500 plants of varieties of exhibition Roses were not quite up to the standard of last year. Mrs. L. P. Times, Hitchin, was first with nine distinct, single trusses, showing Her Majesty, Etienne Levet, Horace Vernet, Alfred Colomb, Earl Dufferin, Mrs. J. Laing, Marie Baumann, Madame C. Crapelet, and Duc de Wellington. Mr. G. Moules, Sim Street, Hitchin, was second, and Mr. H. P. Landen, Shenfield, Brentwood, third. Dr. Freshfield, The Wilderness, Reigate, was first for six distinct, single trusses, staging Duke of Teck, John Bright, Comtesse de Nadaillac, E. Y. Teas, Marguerite Brassac, and Star of Waltham in good condition. The Rev. J. R. Buchanan Horne Vicarage, Canterbury, was second in this class; Mr. F. S. Francis, Crofton Hall, Orpington, third; and Miss Denton, Orchard Court, Stevenage, fourth. Miss E. B. Denton was, however, first for four distinct, three trusses of each. These were Charles Lefebvre, Mrs. J. Laing, E. Y. Teas, Alfred Colomb. Mr. F. Francis was second, and Mr. A. F. Grace, Christy Green House, Steyning, Sussex, third.

In the class comprising six distinct, single trusses, and open only to marie Rady, and Comtesse de Nadaillac. Mr. A. F. Grace was second, and Mr. H. Browne, Spa Hill, Upper Norwood, third. Mr. J. Bateman, Highgate, first in the class for six single trusses grown within eight miles of Charing Cross, with Ulrich Brunner, Rosieriste Jacobs, Her Majesty, Marie Rady, Suzanne Marie Rodocanachi, and Camille Bernardin in good condition. Mr. Rivers H. Loughton, Hendon, was second, and Mr. Hugh White, 5, Woodside Cottage, Highgate, third. Rev. J. H. Pemberton, Havering-atte-Bower, Essex, first in the class for six "new Roses," single trusses. The varieties shown were Augustine Guinoisseau, Caroline Testout. Elise Fugier, Gustave Piganeau, Jeannie Guinoisseau, Caroline Testout, Elise Fugier, Gustave Piganeau, Jeannie Dickson, and Duchess of Fife. Mr. J. Bateman was a close second. There was no other competitor in this class.

TEA AND NOISETTE DIVISION.

In Class, 26, for twenty-four Teas and Noisettes, single trusses, there were three stands, and the winning one was that of Mr. B. R. Cant, whose flowers were even but by no means so clean and fresh as usual. He had a grand Ethel Brownlow, while Madame Hoste, Madame de Watteville, The Bride, and Souvenir d'Elise were also very good. Mr. Frank Cant was second with Ethel Brownlow, Niphetos, and Madame Cusin as the best of a moderate collection, and Messrs. D. and W. Croll were third. Mr. B. R. Cant again won with eighteen trebles, and this was a stronger stand than the twenty-four singles, the flowers as a whole being cleaner. Comtesse de Nadaillac, Madame Cusin, Madame de Watteville, and Ethel Brownlow were the best. Mr. Mount followed with much smaller but fairly fresh blooms, Marie Van Houtte, Comtesse de Nadaillac, Madame Cusin, and Niphetos being clean, though lacking size. Mr. Frank Cant was third. The Tea and Noisette trophy class for eighteen blooms brought out one of the very best stands in the Show. It came from the Rev. A. Foster-Melliar, Sproughton Rectory, Ipswich, and was distinguished for the size, freshness, and cleanliness of the flowers. The varieties were as follows:—Back row: Maréenal Niel Madame Cusin (a magnificent flower), Ernest Metz, The Bride, Comtesse Panisse, Ethel Brownlow (very fine). Middle row: Hon. Edith Gifford, Anne Ollivier, Innocente Pirola, Souvenir d'Elise (very fine), Jean Ducher (weak), and Souvenir de S. A. Prince. Front row: Catherine Mermet, Comtesse de Nadaillac, Caroline Kuster, and Marie Van Houtte (very good), Madame Hippolyte Jamain, and Souvenir d'un Ami. Mr. O. G. Orpen, Colchester, was second, and Mr. H. V. Machin third.

The Rev. H. Berners won with twelve, his blooms being very neat,

The Rev. H. Berners won with twelve, his blooms being very neat, clean and fresh. Ethel Brownlow was very richly coloured, and so was Madame Cusin. Colonel Pitt, Turkey Court, Maidstone, was second. Mr. Foster Melliar won with twelve trebles, his stand being of fair quality though the flowers were somewhat soiled. Mr. Machin was a close second. The best stand of any Tea or Noisette, nine blooms, came from Mr. Berners, who had a delightful stand of Madame Hoste, the flowers being in beautiful condition, though not large. Mr. Machin was

second with Caroline Kuster.

There were five stands of twelve in division 2, open only to growers of less than 500 plants of Teas and Noisettes, and the best was that of Mr. Orpen, the blooms being small but fairly fresh. Mr. Parker, The Croft, Headington, Oxon, was second with larger flowers, but some past their best. Mr. A. Tate, Downside, Leatherhead, was third, and Mr. Conway Jones, Hucclecote, Gloucester, fourth. The Rev. J. H. Pemberton won with nine, Mr. Mawley being second. Both had small blooms, but they were in excellent condition, the greater weight of the Essex blooms gaining them the chief award. Mr. Orpen was victorious with six trebles, having Marie Van Houtte particularly good, and Mr. Parker was second. They occupied the same positions for six of one variety, Maréchal Niel representing Mr. Orpen, and The Bride Mr. Parker. Dr. Tucker, Swanley Junction, was third with the Hon. Edith Gifford.

Division 3 was for still smaller growers, 200 being the maximum number of plants allowed. Dr. Tucker was victorious with nine singles, his flowers being very fresh and good, except Catherine Mermet, which was a decided blot on the stand. Miss Mellish, Woodstock Priory, Worksop, was second; and Mr. W. D. Freshfield, The Wilderness, Reigate, third. Mr. A. Whitton, Askew, Bedale, defeated four opponents with six, and he had a very good stand, Souvenir d'Elise and Rubens being admirable. Mr. J. S. Francis, Orpington, was a creditable second; the Rev. J. R. Buchanan, Canterbury, third; and Mr. G. Moules, Hitchin,

fourth.

The single variety classes were, as usual, very attractive. Mr. B. R. Cant had the best twelve of any yellow, winning with Madame Hoste; Messrs. Croll were second, and Mr. Mattoek third with Marie Van Houtte. There was one other stand, Messrs. Maek & Son won from four opponents with twelve of any white except Niphetos, Merveille de Lyon in good condition representing them. Messrs. Harkness and Croll were second and third with the same variety. Eight competed with twelve of any crimson except Marie Baumann or A. K. Williams. English Fruit and Rose Co. won with a grand box of Alfred Colomb. Mr. Mount was second with Fisher Holmes, and Messrs. Paul & Son third with Alfred Colomb. There were seven stands of dark velvety crimson varieties. Messrs. Prior & Son won with Fisher Holmes, Mr. Frank Cant was second with Xavier Olibo, and Mr. Mount third with Abel Carrière. Messrs. Prior & Son won from four opponents with Maréehal Niel, having a capital box. Mr. Mount was second, and Mr. Orpen third. Five competed with Marie Baumann, Mr. Mount winning with smooth bright examples. Messrs. Frank Cant and B. R. Cant were second and third. Mrs. John Laing was splendidly shown. Mr. Mattock won with a grand box. Messrs. Harkness & Son were second with smaller but beautiful flowers, and Messrs. Burch third. There were seven other boxes. Messrs. Mack & Son won with A. K. Williams; Messrs. Perkins and Son second, and Mr. B. R. Cant third, one other competing. There were only two stands of Niphetos, both very good. Messrs. Burch were first, and Mr. Mount second. Mr. B. R. Cant was victorious with Her Majesty, large but tarnished. Messrs. Burch being second, and Mr. Mount third. Two competed with Ernest Metz, Mr. B. R. Cant winning with a beautiful box, and Mr. Frank Cant being second. Mr. B. R. Cant was also first for Ethel Brownlow in splendid condition, Mr. Mount being second, and Mr. Frank Cant third. For twelve of any H.P. not named Mr. Frank Cant was first with Fisher Holmes, Mr. Mount second with the same variety, and Mr. B. R. Cant third with Alfred Colomb. There were eleven stands in all. Mr. Mount won with six of Catherine Mermet and six of The Bride, and Mr. B. R. Cant was second; no others competing. For twelve of any new Rose Messrs. Harkness & Son were first with a splendid box of Gustave Piganeau; Mr. Frank Cant was second, and Mr. B. R. Cant third with the same variety. Messrs. Dickson & Sons, Newtownards, had a beautiful silvery blush variety named Mrs. Sharman Crawford, for which a gold medal was awarded, and they were accorded a similar honour for a splendid ivory white variety named Marchioness of Londonderry. A gold medal also went to Mr. Chas. Turner for the garden Rose Crimson Rambler, which produces huge clusters of blooms. Messrs. Paul & Son, Cheshunt, won with twelve new Roses, exhibiting Gustave Piganeau, Mrs. Paul, Marie Magat, Dowager Duchess of Marlborough, Gustave Regis, Duke of Fife, Waban, Violet Queen, Chas. Gates, Paul's Early Blush, Bruce Findlay, and Frère Marie Pierre. Mr. Pemberton was second.

GARDEN AND BUTTONHOLE ROSES.

Messrs. Paul & Son showed garden Roses splendidly, as indeed they always do, and were placed first for thirty-six varieties. Gustave Regis, Madame Pierre Cochet, Rugosa, Camoens, Lucida, and Perle d'Or were

much admired. Messrs. Croll were second. Mr. Alfred Tate secured the first prize and Lord Penzance's silver cup for eighteen bunches. He had a splendid stand, but unfortunately it was overcrowded. Gloire de Rosomene, Gloire des Polyanthes, Queen of Bedders, Moschata nivea, and Perle d'Or were particularly beautiful. Mr. Pemberton and Mr. Machin were placed equal second, and Miss Mellish fourth. Mr. Cuthell won with twelve, Mr. Orpen following.

Mr. J. Mattock, New Headington, Oxford, first for twelve buttonhole

Roses. The varieties shown included Innocente Pirola, Comtesse de Nadaillac, Catherine Mermet, Marie Van Houtte, W. A. Richardson, Niphetos, W. A. Capucina, Madame de Watteville, L'Ideal, Souvenir de Paul Neyron, and The Bride. Messrs. Keynes, Williams, & Co., Salisbury, were second; and Mr. H. V. Machin third. Miss Mellish was first for

nine bunches of single-flowered Roscs.

THE PREMIER BLOOMS.

The premier H.P. in the trade classes, as already remarked, was a magnificent example of Horace Vernet in Messrs. Harkness & Sons' first prize stand of seventy-two, and in the amateurs' section a noble flower of Ulrich Brunner in Mr. Lindsell's first prize stand of forty-eight. The premier trade Tea was a beautiful bloom of The Bride, exhibited by Mr. B. R. Cant, and the premier amateurs' Tea a superb bloom of Madame Cusin, one of the best ever seen, in Mr. Foster-Melliar's first prize box of eighteen.

MISCELLANEOUS.

Miscellaneous exhibits were not so numerous as on former occasions. Messrs. W. Paul & Son, Waltham Cross, sent a large collection of cut Roses and ornamental foliage shrubs. The Roses were very bright, L'Ideal, Alfred Colomb, Mrs. J. Laing being specially good. Messrs. J. Cheal & Sons sent hardy flowers and Violas, and Messrs. J. Laing and Sons had a charming group of tuberous Begonias tastefully arranged. Mr. W. Rumsey, Waltham Cross, sent some Roses not for competition and Lord Penzance had a stand of garden Roses. Messrs. G. Jackman and Sons, Woking, also sent a large collection of cut Roses, which attracted some attention.

TORQUAY.—June 27th and 28th.

A Rose Show was held in the nursery grounds of Messrs. Curtis, Sanford & Co., Torquay, on July 27th, and continued the following day. The primary object of the Show was to provide a Devon Rosery Gardeners' Relief Fund. As in previous years, the whole of the arrangements were undertaken by the above firm, the members of which did everything in their power to render the Exhibition successful. About 400 feet of staging were erected in the house set apart for the Show.

Mr. Morton Sparke was awarded first prize for a box of twenty-four distinct varieties, which included an exceedingly fine Captain Christy and good specimens of Madame Willermoz and Lord Bacon. Mr. Sparke also obtained the gold medal for nine Tea and nine Hybrid Percetual The finest flowers comprised Madame Picrre Guillot, Etienne Levet, Hon. Edith Gifford, Baroness Rothschild, and Duke of Edinburgh. The honours again went to Mr. Morton Sparke for his thirty-six distinct varieties, including good examples of Ulrich Brunner, Xavier Olibo, Maréchal Niel and Anna Olivier. Mrs. J. M. Browning in her winning box of twelve distinct varieties sent admirable specimens of Baroness Rothschild and Merveille de Lyon. Mr. Fortescue was awarded the first for six distinct varieties, his most noteworthy blooms being Merveille de Lyon and Dupuy Jamain. Duchess of Bedford and Catherine Mermet were the pick of the half-dozen varieties with which Mr. J. Armitage secured honours, while in the class for six blooms of one variety Lady Macgregor won easily with a magnificent box of Maréchal Niels. Among the prizes offered by the Torquay Horticultural Society were two silver medals, one for the best Hybrid Perpetual and the other for the best Tea Rose in the Show. Both the medals were carried off by Mr. Malloek, Louis Van Houtte being adjudged the finest Hybrid Perpetual and his Alba Rosea the best Tea bloom.

The most striking feature of the Show was the splendid collection of cut Rose blooms exhibited by Messrs. Curtis, Sanford & Co., between thirty and forty boxes of the choicest varieties being staged with

admirable effect.

Messrs. Robert Veitch & Son of Exeter sent an interesting collection of Alpine plants.

SITTINGBOURNE.—JUNE 29TH.

THE Sittingbourne and District Rose Society is a new body, and as the Committee includes such well-known rosarians as Mr. R. L. Knight and Captain Christy, with Mr. Prideaux Selby as Secretary, its career should be as successful as enthusiasm and practical knowledge can make it. The first Show was an excellent one considering the trials brought about by the peculiar season, heavy wind and rain having followed the prolonged drought, and it may be expected to increase in importance as each year comes round. An admirable schedule had been formed, and the awards are briefly noted herewith.

In the first of the open classes, which was for thirty-six varieties, Mr. Geo. Mount won with a first-rate stand, the blooms being large, fresh, and bright. Gustave Piganeau, Duchess of Bedford, Mrs. John Laing, Niphetos, and Alfred Colomb were fine blooms. Messrs. W. Ray and Co. were second. Mr. Mount had another fine box of twelve trebles, the flowers being heavy, and except for one or two in beautiful condition. Messrs. Ray & Co. were second, and, as before, many points in the rear. With twelve Teas Mr. Mount scored his third victory, and again richly deserved it, for his blooms were in beautiful order. Ethel Brownlow, Madame Cusin, Souvenir de Paul Neyron, Comtesse de

Nadaillac, The Bride, and Souvenir d'Elise were all delightful examples. Colonel Pitt followed with much smaller flowers, of which Marie Van Houtte and Souvenir de G. Drevet were the best.

The classes reserved for members of the Society followed the rules of the National Rose Society, being divided into sections to suit small and large growers. Colonel Pitt won with twenty-four in the class for growers of any number of plants. His stand was uneven, and some of the blooms were weatherworn, but John S. Mill and Alfred Colomb were excellent, while Madame Bravy, Marie Van Houtte, and Camille Bernardin were very good. Major Knight was second, not far in the rear, for though there was less weight in his stand, the flowers as a whole were a little fresher. Captain Christy won with twelve. He had very fresh bright blooms, amongst which Marie Van Houtte, Mrs. John Laing, The Bride, and Dr. Andry were very fine. Colonel Pitt was second, and Major Knight third. Colonel Pitt was first with twelve Teas and also with six trebles, both being very good stands. In the latter class Major Knight was second.

Mr. Frank Honeyball was first with twelve in the section open to growers of not more than 500 plants, Mr. Edward Prentis second, and the Rev. W. J. Mellor third. With nine Teas and four trebles (Teas) respectively Dr. Selby secured the leading position, the other prizes going to Messrs. Mellor and A. J. Thomas. Mr. F. T. Knight had a bright stand of nine in the 250 plants section, and won somewhat easily from Mrs. Tylden, Mrs. F. Neame being third. Mr. Knight also won with three trebles, Mr. Mellor being second, and Mr. Neame third. Mr. Mellor had a very good stand of six Teas, the blooms including a fine one of President, and he won easily, Mrs. Tylden being second. Miss Vallance and Miss Walter secured the principal prizes in the remaining classes. The National Rose Society's medal for the best bloom in the Show was awarded to Major Knight for a grand example of Madame Victor Verdier.

The floral decorations were very attractive. Miss Ray was victorious with an epergne, in the arrangement of which she had displayed a commendable lightness of touch. Miss Knight was second, and Mrs. Selby third. Miss Ray won with a soup plate and tumbler of flowers, Mrs. R. L. Knight with a spray, and Miss Christy with buttonboles, Miss Vallance, Mrs. Selby, and Miss Sutton making themselves responsible for the minor awards. Mr. Kennett, gardener to the Rev. W. J. Mellor, exhibited a promising seedling Tomato.

CROYDON.—JULY 5TH.

THE best Show that the Croydon Horticultural Society has yet held took place in private grounds close to the east station yesterday (Wednesday). Roses, specimen plants, and vegetables were admirable, and it is only to be regretted that time and space do not admit of full particulars being given. Mr. Roffey had, as usual, arranged matters well.

The Rose classes were not well filled in all cases, but the flowers were surprisingly good. Messrs. Paul & Son of Cheshunt were not opposed with forty-eight, but they would have taken a great deal of beating, for their flowers were very clean and fresh. One of the best blooms was the rosy crimson H.P. Duc d'Orleans, while Niphetos, Viscountess Folkestone, and E. Y. Teas were excellent. Mr. B. R. Cant was unopposed with twenty-four trebles, and as usual in such classes had a strong Victor Hugo, Prince Arthur, and A. K. Williams were very fine, particularly the latter. Mr. Mount was victorious with twenty-four singles, showing an even and fresh stand in which Thomas Mills, Alfred Colomb, and A. K. Williams were very good. Mr. T. Durrant Young was second, and Mr. Butcher third. Mr. B. R. Cant had a splendid stand of twenty-four Teas, albeit a few of the blooms were a little tinged. Souvenir d'Elise, Niphetos, Luciole, and Catherine Mermet were all fine flowers, while there were many other good blooms. Mr. Mount was a very good second, and Messrs. Prior & Son third. Mr. Mount had the best twelve of one variety, a splendid box of Mrs. John Laing. Messrs. Prior & Son were second with Fisher Holmes, very even and well coloured; and Messrs. Paul & Son third with Mrs. John Laing. In the corresponding Tea class Messrs. Prior & Son were first with a beautiful stand of Maréchal Niel; Mr. Mount second with Comtesse de Nadaillac; and Mr. B. R. Cant third with Ethel Brownlow.

The fact of Mr. Lindsell showing in the amateurs' section was evidence enough of quality there. He won with thirty-six with a very good stand, in which a grand Horace Vernet was very conspicuous. Mr. Brown, gardener to Mrs. Waterlow, was second, and Mr. Alfred Slaughter third. Mr. Blundell, gardener to G. Christy, Esq., defeated the Hitchin amateur with twenty-four, but not by much, both stands containing flowers in good colour. Mr. Slaughter was third. Mr. Lindsell had a very fine box of six trebles, Horace Vernet and Alfred Colomb being excellent. Messrs. Blundell and Slaughter were second and third. Mr. Lindsell had the best twelve of one variety, small, but very neat flowers of Comtesse de Nadaillac representing him. Mr. Slaughter was second with Alfred Colomb, and Mr. Wright third with Mrs. John Laing. Mr. Blundell won with eighteen Teas, and Mr. Mawley with twelve, the latter also taking first for twelve H.P.'s. He had small but very clean flowers. Mr. Slaughter won with four trebles, and other prizewinners were Messrs. C. J. Grahame, Bateman (the latter being first for nine), G. Moules, K. H. Gifford, J. de la Marc, H. Shoesmith, and the Rev. W. Wilks. Mr. Grahame showed to great advantage in the district classes, and secured two medals with a beautiful example of Mrs. John Laing. The floral decorations, cut flowers, and table plants formed a good display.

The larger tent was filled with splendid material in the way of

specimen plants and Orchids. Mr. H. C. Tilbey, gardener to F. Berns, Esq., won with six of the latter. Mr. Carr, gardener to Mrs. Stephenson

Clarke, had some very fine Selaginellas, and won from Messrs. King, gardener to P. Crowley, Esq., and Simmonds, gardener to H. C. Mayhew, Esq. The latter won with Zonal Pelagoniums, and Mr. Slater, gardener to Mrs. Hulse with Gloxinias, Mr. C. Perrett also taking a first for the latter. Mr. Slater was most successful with Ivy-leaved Pclagoniums, and Mr. Tilbey with Ferns. Begonias were finely shown by Mr. Slater, the plants being large and well bloomed, while Mr. Kirk and Mr. Simmonds also had good plants, Mr. Slater and Mr. Kirk took the chief prizes. The famous specimens of W. Warren, Esq., Handcross Park, Crawley, now under the charge of Mr. W. Hallam (Mr. Offer, with whose name they have long been associated, having, we hear, been promoted) were very conspicuous in the classes for those plants. Mr. Hallam was first with nine and Mr. Carr second. The latter had much the larger plants, and would no doubt have won but for the backward state of his Rondeletia. Mr. King was third. Mr. Hallam had some magnificent ornamental leaved plants and won easily with nine, his Crotons, Alocasia maerorhiza variegata, and Cycas revoluta being pietures of health. Mr. King's giants were also in good order, his Anthuriums being very noticeable. He was placed second. Messrs. Hallam first for three plants, and King had another tussle for Ferns, the Sussex exhibitor emerging victorious, his plants were in splendid order. Mr. Simmonds was successful with both Carlot Sussex and Sussex exhibitor emerging victorious, his plants were in splendid order. ful with both Caladiums and Coleuses, and Mr. Carr with Dracænas. First prizes for groups went to Messrs. Scott, Wooldridge, and King. Messrs. B. S. Williams & Sons, Messrs. Laing & Son, Mr. J. R. Box, Mr. Butcher, Messrs. J. Cheal & Son, and Messrs. Pecd & Son had

characteristic miscellaneous exhibits.

An idea in connection with this Show well worth copying is to collect surplus Roses, and sell them in a tent on the ground on behalf of the Royal Gardeners' Orphan Fund. Last year £12 was secured in this way. Mrs. Gunner and Mrs. Dart presided over the stalls.

LEE, BLACKHEATH, AND LEWISHAM .- JULY 5TH AND 6TH.

THE Shows of this Society during the quarter of a century of its existence have always been of a high class character, and that held on the above dates was, notwithstanding the season, no exception to the rule. As usual the Exhibition was held in the grounds of The Cedars, Belmont Hill, Lee, by permission of Mrs. Penn, and the exhibits staged were quite up to the usual standard. Speeimen flowering and ornamental foliage plants formed a feature at this Show, and groups were well represented, the same remark applying to fruit and vegetables.

represented, the same remark applying to fruit and vegetables.

Specimen plants were shown in first-rate condition. Mr. J. Lambert, gardener to H. W. Segelcke, Esq., Herne Hill, was first for six foliage plants; Mr. Jeffery, gardener to Mrs. Crundell, Eltham, being second. Mr. C. Nunn, gardener to B. Soames, Esq., Maze Hill, Greenwich, carried off the honours for four foliage plants; Mr. Aley, gardener to R. Kersey, Esq., High Road, Lee, following. Half a dozen Caladiums were best shown by Mr. W. Payne, gardener to C. D. Abel, Esq., Blackheath; Mr. Fox, The Cedars, Lee; and Mr. C. Nunn following as their names are given. Mr. Lambert gained the premier award for four exotic Ferns, showing grand plants, Mr. Fox being second with smaller specimens. Mr. Jeffery had a good half dozen Ferns, for which the specimens. Mr. Jeffery had a good half dozen Ferns, for which the leading prize was awarded, the second place being accorded to Mr. C. Nunn. Mr. Fox was first for six Palms, and Mr. C. Nunn had the best six stove or greenhouse plants in flower. These included two fine specimens of Allamanda nobilis and A. Hendersoni. Mr. W. Jeffery was second with six flowering plants, showing smaller specimens. Mr. Nunn had the best single specimen plant in flower, Stephanotis floribunda, Mr. J. Pearee being second with Allamanda Hendersoni. Messrs. W. Jeffery and C. Nunn divided the awards for twelve stove and greenhouse plants. Mr. J. Lambert was first with six Dracænas, Mr. Jefferys and Mr. Fox following.

The class for a collection of twenty-four plants brought forth a good apetition. The prizes, however, went to Messrs. W. Jeffery, F. Fox, competition. and C. Saville in order named. Mr. Nunn was placed first for a group of plants, Mr. J. Pearce being second. Mr. C. Helmer, gardener to Miss Hooker, Lee Terrace, was first with twelve Gloxinias, and Mr. C. Nunn first for six plants. Mr. H. Horton also gained a prize for Gloxinias. Tuberous Begonias were best shown by Mr. T. Bell, gardener to Rev. G. T. Oldham, Blackheath; Mr. J. Lambert, and Mr. C. Helmer. Ornamental-leaved Begonias were good, the best plants coming from Messrs. J. Lambert, T. Aley, and G. T. Shrubb. A table of plants staged by Mr. W. Jeffery secured this exhibitor the leading award, the second prize being accorded Mr. F. Fox for a tasteful arrangement. Coleuses, Fuchsias, and Pelargoniums, table plants and hardy flowers, were also well shown by some of the above mentioned and other exhibitors.

Roses were shown in very good condition considering the season. Mr. B. R. Cant, Colchester, was awarded the premier prize for seventytwo blooms. The best of these were A. K. Williams, Beauty of Waltham, Victor Hugo, Marie Verdier, Madamei G. Luizet, Ulrich Brunner, and Alfred Colomb. Messrs. G. & W. H. Burch, Peterborough, were second with smaller flowers. There was no third competitor in this class. Messrs. Burch were, however, placed first with forty-eight Roses, showing good flowers. The second prize went to Messrs. J. Laing & Sons. Mr. J. Batcman, Highgate, had the best dozen blooms; Mr. H. Cole, gardener to T. A. Mitchell, Esq., Chislehurst, following. The same exhibitors secured awards for six Roses in the order given. Messrs. Burch gained the leading award for twenty-four blooms, Messis. B. R. Cant and J. Laing & Sons following.

Fruit was well shown. Mr. J. Neighbour, Bexley Park, was first for a collection of fruit, Mr. T. A. Kester, Plumstead, being second, and

Mr. Jeffrey, Eltham, third. Mr. Neighbour was again first for another collection of fruit, Mr. G. F. Shrubb, Blackheath, following. Grapes were best shown by Mr. J. Rhoden, Blackheath Park, gardener to J. Vavasseur, Esq., Mr. Neighbour being second, and Mr. Goddard, gardener to T. W. White, Esq., Eltham Road, third. The last named exhibitor was first with a single bunch of white Grapes, and Mr. Rhoden similarly for three bunches, showing Duke of Buccleuch in good condition. Mr. Shrubb was first with Strawberries, and Mr. Neighbour with Melons and Peaches. Other successful fruit exhibitors were Messrs. J. Pearce and W. H. Struckett.

Vegetables were shown in first-rate condition by Mr. Fox, who was first for a collection; Mr. Jeffery being second. The last-named exhibitor secured the leading award offered by Messrs. Sutton & Sons for vegetables from their seeds, the others going to Messrs. Neighbour and C. Nunn. Mr. Fox had the best six Tomatoes in pots. Mr. Turpin, High Road, Lee, gained the first prize given by Messrs. C. Sharpe & Co., Sleaford. In other classes vegetables were also well represented, special prizes being offered by Messrs. Daniel Bros., Norwich, and Carter, Page, & Co., London Wall.

Amongst the miscellaneous exhibits Mr. H. J. Jones, Ryecroft Nursery, Lewisham, secured a silver medal for a grand group of Fancy Pelargoniums tastefully arranged. Some splendidly bloomed Zonals staged by Mr. Jones also attracted attention, especially the new variety, Mrs. W. Wright. This is of a robust constitution, and the nearest approach to blue we have seen, meriting the first-class certificate It will unquestionably become a popular variety. Laing & Sons, Forest Hill, sent some Tuberous Begonias, well flowered; and Messrs. J. Peed & Sons, Roupell Park Nurseries, Norwood Road, S.E., had a group of Caladiums and other foliage plants, also a collection of Gloxinias. Messrs. W. Butcher & Sons, Blackheath, had a stand of weed killers; and Mr. W. Colchester, Ipswich, a stand of ichthemic guano.

EMIGRATION.—The July circulars of the Emigrants' Information Office, 31, Broadway, Westminster, and the penny and other hand-books, with maps, show the present prospects of emigration. A short pamphlet on Newfoundland is also issued. A new branch office has been opened at the Public Library, Nottingham. Work in New South Wales, especially in towns, continues to be very scarce. The best openings are for men who are experienced in fruit growing, in the drying and packing of fruits for export, in the management of irrigated and unirrigated orchards, in wine making, and in the manufacture and packing of butter and cheese. Domestic servants continue to be in steady demand throughout the colony. The towns of Victoria, and especially Melbourne, are full of men seeking work, and no working man should go there at present. With the object of providing employment, and drawing men away from the overcrowded towns, the Government have thrown open more land for settlement, and have taken steps to initiate village settlements, to construct two or three country railways, and to assist the formation of labour colonies. In Queensland the depression at Brisbane, Ipswich, Townsville, and other places still continues. New Zealand is in a prosperous condition, and offers many advantages to settlers. In Natal there is no special demand for labour. New land regulations have been issued under which cultivation is no longer made a condition of occupation by purchasers of crown lands. Agricultural farmers and their families are now given assisted passages to the Colony on certain conditions. Official information has been received that an agent has been sent from Brazil to induce British emigrants to go to the State of San Paulo in that country. In view of the suffering and loss of life which have been occasioned by previous schemes of this nature, all persons are again most strongly warned not to go to this or any other part of Brazil.

FRUIT FORCING.

Vines .- Early Houses .- When the Grapes are cut thoroughly cleanse the Vines from dust and insects by forcible syringings, keeping the house as cool as possible by free ventilation, and withdraw the roof lights where practicable when steady rains prevail. Vines that are becoming exhausted through long subjection to early forcing and bearing heavy crops should have one of the borders renovated where there are two, and the roots laid in fresh material near the surface. they are confined to inside borders the roots may also be lifted. Preparation should now be made for this operation by getting the materials together, so that the work may be executed at the right time and with dispatch. One of the borders only should be acted upon at a time, say the inside border one year, following on with the outside border the next. The proper time to attend to the roots in the case of early Vines is as soon as the foliage gives indications of ripening. Shade should be provided during the operations and the Vines syringed, keeping rather close for a time, or until they have pushed fresh roots, when free ventilation is necessary.

Houses of Ripe Grapes.—Give constant ventilation, and on hot days sprinkle water on the borders and floors to prevent the Grapes shrivelling. A temperature of 55° to 60° will be sufficient for Black Ham-

burghs by artificial means, but Muscat of Alexandria and other heatrequiring varieties will need fire heat to prevent the temperature falling below 60° to 65° at night. Muscat of Alexandria Grapes colour in proportion to the light and air they receive. Black Hamburghs finish best beneath a good spread of foliage, and a slight shade is absolutely essential to their keeping colour for any length of time after ripening. Some doubled herring nets drawn over the roof lights is mostly sufficient.

Grapes Stoning.—During this process the Vines should not be hurried, either by artificial heat or early closing. Supply the Vines with plenty of food in an available form at the commencement of the stoning, which is soon after the Grapes are set, and continue this up to their changing colour. There is nothing better for Vines than phosphatic and potassic manures, with nitrogenic in proportion to the vigour of the Vines. If they are heavily cropped and the foliage is relatively small they will require more nitrogen than where the foliage is ample. Nitrate of soda may in such cases be given with advantage, especially where the soil is light or calcareous. Root growth should precede or be simultaneous with leaf growth, and the growth produced must be stable, therefore the manure ought to contain other elements besides nitrogen. A good mixture for weak Vines in light and calcareous soils may be formed of three parts bone superphosphate, two parts carbonate of potash (pearlash), two parts nitrate of soda (powdered), and three parts ground gypsum; mix and apply quarter of a pound per square yard after watering, and wash in moderately. Sulphate of ammonia may be used where the soil is rather strong instead of the nitrate of soda. a good all-round manure for Vines there is everything they require in three parts bone superphosphate, two parts powdered saltpetre, and one part ground gypsum mixed, supplying a quarter of a pound per square yard at intervals, say when the Grapes are set or thinned, half swelled, and commencing to colour. If the roots are near the surface half the quantity only should be given at a time, but at less distant intervals.

Grapes Scalding.—The best preventive for this consists in admitting air rather freely towards the close of the stoning period, especially in the early part of the day and through the day, with a little at night, and a gentle warmth in the pipes, so as to maintain a temperature of about 70° artificially. Scalding is most prevalent during bright weather following a dull period. The essential point is to avoid the deposition of moisture upon the berries, for if they are allowed to be covered with moisture and the sun raises the temperature considerably before ventilation is given the leaves will assuredly scorch and the berries scald. The most critical time is just before (a fortnight to three weeks) the Grapes change colour for ripening. Muscat of Alexandria, however, scorches badly even after the Grapes are advanced in colour, and a slight shade, as that of garden nets drawn over the roof lights, is of great benefit in

breaking the fierce rays of the sun.

Shanking.—This is seldom altogether absent from the best cultivated Grapes, and often causes great trouble through deterioration of crop. It is known to be accelerated by suspended root-action at the critical period of the Grapes ripening, and certainly is a result of error in management, border formation, and soil constituents. No one really knows anything for certain about this tantalising disease, but it has been attributed to fungal and bacterial agencies. There are, however, no fungous outgrowths to be found in shanked Grapes, except those usually found on dead vegetable matter, but there is an affection on the shanks of the berries and footstalks of the bunches of Muscat of Alexandria Grapes that contain mycelia in the living tissue, and the outgrowths, though not well developed, are evidently those of a Gleosporium, not unlike G. laticolor. This is a rather unusual ailment in Muscat of Alexandria Grapes, and may or may not be associated with ordinary shanking (a contraction instead of swelling) in the footstalks of the berries.

To avoid shanking the borders must be well made and the Vines properly managed, fully exposing the foliage to light and air, allowing no more growth to be made than can have those essentials. Deficiency of ventilation in the early stages of growth, combined with too much moisture, inducing long-jointed growth and thin foliage, are unfavourable to the building up of healthy tissues, and food derived from a cold wet border, with the roots deeply situated, are not likely to produce well finished fruit. Vines liable to have shanked berries should be given time, particular attention being paid to the ventilation, and avoiding and an electron of the particular attention of the particular atten sudden fluctuations of temperature, so as to secure a steady supply of nutriment, and allow for its due assimilation by permitting a good spread of, foliage. Regulate the growths on the extension rather the restrictive system where there is room for it without crowding, keeping all gross laterals stopped so as to cause an equal flow and distribution of the sap throughout the Vines, and this will assist them to perfect their crops. It is, however, necessary to renovate the border in bad cases of shanking, and lay the roots in fresh compost near the surface.

Young Vines.-There are two methods of treating those of this season's planting. 1, Allowing them to grow unchecked so as to secure plenty of roots and stout stems, little regard being paid to the growths except as regards the leaves corresponding to the pruning buds, which are not suffered to be crowded, and this gives three good buds at the bottom of the trellis to which the canes are shortened at the winter pruning. 2, The young canes are permitted to grow to a length of about 9 feet, and are then stopped. The lateral at the joint will push strongly, and should be let grow to the extent of four to six leaves, when its point may be pinched off; then its laterals may be pinched to one leaf, also sub-laterals as made. Laterals proceeding from the joints along the cane being stopped to one leaf, and the sub-laterals also to one joint of growth, the vigour will be concentrated on the cane and principal buds without starting the latter into growth, and they may be pruned

so as to bear a moderate crop of fruit the following year.

Vines in Pots for Early Forcing.—Those intended for this purpose should by this time have completed their growths. Supply water only to prevent the foliage becoming limp, exposing the Vines to all the light and sun possible, so as to thoroughly ripen the wood and the buds. Keep them free from insects, as it is important that the leaves perform their functions to the last. After the wood becomes brown and hard the Vines may be stood on slates or boards in front of a wall with a south aspect, securing the canes to the wall to prevent the foliage being damaged by wind.

Melons.—Plants Swelling their Crops.—Ventilate early, or at 75°, keep through the day at 80° to 90°, as sun avails, and close so as to run up to 95°, or even 100°, with plenty of atmospheric moisture. A little ventilation about 6 P.M. will allow the vitiated air to escape and the temperature to fall gradually, but this is only necessary in closely glazed frames, pits, or houses, and when the weather is warm at night. Add fresh soil to the ridges or hillocks as the roots protrude, and press firmly. Syringe the plants in houses at closing time, and damp well in the morning and in the evening of hot days. Plants in frames should be sprinkled at closing for the day, keeping the water from the collar. Afford liquid manure copiously, always weak and tepid, and keep it from the foliage of frame plants, which in exceptional cases only need manurial applications, as they root into the fermenting material and grow quite vigorous enough without manure water.

Afford support to the fruit in good time, placing slates under those in pits or frames. Keep the foliage fairly thin, avoiding removing a large quantity of growths at one time, as this induces gumming. As the fruit approaches ripening reduce the supply of water at the roots, but not to cause flagging, and admit a little air constantly, withholding water from the fruit. Cracked fruits are mostly caused by a moist atmosphere at night, but any plants that become stunted while the fruit is swelling, and then given more generous treatment, are more subject to this defect than those encouraged in the early stages of the fruit swelling, and afterwards kept rather dry for ripening. This is

essential to secure high quality in the fruit.

cucumbers.—A few seeds may now be sown for late summer and early autumn fruiting. The plants from this sowing will be fit to plant out in about a month; they do well in frames, and the fruit is finer than that of old plants. Plants in full bearing must have attention in thinning exhausted growths, removing tad foliage, stopping, tying, and regulating the young so as to keep up a succession of bearing wood. Add a little fresh loam to the surface from time to time, and if sprinkled with some bone superphosphate occasionally roots will multiply at the surface, where they can be fed by light mulchings, as advised for Mel ns. Supply liquid manure in other cases copiously once or twice a week, according to circumstances. Syringe at closing time, and maintain a good moisture all day by damping surfaces. Flagging must be prevented by employing a shade lightly for a few hours in the forenoon and midday when the sun is powerful. Avoid too much moisture in dull weather; it only tends to promote soft growths, and renders the foliage more susceptible to injury on a bright period ensuing. Close early or before the temperature has receded to 80°, and so as to gain 5° to 10°, only employing fire heat to maintain it at 60° to 65° at night, and 70° to 75° on dull days.

THE KITCHEN GARDEN.

Tomatoes Under Glass.—If the stems of those late planted are abnormally thick, more especially towards the points, the young leaves also curling badly, this is a sure sign that the treatment has been too liberal. Tomatoes should never be planted in very rich soil, the other extreme also being avoided, what assistance they require in the shape of fertilisers being best applied from the surface. If, therefore, they are growing too rankly give less water at the roots, and keep up a good circulation of warm dry air. Should there be plenty of head room, allowing some of the side shoots to spread, laying these in not less than 12 inches apart, and pinching out all secondary growth is a good preventive of grossness, and the same plan may be followed in the case of plants trained or staked uprightly, a shoot being reserved on each side, always provided this can be done without any undue crowding. If the fruit fails to set well at this time of year this is almost a sure sign of either grossness, or the other extreme poverty at the roots. Those swelling off extra heavy lower clusters of fruit soon give signs of exhaustion of the soil unless well fed, the haulm becoming thin and hardening prematurely, and the bunches of flower puny, also failing to give fruit. Anticipate this by surfacing over the soil with a fairly rich compost, liquid manure also being freely applied. In the case of market growers top-dressing with compost would be a too expensive proceeding, but where the soil is at all poor and non-retentive a mulching of short manure ought to have been applied some time since to the plants cropping, and to those later planted before they had made much Where the soil is either non-retentive of moisture or naturally progress. poor, water ought to be supplied to the borders very freely during hot dry weather, twice and sometimes thrice in a week.

Tomato Diseases.—Complaints of disease attacks were rife even during the exceptionally hot and dry weather so long experienced, and now that a change to weather of a somewhat opposite character has taken place the chances are that diseases of a fungoid nature will spread rapidly unless timely preventive measure are taken. Wholly dispensing with fire heat was a great mistake, and many will have good cause to regret this false economy. The circulation of warm dry air is one of the

best preventives of disease, and also promotes a hard, productive habit of growth in the plants. Watering ought always to be done as much as possible in the morning of clear days, and the foliage wetted but little if at all. Creating a soft moist atmosphere such as suits Cucumbers well is just the condition that favours a spread of disease. Where the Cladosporium, which is quickly recognisable by the broad yellow spots on the upper surface of the leaves, is rapidly spreading, something drastic must be attempted to stop its progress, or the whole of the fully formed leaves will be quickly ruined by it. "Killmright," frequently advertised in these pages, where given a fair trial, has been found an effective preventive. It is the under side of the leaves that should be reached principally, that being where the disease germs lodge and spread.

Mushrooms.—Manure ought now to be collected and prepared for making into Mushroom beds, more especially in the open or other quarters than the Mushroom house proper, the latter being largely reserved for the later or cold weather crops. Open air beds have of necessity to be ridge shaped, and the materials used should differ somewhat from those required for flat beds. Do not wholly separate the litter from the droppings, the correct course being to reserve about onethird of the short stained straw with the manure, and to take good care of the longer portions for the purpose of well covering the beds after they are made. The beds may be of any length, about three loads of prepared manure being required to make a bed 3 yards long. Do not leave the stable manure for weeks together in a heap or pit to overheat and become dry and musty, but keep it well opened out till enough has been savel for a bed, then fork away the long strawy portion, and throw the rest into a heap to ferment. In the course of three or four days, or before it is violently hot in the centre, turn the heap inside out, gently watering it if at all dry. Continue this treatment about every second day for the next ten days or fortnight, and by that time there should be a good heap of well sweetened steadily decaying manure ready for making into a bed. If the first bed is to be a flat one and formed under cover of some kind, more of the stained straw should be forked away from it; but in other respects the method of preparation ought to be much the same as that just detailed. Good fresh spawn is always to be preferred to any that is either cheap and stale, therefore order the requisite supply from a reliable source in readiness for use when warted. Any beds formed and spawned early in July with a view to having Mushrooms from the middle of August onwards require particularly good attention. Unless the manure has been very well prepared it will heat very violently, the centres of the beds attaining a white heat, and the manure generally spoilt for the growth of Mushrooms accordingly, while if it is too dry decay will cease, and an insufficient moisture be the cause of the Mushrooms failing to appear in due course.

PLANT HOUSES.

Begonias.—Plants of various kinds intended for autumn and winter flowering should be placed into the pots in which they are intended to flower. After potting, put the plants in cold frames, and keep moderately close until established, when give more air. Shade lightly during the brightest part of the day. Insert cuttings of B. Ingrami in thumb pots. These will be useful early in the year as plants in 5-inch pots. This variety, if placed in baskets of moderate size and the plants pinched for a time, will yield abundance of flowers in the autumn. Cuttings of B. nitida and its variety rosea may be inserted at once. These are useful for flowering in the stove early in spring.

Euphorbia jacquiniæfiora.—Place all the earliest-rooted plants in the pots in which they are to flower, and when established gradually harden them to cool frame treatment. Turn these plants to the sun, so that the wood ripens as it is made. Insert cuttings either singly or a number together. If the latter the cuttings should be placed round the side of 5-inch pots, and if properly grown will not attain more than 1 foot in height; they will prove useful for various decorative purposes. The old plants may be cut back and placed in warmth until they break into growth, when repot. Do not overwater these plants.

Panicum variegatum.—When decorations have to be carried out

panicum variegatum.—When decorations have to be carried out on a large scale well furnished plants in 5-inch pots are very useful. Cuttings should be inserted thickly into such pots. They will root freely in any moist shady house. They can be stood on the floor if no more suitable position can be found them. Well developed plants in baskets are very effective, especially when grown in warm houses and suspended from the roof amongst Palms and other green foliaged plants. Fittonias are also very useful, and should be extensively grown.

Poinsettias.—These ought to be in cold frames and grown fully

Poinsettias.—These ought to be in cold frames and grown fully exposed to the sun. Those still in small pots repot from time to time as they need more root room, using good loam, sand, and one-seventh of decayed manure. Established plants may have a little artificial manure applied to the surface or given clear soot water occasionally. Water carefully, and syringe the foliage twice daily.

Justicia flavicoma.—Few plants are more worthy of extended cultivation in gardens than this old Justicia, especially for warm conservatories and intermediate structures. Its cultivation is easy when plants are raised annually from cuttings. The cuttings should be rooted and grown for a time in heat, and when well established gradually

hardened and grown with Euphorbias and Poinsettias until September.

Caladium argyrites.—Plants that have been used for decoration and have become shabby should be rested and then again started into

growth, when they will be found useful. A supply of this useful foliage plant in good condition for furnishing in occasional batches will be found very useful.

APIARIAN NOTES.

PREPARING FOR THE MOORS.

AMONGST my letters on the morning of the 26th, one from Crawford stated "The Wild Thyme is in its prime, owing to the great heat and dry weather. The Heather has made long growths, the young Heather is flowering, and in eight or ten days will be well in bloom." It will be observed that dry weather favours the Heather, and this year it is about six weeks earlier than usual. The Clover serson is only beginning with us, the Heather is ready, and

the highly prized Thyme will soon be past.

After a week's rain and cooler weather a renewal of the high temperature has taken place. A few days' continuation will favour the filling of supers but cause the hives to heat, which makes it very risky for moving bees such long distances. The Heather and the Thyme honey is the most valuable, so we must risk the adventure. Our hives are in excellent condition for moving to the Heather, being well ventilated from below a few days previous to starting, then the supers uncovered a little or wholly at the top, the lid of the super case or protector not being quite close permits the heated atmosphere to pass off, and gives a slight current of air. As the doorway is completely closed the bees do not make an effort to escape. Hives so managed cannot with ordinary care get overheated.

PUNIC NUCLEI AND PUNIC QUEENS.

I have formed a few nuclei of pure Punics, and intend taking them to the Heather a week earlier than my entire stock, for the purpose of making a trial whether they can be kept pure at that place. Punic queens are so numerous that they are very serviceable to supply stocks that may be queenless. My old Punic stock has been divided and swarmed into seven, and it may swarm again. It is surprising to see how active the smallest of these swarms work and gather honey. My old stock swarmed twice within an hour, and both are doing well.

MUTILATED QUEENS AND SWARMS.

One day lately I saw an enormous number of drones on the ground, and on the alighting board a few bees were caressing a spot where probably a queen had stood. A few days later a similar thing occurred, and to my astonishment I saw an abnormally lengthy queen enter the hive. It struck me that the queen being unable to fly had crept to the ground, and then up on to the landing board which touches the ground. As this queen is a

month old it is evident she was unable to fly.

To the bee-keeper there is nothing more tantalising than to have several hives issuing at same time without the slightest warning. Such a thing happened to me on the 26th. During a bright blink of sunshine between drenching showers, no less than six swarms commenced to come off at same time. Two were intercepted and three hived. One of the three, through either a stranger queen or bees, returned to the parent hive. One swarm refused to enter a hive. A heavy rain fell, which threatened the destruction of every bee, as they were scattered about, but byand-by I managed to get them to take to a hive. On some future occasion I will revert to the subject, as it is important beginners should be well posted up in hiving swarms.

PREVENTING BEES SWARMING.

"B. B. H." wishes to know something about preventing bees swarming. There is no method of managing bees that will prevent swarming at all times, nor perhaps at any period when circumstances are favourable to it. A young queen with plenty of breeding space is the surest of any. The plan mentioned on page 512 last volume was not found out by Mr. Simmins, but has been practised with the Stewarton hive for at least half a century, contemporaneous with the two queens in one hive system. The plan Mr. Simmins adopts I believe is this. The sections are placed in the front of the hive where brood combs used to be put by him to prevent swarming—i.e., the combs are parallel to the entrance, and it is in the front of the hive or in advance of the brood nest the sections are put, then when well begun they are lifted above. The principle is identical to the way we manage our hives under the Stewarton system, and is no doubt the best plan known to delay or retard swarming when a young fertilised queen is not at hand. We do not know whether the hive mentioned is adapted for the purpose. The Lanarkshire hive is suitable for all places and all modes of management.—A LANARKSHIRE BEE-KEEPER.

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Books for Examinations (M. B.).—You had better write to the Secretary of the Royal Horticultural Society, 117, Victoria Street, Westminster, S.W. The list first published by the Society was far from perfect.

Grapes Scalded (J. G.).—You should have sent sooner. The night temperature has perhaps been too low, and the house not properly ventilated sufficiently early in the morning. This is all we can say this week.

Cymbidium Seed (F. J.).—With no more convenience than is mentioned in your letter, we think the experiment of raising Cymbidiums from seed is scarcely worth trying. Even were you successful in germinating the seed, it would be many years before the plants flowered, and then it is quite probable that the flowers may be of an inferior type. It would be advisable to remove the seed pod at once if you decide not to try the experiment.

Thuia Hedge (Grove).—No doubt the nurseryman is right in respect to his particular plants. The smaller would be likely to grow better, and make a screen sooner than the larger ones if these have stood long in the nursery ground without being transplanted. In our experience Thuia gigantea, often sold as T. Lobbi, makes a more pleasing screen, and continues so over a greater length of time than does T. occidentalis; but tastes vary, and you may prefer the latter. The leaf, a very fine one, 11×8 inches, is Hedera coriacea.

Preserving New Propagating Wood Trays (D. I.).—Although creosote is used for dipping Hop poles, by which process they are rendered durable, we have no experience of it for cutting boxes, and should be obliged by particulars of its use in preserving wood from decay, both as to the strength and manner of application, whether applied hot or cold, and when steeped, how long, also whether it is likely to prove injurious to the cuttings or otherwise. We do not think it would be, but assurance on the point is desirable.

Worms in Flower Pots (Perplexed).—Worms can be expelled from flower pots with lime water made as advised to another correspondent under the heading of Chrysanthemums. The best plan, however, is to prevent their getting in first by carefully examining the soil before potting, then by using Porter's invincible crocks as a flooring in flower pots before placing in the ordinary drainage. These are an effective barrier to worms, while allowing superfluous water to pass away. Moreover, they are so cheap that a hundred can be had for 3s.

Grapes and Maggot (J. P. E.).—The maggot you send is the larva of a small moth, Tortrix angustiorana. You will have no difficulty in seeing the moths as they flit about in the egg-laying season, on the Vines being disturbed. Every one should be caught, also the maggots, which let themselves down by a web when the Grapes are moved. have known this pest do much harm in puncturing ripe Grapes and these communicating decay to others. The Tortrix is supposed to have come from America, and has not been prevalent in this country very many years.

Artificial Manure for Top-dressing Chrysanthemums and Roses in Pots (Constant Reader).—1, The mixture you name—three parts bone superphosphate, two parts powdered saltpetre, and part ground gypsum, mixed, and kept dry, is an excellent manure for Chrysanthemums and Roses, also any plants requiring support and growing in loam, or being of a free-rooting nature. It must not, however, be used for delicate rooting plants, as Heaths and Azaleas, nor be given excessively to any, but judiciously employed it is excellent. 2, Bone superphese hate is generally sold at 7 a per ant the price heins more for superphosphate is generally sold at 7s. per cwt., the price being more for less quantities, and less is charged for greater weights.

Gooseberry Leaves and Fruit Damaged (F. I.).—The spray is, barring the affected leaves and fruit, in excellent health, the wood being stout and short-jointed, and the foliage thick. There is no disease, but the whitish leaves have had their chlorophyll abstracted by some insects, popularly termed red spider, which have been unusually prevalent this season, and completely arrested the growth of the bushes in many places during the drought. Probably the rain has washed off the

MHOUGH no plants are probably more easy to grow than 1 Tomatoes, none appear to give more trouble to many persons who essay their cultivation. Notwithstanding all the information that has been given in our columns from time to time by men who have succeeded in growing the most satisfactory crops and men who have failed detailing the cause of their failures and eventually winning success; and notwithstanding the replies that have been given, we had almost said over and over again, in our answers to correspondents' columns, on almost every conceivable point in connection with Tomato culture, Tomato diseases, Tomato prices, further inquiries, perplexities, disappointments, regrets, challenges relative to the soundness or otherwise of advice that has been given, come pouring in. All this betokens wide interest in Tomato culture, and we are g'ad that it is so; but we are not exuberantly delighted when we find among our correspondents a select few who, after all that is done to help them, disposed to question almost every statement, and express regret that some other information was not given them, or different steps taken in dealing with a case, or cases, imperfectly presented.

Tomato culture is a question of common sense. It cannot be successfully conducted by a course of elaborate argument founded on fanciful theories deduced from conflicting results that have been observed under varying conditions, the significance of which can rarely be appreciated by inexperienced people. Than assisting those who have not been taught in the school of practice, and giving hints of guidance that may be helpful to them, we feel nothing more pleasurable. It is work in which, after years of experience in it, we do not grow weary; but we have a right to expect that the advice we take pains to give shall be followed intelligently and perseveringly, as in no other way can its soundness be tested and benefit derived from it. This, we have good reason to believe, is the practice of at the least 90 per cent. of seekers for information. Not a few have found the advantage of their own efforts in that direction, and a very substantial advantage it has been to many; but there is a residuum. There always is in every body of individuals who have a common object in view, who do not appear to be able to accept plain teaching, and turn it to practical account. They prefer, like a certain Handy Andy of old, to argue the point.

We may tell an inquirer that the night temperature of his Tomato house has been kept too low by the want of a little warmth in the water pipes, and he retorts by saying that so-and-so has no means of heating the house in which he grows healthy plants free from the disease and obtains good crops of fruit. Evidently he assumes the low night temperature theory is all fudge. We may inform another querist that he errs in his method of ventilation, and forces his plants too rapidly into growth when young; that he ought to strive for firmer growth, employ less moisture, and provide more air. Such advice does not quite fall in with his views, because he has been told his plants have had too much air. A third does not seem able to move a finger in checking disease till he learns not only the generic but the precise specific name of the attacking fungus; yet he is told of measures that if promptly resorted to and properly carried out will arrest the spread of all fungi. He sends an apology for a Tomato leaf which arrives like tinder through its enclosure in a letter and the paper abstracting from it what little moisture it contained when plucked from the plant. He is asked to send fresh specimens, so packed that they may arrive in a fresh state. He then plucks two small leaflets, throws them into a box that would hold fifty such like, without anything to keep them fresh and firm, never thinking that by the shaking they receive in the post in their dry enclosure and a "roasting" temperature, that they arrive much in the same state as if they had been carefully pressed round a heated curling iron. He is told the nature of the disease and how to proceed; but that is not enough, and he must have the exact name, sending at last a sample encased in a Cabbage leaf. This sample arrives fresh with the fungus all alive, and is identified at a glance.

In consequence of the thoughtlessness of the sender in that case and nothing else, and his want of the "name" of the foe, it has been afforded an excellent opportunity to establish itself, and has done so, for the last leaflet received was worse than the first. Yet the steps to take in dealing with such attacks were plainly and fully given a fortnight previously. That is a case of grasping after a shadow and losing the substance, or a resort to pedantic rather than common sense methods in the emergency. There may be yet time to save the plants, and we strongly hope the enemy will be conquered; but whatever of failure ensues will be through the mistake of the owner and no one else, though we may expect he will be the last to admit it; but the fact does not permit of argument.

We are as pleased to acquire information from experienced correspondents as we are to impart it to the inexperienced; but when the latter rise superior in their knowledge to men who have won success through many long years of labour, study, and observation, we have to place ourselves on their side, and not silently permit their teaching to be questioned and controvened by dialecticians, who, by lack of cultural knowledge, are apt to base their arguments on false premises, and do so base them.

Because Tomatoes are healthy and free from disease in glass structures, in which there is no means for supplying artificial heat, that is no argument that the fungoid disease will not attack the plants that have been grown with the aid of artificial heat, and this withdrawn to save fuel. There is no analogy between the two cases. We know of Tomatoes as healthy as plants can be, and ripening excellent fruit in elevated Pearson's frames that can only be heated by the sun. The plants were sturdy and strong requiring no stakes to support them when planted from 5-inch pots, nor for some time afterwards. They were planted in fresh loam, not rich, but very firm. They were not watered daily, nor bi-daily, often not more than once a week, on a bright morning, sufficient air being given so that the surface of the soil became perfectly dry before night. Failing this it was dusted with dry soil. On cold clear nights the glass was covered to prevent too great a disparity between the night and day temperature. With the comparative absence of moisture in the frame, and the leaves not unduly cooled, there was no appreciable deposition of dew on them. They have never been syringed. The stems are short-jointed and firm, the leaves not particularly large, but remarkably thick and rustle like parchment. The plants produced a mass of flowers, clouds of pollen, and are now laden with fruit. There is not a speck of disease on them. They are in a condition to repel rather than favour parasitic growths. They are fully ventilated in the day, moderately at night, air being increased very soon after the sun reaches the frame at 5 AM. So long as there is no Potato disease about, nor Tomatoes affected with either the Phythopthora and Cladiosporium fungi in gardens near, the system of ventilation will be pursued, always in accordance with the weather; but should those fungi appear anywhere near outside the Tomato frame this would be kept closed entirely at night and practically in the daytime to exclude the fungus spores, and the later fruits would ripen well. It is surprising the heat that

Tomatoes will endure, and the drought they will resist. They are all right in a close dry air, like a desert, but would soon be a mass of decay if kept close and moist.

Contrast the plants alluded to with others grown in a heated house, watered probably too often, syringed, it may be, too frequently. A night temperature of about 60° has been provided, and a genial atmosphere maintained to "encourage" growth and obtain early fruit. The soil in many such cases is too much in bulk, too rich, and too lightly put together. The growth of the plants is succulent rather than firm; the stems rather long than short-jointed; the leaves large but thin and soft in texture. Space is covered freely; the days are hot, and a few nights warm. Then the thought arises of saving a shilling or two by ceasing firing. The pipes get stone cold, there is a sudden fall in the night temperature outside, and of course in. The house has been sprinkled, and there is consequently moisture in the atmosphere which condenses on the colder leaves, and if there are fungus spores about they find the precise conditions for germination, both as regards moisture, leaf texture, and temperature. In a warmer, drier atmosphere there would have been no moisture on the leaves for the tailed zoospores to float in-the real communicators of disease-and the plants would remain healthy. They are first made tender with fire heat, this is withdrawn, and they are then made vulnerable to the disease; the historic "'haporth o' tar " is saved, but the ship—the Tomato crop—jeopardised.

That Tomatoes like abundance of air is evident by the sturdy, healthy growth of plants now ripening excellent fruit in the open air; also in frames with the sashes drawn off most of the time. But that is because the air has been dry and days warm and bright. Had the weather been close and wet with a murky atmosphere the fungoid enemy would probably have taken possession of them. In large, airy, heated houses the right conditions can be maintained. The chief requirements are a free circulation of air, but please mark well-it must be warm, dry, or dryish air, not chilling currents, while a close moisture-laden atmosphere is a forerunner of diseased plants. Dry heat on the other hand is inimical to fungoid growths on the plants, as many large growers have found who provide them with a temperature of 80°-90° over three or four days and nights. Bordeaux mixture and other preparations, which have been repeatedly named, will if applied in time be of enormous benefit; but it should be remembered that they are preventive rather than curative. This has been said at the least a hundred times, and will perhaps have to be said a hundred more, before the fact takes possession of the minds of all Tomato growers. We should like to reduce their difficulties and ours too.

SHADING FRUIT HOUSES.

It has long been an established belief with many fruit growers that shading under almost any circumstances is inimical to the well-being of fruit trees, whether they are grown under glass or in the open air. They are, moreover, inclined to look with a combination of mystery and contempt upon the cultivator who advocates and practises giving shade to Vines or Peach trees, except in the case of newly planted ones or those carrying a crop of ripe fruit, these being exceptions in which shading is generally acknowledged to be beneficial. That harm may be done by overshading I do not deny, but between this and the other extreme of not shading at all there are instances innumerable in which shade when judiciously given is productive of superior results, which under similar circumstances in other respects could not be obtained without its aid.

It might be advanced that I have chosen an exceptional season during which to bring this matter forward, but in my opinion there are times in the majority of summers when fruit houses may with advantage be shaded, although perhaps it may be only in hot seasons that converts to the practice are so readily made. Red spider is at present unusually rampant in houses which during ordinary seasons are entirely free from it, and I am fully convinced that where such is the case a much more satisfactory state of affairs might have been maintained had timely shade been given, for it frequently happens that during a long fight against drought

Vines and fruit trees do not get enough moisture at the roots or in the atmosphere. Shade, by lessening evaporation, would have done away with the necessity for so much water. The supply given being, therefore, more proportionate to their requirements would have maintained the trees in a healthier condition, in which state they do not easily fall a prey to the attack of insects.

In determining whether or not the practice of shading fruit houses at certain times is a good one, we must bear in mind the great diversity in the size, situation, and construction of the innumerable houses in use for fruit growing throughout the country. Some of these being small, imperfectly ventilated, and situated in very warm positions are veritable sun traps, in which during a season like the present it is almost impossible to keep either plants or fruit trees healthy without resorting to shade. In such instances the Vines or fruit trees growing in them should be shaded by the time the growth of the fruit stops temporarily till the stoning process is completed. A little whitening strained through a fine wire sieve mixed in water, and syringed evenly over the roof, effects the object in view. Light houses, the framework of which is iron or other metal, ought also to be similarly treated, for however large they may be, the materials used in their construction being such great conductors of heat as well as cold, render very strong sunlight too powerful for vegetation growing inside them, especially if trained near the roof. Houses of all descriptions are now built much lighter than formerly, and for this reason alone it is absolutely necessary to provide shade for many plants, which under more antiquated conditions did not require it.

Thus far I have dealt with the management of houses requiring special treatment in the matter of shading, and I wish it to be distinctly understood that I do not advocate the indiscriminate shading of all fruit houses at the stage above indicated, though in nearly all instances a little shade later on is beneficial should the weather prove hot. The exact stage at which I consider this should be given I will endeavour to describe. Black Hamburgh Grapes colour best when direct sunshine does not reach the bunches during the latter part of the afternoon. I have always experienced the least difficulty in colouring them perfectly where the aspect has been an east one. When dealing with a house principally occupied by this variety, and having a southern aspect, I always give a light shade after colouring has fairly begun all over the house provided the weather is bright at the time, and I am convinced the practice does much toward securing good colour and bloom. With a house having a west aspect the practice is quite as necessary, for the sun generally comes upon such a house suddenly, and with full force near the middle of the day. The rapid change thus brought about is not conducive to good colour in the fruit. Madresfield Court will colour under bright sunshine better than any black variety I know, but even this should be shaded when fully ripe, or the colour will not be retained. If Muscats are trained from 2 to 3 feet from the glass, shading will not be required till the fruit is ripe to prevent shrivelling, but in many instances the rods are unfortunately not more than 15 or 18 inches from it, often a less distance than that. Under these conditions during hot weather the leaves cannot properly perform their functions. In such cases a light shade when the colouring process is somewhat advanced is of great benefit in preserving the foliage in a healthy state, a few of the main leaves immediately over the best bunches being afterwards tied back to allow the fruit to get plenty of subdued light.

Turning to Peaches and Nectarines I find the former will bear sunshine with impunity much better than the latter, and it is only when trained very near the glass in particularly hot positions, or very small houses, that shading is required till the fruit commences ripening. If it is necessary to retard this a canvas shade should be given. If only to prevent the fruit drying by sunshine, whitening applied with a syringe will answer admirably. Nectarines require more careful treatment, especially such varieties as Lord Napier, Pineapple, or Victoria; these become much disfigured, and frequently burnt, when disposed near the glass unless shading is resorted to shortly after colouring begins.

Intimately connected with the question of shading is that of training the shoots of Vines and fruit trees at a reasonable distance from the glass, and until the advantage of the latter practice is more fully recognised shading during hot weather becomes imperative if the best results are to be obtained.—D. W.

INSECTS OF THE FLOWER GARDEN.

(Continued from page 476, last vol.)

THE dry spring and summer of this season have had very remarkable effects upon animal as well as on vegetable life. I have observed that among the spiders many have made more rapid progress towards maturity than is usual; this may be because the

continued warm weather has hastened on those frequent changes of skin through which these insects pass, or perhaps their food has been extra abundant, the development of numerous species having been earlier from the cause just mentioned. Along the lanes in some parts of England the profusion of spider webs on the banks has been noticeable, these appearing very conspicuous. Owing to the dryness of the herbage, also from the absence of rain, the spiders have not had to expend silk in the manufacture of new webs, so

have used the material to strengthen the old ones.

About gardens spiders have been plentiful, but in these they meet with molestation, if they escape with life, few people being of Mr. A. Murray's opinion, that "spiders are the most powerful insect friends of mankind." Obviously, in the case of the web Obviously, in the case of the web makers, those that furnish food to the spiders are only a percentage of the insects that are snared and killed; and in the group of hunters, though the species are less destructive, each victim being a separate seizure, they are abundant and very I find it is a common supposition that spiders are blind, but they have from two to eight simple eyes, though in securing their prey they seem to be principally guided by the sense of touch, and not sight. A proof that they do see is the excitement they may be noticed to manifest when a party of social flies are passing their webs. By sight, too, evidently a spider decides concerning some insects it may capture in its web but does not choose to meddle with, and therefore ejects by cutting the cords round them, or else leaves them alone. It is not at all uncommon in the garden to see an unlucky earwig struggling in some spider's web, and we should be grateful to the insect if it helped to diminish the numbers of this foe to choice flowers; but usually spiders refuse to touch earwigs. Apparently the forceps at the tail of an earwig, which has no power as a weapon, and serves to adjust or fold the wings, is regarded by a spider with alarm.

Many caterpillars fall by accident, or are blown, into spiders'

Many caterpillars fall by accident, or are blown, into spiders' webs; some of these are not to the taste of a spider, and so they are left to escape if they can; some are secured, and afterwards sucked. It is amusing to see a spider's surprise when it has in its web one of the leaf-rolling caterpillars that may have dropped from some Rose. The spider turns it round and round in silk, hoping to secure it; but the captive objects to the operation, and unrolls itself speedily, having plenty of muscular force, till the matter is ended by some punctures from the spider's fangs. Hunting or wandering spiders are seldom killed by gardeners, except accidentally. The web-makers are not unfrequently destroyed with their webs; we must sometimes remove these, but if we gave the worker a chance of escape it might spin another web in a spot where it would kill insects without annoying us.

I have already referred to the conspicuous and regularly formed webs of the spiders which are well known in our gardens, and by which hosts of insects are captured to our benefit. Very different webs are formed by other spiders; that of Ciniflo ferox and its relatives, for instance, is so irregular and ragged that it looks like an old or waste web. But it serves as a snare, and is indeed very sticky, taking many small insects, though it appears open. One thing is that some of the threads are fine and scarcely noticed by the eye; under the microscope they are beautiful in form, also having a bluish tint. Then there is the spider often called daddy longlegs, though the name is also given to the crane fly. This occurs both in and out of doors. The web is placed on walls or palings in gardens; it is loose and net-like. The maker, in science called Pholcus phalangoides, frequently wanders far from its web. The pale body, which is slightly marked, is long; the legs much longer, with knee-joints curiously thickened.

In the genus Therideon, where the rounded abdomen of the spider overhangs the thorax, the snares that are made are very irregular fine threads running in various directions over the tops of plants or the sides of bushes. Occasionally we notice about the flower garden the cocoons made by this genus for the protection of their eggs. A familiar one is that of T. pallens, a little brownand-white spider, which puts its cocoon on the under side of some leaf. This few would connect with the spider; it is a Pear-shaped object of a glossy white, and has several points projecting from Another species, T. lineatum, which has black lines on its greenish body, secures its cocoons from peril by doubling over the leaf on which it is placed. This cocoon is round, and blue or bluish green. A species rather uncommon makes in gardens a tentlike nest, about 2 inches long, close to the irregular web. It is generally not far from the ground, and the spider called T. riparium roofs it to keep out the rain, covering the top of this nest with fragments of earth or bits of leaves and flowers. The eggs are enclosed in a slight covering of silk as well. What is more remarkable in this spider's history is that she feeds her progeny for some time, and they live amicably together; the food is chiefly ants, it is stated, which she catches on the soil or on twigs. A Therideon that is abundant about gardens in South Europe is much favoured

by growers of Grapes, because they think that its filmy webs extended over the Vines keep away some insects from the ripening fruit. There is a larger species, brown in colour, mottled with black, that is found in many conservatories, and which is supposed to be of foreign parentage, having been imported with plants. A species allied to the preceding constructs amongst masses of foliage in gardens and shrubberies a web, which appears large as compared with the size of the spider, Linyphia montana, which, though small, is active and ravenous; it is greyish brown, or sometimes blackish. The snare it constructs is a fine horizontal sheet, over this are suspended numerous lines crossing each other, and some helping to secure the web. Insects that might escape this strike against these upper lines, and falling are seized by the vigilant spider below.

Prominent amongst the hunting spiders are those of the genus Thomasus, mostly garbed in showy tints of black, yellow, green, and red. They are decidedly crab-like, having broad bodies, and long, powerful fore legs; some of them that chase their prey can move either forwards, backwards, or sideways with great rapidity. Others have a habit of lurking in crevices, or under little stones in the soil. The common wolf-spider (Lycosa saccata) has its Latin name from the bag of eggs which the female is often seen dragging about. This is a wandering spider, allied to the famous tarentula of Italy. Some hunting spiders leap upon their victims. Salticus scenicus is one of these, frequent upon the leaves of garden plants; it destroys many flies. We know it by the grey ground and white bars, also by its habit of jerking out a thread when it springs.— Entomologist.

STRAWBERRIES IN HAMPSHIRE.

In spite of the great heat and drought experienced some market growers consider this to be a good season for Strawberries. There may not have been such a quantity of fruit as in some seasons, but the prices have ruled fairly high throughout. The Strawberry crop in this neighbourhood was an early one. Picking commenced May 14th with some growers as compared with the first week in June in past seasons. The best price realised that I can hear of was 5s. 6d. per gallon of about $5\frac{1}{2}$ lbs., or 1s. per lb. By June 8th the price had dropped to 2s. 6d. per gallon, a little later to 1s. the gallon; even at this price the crop is remunerative.

Strawberry growing for market in this part of the county is undoubtedly on the increase. Within a radius of five miles from Botley there cannot be less than 400 acres under cultivation, ranging in plots from a quarter to five acres. From Botley Station the bulk of the fruit used to be sent, but since the opening of the line from Fareham to Netley much of the fruit is despatched from Swanwick, a small station on that line. The output from this station alone was from 30 to 40 tons per week, as many as 50 tons going away in one week. The punnet and box are now superseded by cross-handled baskets holding one gallon each, as many as from 15,000 to 16,000 leaving the station named in one day. So much has this method of despatching the fruit come into vogue that the railway company have specially fitted vans with tiers of shelves for the reception of these baskets. The simplicity of these baskets is all in their favour; no packing material whatever is needed, the fruit is picked direct into them, a sheet of white paper is fastened securely over the fruit by tying it to the basket rim. The fruit is picked before it is dead ripe and therefore does not suffer in transit, but any barely ripe at the time of gathering becomes thoroughly so during the long railway journey to the midland and northern towns. Some growers who send their fruit to the local towns of Portsmouth, Southampton, and Winchester pack in square light deal boxes holding a gallon; these being made of the same size, are easily stowed away tier upon tier in spring carts and vans without any packing material whatever. Some, however, lay a single frond of the common Bracken on the top of each box, which has a tendency to keep the fruit cool, but as the journey by road is done during the night or very early in the morning the fruit does not suffer from the effects of the hotsun. Much of the picking is done in the early morning, therefore is in a better state for travelling than when gathered during the daytime.

In a season like the present the quantity and quality of fruit vary according to the soil in which the plants are grown. In one garden, where the subsoil is clay, the top soil is heavy loam, the situation being low, the yield of fruit has been a heavy one. Several rows of plants (five years old, 18 feet long) gave one gallon of fruit cach at one picking, averaging 2s. 6d. the gallon, which cannot be regarded other than a remunerative crop. From the same garden 100 gallons were gathered at one picking, and sold at the price quoted, this quantity being taken from less than a quarter of an acre. This was the best picking from that plot, many more of less quantity being gathered from the same plot. These few figures tend to show the remunerative character of Strawberry growing when carried out on proper lines. The same garden of 13/4 acre in the Jubilee year yielded £3 worth of hay, which cost 30s. to make; it was then under grass. By degrees the whole of it has been broken up and planted mainly with Strawberries, which more than once since that year have given the occupier a net gain of £100.

As to varieties, but few arc grown by the market men. Sir Joseph Paxton is the sheet anchor of the whole district. This sort is the best for either a wet or a dry season, grows freely and crops heavily, and is

decidedly better in flavour than is supposed to be the case when thoroughly ripened. Some plants of Noble are grown, but this variety does not meet with much favour. Instead of its being earlier in ripening it was this year behind the old favourite. A variety rather highly spoken of for its earliness is Eleanor.* Locally it is named Melton and Garnier's. It crops heavily and comes in quickly, but travels badly and soon decays after being gathered. Lucas is a favourite with some for its large size, but is looked upon as being "soft." Perhaps the earliest sort of all is Princess Frederick William, but owing to its extremely small fruit but few plants are grown. Alice Maud is much liked by some growers for the earliest pickings.

Strawberries in pots are found to pay by some with one or two small Those that get the fruit ripe by the 1st of April realise 3s. per 1b. Noble is highly spoken of for this purpose, owing to its free qualities. Sir Joseph Paxton, however, is preferred for its setting qualities. flavour. The plants are afterwards sold for putting out in the quarters; they give a full crop of fruit the following year, the price obtained being about 4s. per 100 plants.—E. MOLYNEUX, Swanmore

Park, Bishops Waltham.

[* Eleanor is a large late firm Strawberry.—ED.]

BORDER CARNATIONS AT CHELSEA.

Most lovers of border Carnations in the neighbourhood of London like to inspect the collection in the nursery of Messrs. Veitch & Sons at Chelsea, for a representative display of new and select varieties is always to be found there. It would be too much to expect that in such a parching season as the present the plants would be as vigorous and luxuriant as in former years. They have suffered, like everything else, from the drought, notwithstanding that the beds were carefully re-made, strong plants put out, and mulching resorted to. Moreover, the flowers have lost colour very rapidly in the fierce sun glare. "Here to-day and one to-morrow" has been the rule. Considering the disadvantages ander which the plants have had to fight the bloom is surprisingly good, few varieties being completely out of character, though not a few are

One of the most beautiful and promising of the novelties is Border Maid, a dwarf grower and very free bloomer. The centre of the flower is deep rose, the margins of the petals much paler. Few varieties have a more pleasing appearance, and, what is little less desirable, the flowers are very sweet. That it will become very popular as a general border and cut flower variety there can be no doubt, and it is quite within the bounds of probability that it will also become a favourite as a winter 30rt. Some plants in pots are noteworthy for neat habit and freedom of blooming. Near it at Chelsea are a quartette of good older varieurs—Magnum Bonum, scarlet; W. P. Milner, white; Alice Ayres, white with carmine flakes; and Celia, rose, all of which have good qualities with carmine flakes. to recommend them. W. P. Milner has hardly so good a flower as Mrs. Frank Watts, but it blooms more freely, and for cutting purposes is therefore quite as desirable. It is gratifying to notice how profusely the delightful Alice Ayres is producing its flowers under difficulties. A dark Fancy named Lord Beaconsfield is quite likely to win a good deal of admiration, and so is a purple self sport from it called William Tovey, which has a good flower and blooms freely.

The bizarres, flakes, and Picotees are too numerous for all to be The bizarres, flakes, and Picotees are too numerous for all to be referred to under name, and moreover most of them are well known; it will suffice to say that a complete collection of the best varieties is open to inspection. But there are many selfs and Fancies besides those already named which are worth a special reference. Beauty of Foxhall is one. It has a good flower, of which the colour is purple, is a capital doer, and an excellent winter bloomer. Lothair is another fine sort. The flowers are of a soft blush hue, at first showing a core, but subsequently developing admirable character and form. Brilliant is now pretty well known and is very difficult to excel in colour. Germania pretty well known, and is very difficult to excel in colour. Germania. too, is so familiar as to need no description, but there is a lemon-coloured seedling from it of beautiful form and quality, besides being a good doer. Rose Celestial is another of the time-tried sorts which have won lasting popularity, and in the same category may be classed the lovely Fancy Almira and Mrs. Reynolds Hole. Winter Cheer is even more sought after than this trio. A grander Carnation was perhaps never seen out, for it is as good out of doors in summer as it is in pots in winter. The large array of rose-coloured sorts is supplemented by Dr. Parker, an excellent variety for cutting; and Grant Allen, which blossoms up the stem very much like Alice Ayres, and possesses splendid colour.

The Picotee Carl Schurz, white with broad purple margin, has meritorious qualities, and so has the self Cantab, which might be classed as a scarlet Clove, possessing a full rich Clove perfume. It was raised by Gifford, and another of his seedlings is Sultan, a fine crimson variety. A third from the same raiser is Maggie Lawie, a free, beautiful, and very fragrant variety of the familiar Miss Joliffe colour. It ought to become a great favourite. Florence, buff, very free; Crimson Pet, which possesses an excellent bloom; and Empress, white with a stout smooth petal, all win admiration, and at least as much falls to the share of a Fancy emanating from Guernsey, and called The Lady. It is rellow with a deep crimson suffusion and blossoms in sheaf-like proyellow with a deep crimson suffusion, and blossoms in sheaf-like profusion. A pair of excellent varieties originating with Turner are Ruby and Queen of Bedders. The former is noteworthy for its brilliant colour and splendid petal, the latter for dwarf habit, free blooming, and bright shade of rosy red. Cara Roma is a good purple, having rich colour and

The season is not only earlier but will certainly be much shorter than

usual this year. Should the maggot supplement the effects of the drought by extra vigour, 1893 will be a year which Carnation lovers will not look back to with unmixed pleasure.

SCORCHED LEAVES IN VINERIES.

In this neighbourhood I have heard complaints of Vine leaves being scorched by the excessive sunheat. Not even during the Jubilee year was the sun so powerful as upon June 17th and the two following days. I do not allude to the scorching of the leaves in vineries caused by neglect in airing the house properly. Scorching perhaps takes place between the hours of twelve and two, and when sufficient air is admitted

for all ordinary circumstances.

Several reasons are advanced as to the burning of the leaves, but in my opinion in nine cases out of ten the right theory is not hit upon. I allude to the question of dryness at the roots of the Vines, and if this occurs scorching of the leaves will take place if every ventilator is wide When the roots are devoid of a sufficiency of moisture the foliage is robbed of its enduring power, rendered flabby, weak in tissue matter, and susceptible to the power of the sun. Very often the glass is blamed for the injury caused; it is said to be full of blisters or defects caused in the process of blowing, but it is strange these spots have not been found before when probably the vinery has been in existence twenty or more years. Experienced persons know that where any defective spots are present in the glass they have damaging effect upon the foliage, and the usual plan of dealing with these is to smear them over with white paint.

Varieties differ in their susceptibility to scorching. Perhaps Muscat of Alexandria is the most liable to be injured, Madresfield Court following, and then Mrs. Pince. Black Hamburgh is the least susceptible of any to this foliage defect. The varieties named possess slender leafstalks, more so than any other sort that I am acquainted with. This fact may have some bearing on the cause of why these slightly built leaf-stemmed kinds are more liable than those with stout leafstalks to scorching. Very often the damage done is owing to the outside border being covered during the winter, thus no rain can get near enough to it, and by the time the hot days of June come round the goil in the border is now days in the horder. the soil in the border is very dry in seasons like the present. Where the soil is light in character and the border raised well above the surrounding surface it is surprising what a quantity of water Vines will absorb, even when in an outside border.

The best way to prevent scorching of the leaves if the border is in want of water, whether it be an inside or an outside one, is to slightly shade the glass outside by aid of liquid whitening syringed on. has the effect of providing a slight shade, and is easily taken off after a day or two after the border has been well soaked. Of course a careful cultivator who has water at hand will never allow the Vines to suffer at the roots, but water in sufficient quantity is not available everywhere this season. I know a garden at the present time not far from here where every drop of water has to be carted over a mile. The person in charge cannot very well be blamed if a few Vine leaves should be scorched under such conditions.—S. P. H.

NIGHT-BLOOMING CEREUS.

MAY I, through the pages of your Journal, thank Mr. G. W. Cummins (page 6) for his kindly correction of my error as to the name of the second variety of Night-blooming Cereus that was formerly in the collection of my father, the late Mr. C. M. Major? Having referred to the references he gave I am quite satisfied that it must have been C. Macdonaldiæ and not C. nycticalus, as I was previously inclined to think. I have also no doubt now that the variety we lost must have been C. Maynardi.—MARK B. F. MAJOR.

I AM not responsible for about four lines in the note that appeared in the Journal last week (page 6)—viz., "The variety referred to (C. Macdonaldiæ) is the result of a cross between C. grandiflorus and C. speciosissimus. It was raised by Mr. Kenny, gardener to Viscount Maynard, Easton Lodge, Dunmow." According to the Journal for June 19th, 1884, this belongs to the history of C. grandiflorus Maynardi, and C. Macdonaldiæ is described as a species introduced from Honduras to Kew by Mrs. General Macdonald, and first flowered in the Royal Gardens in 1851.—G. W. CUMMINS.

The accidental omission of the specific names supplied by our correspondent led to the error, which we thank him for correcting.

I HAVE been much interested in the articles respecting the Night-flowering Cereus, and a few particulars of some plants I have here might be useful. I have four Cereus nycticalus which have opened as many as 111 blooms in one night. The largest plant opened fifty-four blooms on June 19th, and fifty-five on Saturday, July 1st. On several intervening nights there were from three to twelve flowers, and there are several yet to open. I measured one bloom on Saturday, July 1st. It was $9\frac{3}{4}$ inches diameter; but, unlike Mr. Major's plant, mine has white petals. I have one plant of C. hexagonus, which has opened fifty-six blooms this year, and has ninety more to expand. I have not seen more than eight open at once. They remain open until about ten o'clock the following day. The plant is 30 feet high, has two side branches about half-way up 8 feet long. The flowers are the same in colour as C. nycticalus, but smaller.—A. PARROTT, Crymlyn Burrows, Swansea.

CYPRIPEDIUM VOLONTEANUM GIGANTEUM.

COMPARED with the typical form of C. volonteanum the above is a decided improvement both as regards size and colour, and it is no wonder that the Orchid Committee of the Royal Horticultural Society deemed it worthy of an award of merit when exhibited at the Temple Show by Messrs. Hugh Low & Co., Clapton. The plant shown bore but one flower, but that was sufficient to indicate its distinctive character, which is pourtrayed in the illustration (fig. 4). The dorsal sepal is large, of a pea-green colour, the petals also being pea green in the middle, and covered with brown spots, margined light rosy purple. The lip is dark green shaded purple.

NEW CYPRIPEDIUMS.

Or more than 500 plants of Cypripedium Chamberlainianum which I have seen, says a writer in the "Garden and Forest," the variety magnificum is the finest and largest both in foliage and

flower. The plant measures 2 feet 4 inches across, and the leaves, which are faintly tessellated, are 3 inches broad. The polyflorous scape is pubescent; the flowers are borne one at a time, and each one measures over 4 inches across the petals. The dorsal sepal is $1\frac{1}{2}$ inch across, pale green, shading to primrose yellow on the margin, with ten dark brown rays, and pilose on the reverse side. The inferior sepal is pale green with brown rays. The petals are pale apple-green, with rows of brown purple dots, and are twisted in a reverse direction. The lip is 2 inches long, crimson, with the infolded lobes, base and the border of the aperture a pale yellow, the whole specked with carmine. The staminode is a deep glossy green.

The plant of C. Germinyanum aureum resembles the type, but the flowers are larger; the dorsal sepal an umber brown, bordered with dull orange; petals vinous purple on the superior half, and dull orange on the inferior half, dotted with red near the base; the lip a sombre orange, dotted inside with brown, the staminode yellow.

AMERICAN METHODS.

Our cousins are ahead of us. One of them, according to the "American Florist," appears to have been interviewing Mr. F. Sander by telephone on his visit to the World's Fair. Asked if he thought Orchids had a future as commercial flowers in America, Mr. Sander replied: "Perfectly sure of it. The demand doubles itself every year for cut flower purposes. The Orchid is the real élite of the flower kingdom. The Rose comes next. First of all the Orchid is very quaint

and extraordinary in form and shape; then you have in them all the colours of the rainbow; many are very sweet scented, and above all there is no flower of such lasting quality as the Orchid. If you don't want to cut it to-day you can cut it to-morrow or a month hence. That is not so with other flowers; the Rose must be cut at once. Orchids are often kept a month in water. There are some exceptions, but with nearly all this is true. Take for instance Cymbidium Lowianum. I have known it to last on the plant for three months, and cut for eight weeks. The love for Orchids has simply grown with education and wealth, and so it will grow from year to year, and as the supply of Orchids gets less so prices will advance from year to year."

"Then you believe that the time is coming when these plants will become scarce?"

"I am quite sure of it. Every ounce of silver taken out of a mine must make one ounce of silver less, and every Orchid out of the woods one less, and as they are slow growing and the competition is now very great in importing, the only pity is that soon the supply will not be big enough. Seedling growing is now beginning, but they can never be produced to the extent needed. I am quite sure that what I say is true, and you will find as the years roll on that I'm right.

"What are the most fashionable varieties in England at the present time?"

"Cattleyas and Odontoglossums are always fashionable. Through nearly every Orchid there is a trace of magenta, and they are very brilliant at night. Trianæs come out great at night, so does Phalænopsis Schilleriana. In England old gold colours in Orchids are very much in fashion now, such as Oncidium pretextum, O. Forbesi, and O. crispum. We never have enough of them, and the rage is spreading all over the world, in France particularly. It is nothing unusual for ten dollars to be paid for a single spike of Oncidium curtum. For a succession of bloom take the old Cattleya labiata, which comes in October and November up to Christmas; at Christmas Cattleya Percivalliana, which is followed later on by Trianæ and Mendelli. These are not expensive varieties, and the first year they will produce bloom enough to pay for the plants."

WASPS AND CYANIDE OF POTASSIUM.

I HAVE used cyanide of potassium since 1883 or 1884 for destroying wasps' nests built in the ground, and always successfully. My method is to take an old piece of sponge or flannel and wring it out with plain water, then let it absorb as much as possible of a saturated solution of the cyanide. It is then put, with a long stick, well into the hole, and left till evening, when a piece of turf should be placed over the hole. With

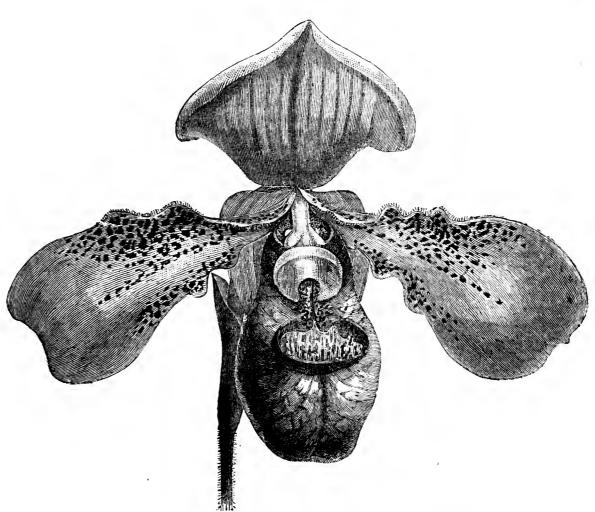

FIG. 4.—CYPRIPEDIUM VOLONTEANUM GIGANTEUM.

a very strong nest it is necessary to dig up the comb the following day, as the fumes of the cyanide do not affect the grubs.

The greatest care must be taken in using this chemical, as about half a grain is a poisonous dose, and the poison is equally active whether swallowed or taken in through broken skin. The fumes which are given off are dangerous to human beings. To be quite safe, after using the cyanide, wash the hands with a strong solution of sulphate of iron, and then with soap and water.—J. COCKBURN.

WASPS are unusually numerous here this year, and the nests are easily destroyed by pouring a small teacupful of turpentine in the hole at night, pressing a foot on to close the hole. It will effectually kill every wasp and grub, and there is no danger of accidental poisoning. Cyanide of potassium is dangerous, and, judging from my own experience, not effective.—Thos. Woodford, Atherstone.

SEEING a query as to results of cyanide of potassium on wasps on page 13 of last issue, I wish to state I have used it this season, having during the past few days taken about thirty nests, some exceptionally strong ones. I find it does not kill the larvæ, but all the ingoing wasps. My mode of procedure is to go around the nests, dropping in a table-spoonful of cyanide of potassium (liquid form), and in a short time afterwards, not a wasp being seen, I dig the nest out and burn it.

The advantage of using the above in place of the old squib of

powder and sulphur, or tar, is a nest can be taken any time during the day, and clean and short work made of it.—A. ALDERMAN, Effingham Hill, Dorking.

I SEE in this week's Journal a correspondent has been giving his experience with cyanide of potassium for the destruction of wasps and their nests. As he would like to hear the experience of others who have tried cyanide, I quite corroborate your correspondent's remarks. I have repeatedly tried cyanide of potassium (strength as much as 90 per cent. of cyanide), and although I have poured as much as 6 ozs. of strong solution at a time down the holes of their nests, I have never yet succeeded in destroying a nest completely. The most efficacious remedy my gardener has found is gas tar poured down the holes, and this is a very cheap and certain destroyer of wasps and their nests.—J. R. G.

I NOTICE Mr. Broady (page 14) is not very much in favour of cyanide of potassium for destroying wasps, because it does not at the same time destroy the larvæ; but he would himself confer a boon on the fruit-growing community by suggesting some other chemical so easy of application that would destroy at the same time the adult wasp as well as the larvæ. The value of cyanide of potassium is found in the extreme convenience of its application, because no night journeys are demanded such as that occasioned by the use of gunpowder and sulphur squibs commonly adopted for their extermination. Anyone on a wasp-destroying expedition with the cyanide in a soluble state might, by carrying a spade, dig out the nests on the return journey after an application of the liquid an hour or two previous.

Mr. Broady says, "When the nest is close to the entrance, which very often happens, it kills a portion only of those inside, whilst the rest are merely held prisoners until the fumes of the cyanide have evaporated, when the wasps pass in and out as usual." This experience certainly does not coincide with that I have gained by observation; so long as the entrance is open they are not held prisoners, because of the presence of the deadly fluid placed for their destruction. In an hour or so after the cyanide has been poured in at the mouth of their nest I have noticed that not a wasp was seen to move inside or out; all would be quiet. Even should it not kill the larvee it certainly would be worth an extra journey to dig out the nest, and the expense and trouble in its application must be repaid.

It is well to have a store of Scott's wasp destroyer in hand, in anticipation of attacks on choice fruit; usually this is effectual in checking their depredations, but not always. Last year I knew of more than one case where this was used persistently with no good effect, while in other years wasps were careful to avoid fruit where it had been used. To be effectual it should be put on the first fruits they attack, and particularly so on Grapes. I am under the impression that the eyanide would be more effectual in a liquid than a dry state, and perhaps more economical. When kept in a corked bottle there is less loss of evaporation.

—W. STRUGNELL

I HAVE tried several plans for dealing with wasps' nests, but I have never found anything so convenient, and to my mind so safe as the cyanide, but Mr. Broady (page 13) is certainly right in some degree in his assertion that it only kills the wasps going in. I give it credit for more than this, it stupefies those in the hive. The vapour is, I believe, heavy and goes down into the nest. Let me tell of one nest I took some years ago. A friend told me he was bothered with a nest in the roof of his dining room bow window, could I take it? Well, I said I would try. I found that the wasps had three entrances under three different tiles. At each entrance I put a piece of linen well soaked in a strong solution of cyanide, and suggested lunch for myself. In the course of twenty minutes I repaired to the roof. There was a stillness, and I removed one tile, this brought me on the edge of the nest, and all was still yet, so we removed some six or seven tiles and then the nest in all its beauty was revealed, and beautiful it truly was, clean as if carved out of some yellow veined marble, there it lay about 2 foot in length and 1 in breadth, and from 6 to 10 inches in thickness. Still no sign of life; so I placed the spade flat on the roof between two rafters, and pushing it as far as I could lifted the major portion bodily down on the spade and deposited it in a foot tub filled with water. The smaller divisions were removed in the same way. Neither the lookers-on or I were stung, but the stable boy playing with the pieces of comb soon after managed to squeeze a half dead wasp and was rewarded for his inquisitive attentions.

The vapour certainly does not affect the pupe covered in, and as numbers of these are hatching daily, the nest will very soon become lively again; indeed, I have frequently after digging out the nest placed it under a bell-glass, just lifting the bottom, and they soon begin enlarging the nest and increasing in numbers, but if the queen have succumbed to the poison the nest must, I suspect, come to an end in a few weeks, when all the pupe in the nest have hatched. Wherever it is possible to dig out and break up the nest I think this should be done, and I think it may be done safely in a quarter of an hour or so after placing the cyanide at all the entrances to the nest.

How long are the working wasps absent from the nest? This is a question somewhat difficult of solution, but judging from my experience with the cyanide in taking nests, I should say that in fine weather it would be exceptional for them to be away twenty minutes. I recollect many years ago my old friend Mr. W. Taylor, then at Longleat, narrated

in your columns his plan for destroying the outsiders; this was to bury a bottle in the old nest, the entrance to the nest being the mouth of the bottle, containing some syrup.

Applying cyanide and nothing else being done may be disappointing, as Mr. Broady seems to feel, but complete the business, dig out the nest, and cyanide is our most useful and most manageable help, at least that is my experience.—Y. B. A. Z.

MESSRS. W. PAUL & SON'S ROSES.

MESSRS. WILLIAM PAUL & SON request us to state with reference to the notice at page 8 of the *Journal of Horticulture* of their exhibit of Roses at the Show at Earl's Court on June 28th last, that a gold medal (instead of a silver-gilt medal as mentioned) was awarded to the exhibit in question.

Rose Margaret Dickson.

WHAT your interesting contributor, "W. R. Raillem," has said in recent numbers of the Journal of this beautiful Irish Rose is perfectly true. When half blown I find it exceedingly impressive, surpassing in purity of colour and majesty of aspect Merveille de Lyon. But at that picturesque stage of its development it indicates a central fulness which is not subsequently adequately sustained. In other words, when fully expanded, it discloses an "eye," though by no means so conspicuously as some other equally famous varieties, such for example as the Baroness Rothschild from which it is descended. — DAVID R. WILLIAMSON.

AN OLD MAN'S VIEWS.

If the Rev. David Williamson desires to be an authority on Roses he would surely do well to be less flattering in his references to individuals and look more carefully into the subjects on which he writes. He will doubtless learn in time what most experienced rosarians know, that it is not prudent to dogmatise on the merits of Roses or anything else on the mere authority of their raisers. I have heard it said that Mr. Williamson cannot have studied the new catalogue of the N.R.S. as an official guide; and it is also a matter of comment that he does not appear to appreciate the cardinal difference between the raiser and the introducer of a Rose, since he praises both alike, except when he confounds them. Something more than a generous heart is needed to fit a person to write with general acceptability on the subject of the Rose. As one of the oldest contributors to the Journal of Horticulture I feel I shall be doing a kindness to young, talented, and well meaning writers if I can induce them to temper their zeal in extolling their friends. The temptation may be great at times, and "sweet are the uses of advertisement."—A Jubilee Rose-Grower.

BRIERS OR BRIARS.

I see that a contemporary, which is not often wrong in spelling, and was able lately to defend the word "Chesnuts" learnedly against an impugner, speaks of Lord Penzance's hybrids as "Sweet-Briers." "Briars" is certainly the commonest form of spelling to which we are accustomed; but probably, as in so many other cases, either mode can be defended. However, I remember an amusing incident as to the spelling of this word, where "a" or "e" was not the question. It was at the examination of a night school for the Government grant, and the teachers were allowed to examine subject to the rules sent to them. A young East Anglian labourer was going through the reading ordeal, and his teachers, of whom I was one, were anxiously watching his struggles. He had sunk twice—I mean he had made two mistakes in his allotted piece, and three would mean a failure. He came to the word in question, stopped dead, and spelt it slowly. We encouraged him, and patted him on the back, for he had all the appearance of having a word in him, but of being afraid to part with it. At last, after much exhortation to play the man and "out with it," he spelt it again very carefully, "B-r-i-a-r," and then the word burst forth quite suddenly like an explosion, "Brumble bush!" "Well, well! yes, oh yes! eh, Raillem?" said my dear old colleague (long since deceased) "pass that—oh yes! He knows what it means." My conscience was against it, my rosarian conscience, which knew that to the Suffolk rustic both Briars and Blackberries were "Brumble bushes." However, I said nothing, and the Education Department was defrauded, but rosarian taxpayers will, I hope, forgive.—W. R. RAILLEM.

ORANGE FUNGUS.

ALL rosarians, and the more modest Rose growers and lovers, must feet grateful to Mr. Abbey (page 481, June 15th) for his interesting article on this great pest. So far as my experience has gone, what I have called orange fungus is not very common. The beautiful orange spots have been with me comparatively rare, but the sort of powdery dull yellowish brown appearance of the under portion of the leaves has

been common enough towards the latter part of the season. Are we to understand that this, which certainly detracts from the beauty of the foliage and very decidedly from the healthy condition of the plant, is what Mr. Abbey has figured at D in fig. 87, and that it is the orange fungus in another stage? If so, it seems to me we are fortunate in not having the orange fungus much more frequently, because with me it seems a very common trouble. I have on the first sight of the orange spots picked off all I could see and burnt them, but with the later condition I have let matters take their course, and I certainly have

seen plenty of it in exhibition stands.

It has long been my plan, right or wrong, to cut off all shoots of Rose bushes that I should cut away in the following spring in the autumn. At the same time I have shortened very fine growing shoots to between 30 and 40 inches. This saves them in some degree from injury from wintry winds. In future all this, whether affected or not, I shall have burnt at once. If I take exception to any advice that Mr. Abbey gives, I desire to do it in all humility. I cannot think that "burying" the leaves can be a wise plan. Earth is a deodoriser certainly, but not a disinfectant, and I cannot help thinking that whenever that ground is dug, the spores must be set free to go on their evil deeds. fathers certainly had the notion that to bury was to destroy. in the present day many of their sowings, to our misery and cost. Fire is, after all, the great purifyer, the great destroyer of germs, and in that alone, as to cut-off leaves and branches, should I have any faith.

—Y. B. A. Z.

A FEAST OF ROSES.

In marked contrast to last year, June has been virtually "a month of Roses." Roses in abundance have shed infinite variety and beauty on our fairest garden scenes. Noisette Roses on overhanging arches have been studded from base to summit with clusters of pink and white miniature Roses; also in groups and beds with their numerous flowers and tiny buds, affording a fitting contrast to the giants of other kinds. Teas of the tenderer class have revelled in the late tropical weather, and even Hybrid Perpetuals in open positions, have produced blooms of fine size, substance and form, but unfortunately, owing to the great heat, their beauty has been of short duration.

A better season for our national flower, could scarcely be wished for in all instances where water has been copiously given, but where this has not been done I have heard but poor accounts of the progress of Roses. One thorough soaking being followed up by mulching with short manure, has in many instances made a vast difference between the results obtained from bushes so treated and others not given this necessary attention, for as soon as a Rose tree begins to suffer from want of rich food or water it becomes a prey to aphis, mildew, and caterpillars. It is then but small wonder that such meagre results are obtained. This, however, is a point which I do not intend to enter largely upon at present, but rather to point out a few of the peculiarities exhibited by some

varieties during a season like the present one.

Those who pruned early have this year been rewarded with decidedly the best blooms, especially among Hybrid Perpetuals. Bushes or standards left unpruned till the usual time were much weakened by having to cut away a large amount of young growth. I pruned some bushes during the first week in March, and have cut some of our finest blooms of the season from them, the growth made having been wonderfully strong and healthy. La France has given us some beautiful blooms of the fine rounded form for which this variety is noted when in good condition. Countess of Oxford, Victor Verdier, Marie Baumann, John Stuart Mill, Mrs. J. Laing, Madame Nachury, Madame Gab. Luizet, and Captain Christy have all succeeded remarkably well, but that generally fine variety Merveille de Lyon has not been nearly so good as usual; the petais seem to lack substance and to be entirely unable to withstand hot sunshine when accompanied by a parched atmosphere. Duchess of Bedford, Jules Margottin, and Baroness Rothschild also seem to delight in tropical weather, the latter variety being so quickly spoilt by rain; indeed pink or white Roses are generally

injured more quickly by rain than darker coloured kinds.

Excellent as the Hybrid Perpetuals have been, the Teas have done still better with us this season. In a warm sunny position, when they received abundance of water, the trees have made strong healthy growth kept quite free of insects, and produced many grand blooms. Even that handsome variety Jean Ducher, which generally produces large promising buds, but unfortunately fails to open them properly by reason of the petals being so quickly injured by rain or dew, has this season developed fine blooms. Bougère is another wonderfully free flowering kind which has given a multitude of blooms. Ernest Metz in my opinion is one of the most beautiful coloured Teas grown, the blooms being of fine form and soft colour, and Grace Darling, though by no means large, is unique in appearance by reason of the peach-coloured shade which predominates in the flowers. Madame de Watteville has, as yet, given but few blooms, the severe frost of the last two winters having killed much of the wood. I look forward, however, to having a large number of blooms later on. Madame H. Jamain and Innocente Pirola, though not remarkable for the amount of growth made, have given an unusual number of blooms. This is perhaps accounted for by the fact that they were less severely pruned than most other varieties on account of having made a large amount of growth early.

Princess of Wales is the dwarfest growing Tea we have, but it

flowers very freely, and is particularly attractive in the bud. Goubault, Souvenir d'un Ami, and Catherine Mermet have opened their flowers without the slightest blemish being apparent in their delicate petals. Rubens is a variety which does not appear to me to be sufficiently well

known. It is simply perfect in the bud, being white delicately tinted rose, and of fine conical form. The Bride has this year proved to be quite worthy of its name, having produced blooms which stood peerless among a wealth of Roses.—H. DUNKIN.

PINKS AT HANDSWORTH.

I HAVE for two or three years past sent you some notes on exhibition laced Pinks in the collection grown by Mr. Arthur R. Brown of the Crompton Road, Handsworth, Birmingham, a collection famous in the Midlands for its inclusion of the newest as well as the best oldest varieties, and for excellent cultivation. Mr. Brown's father was a wellknown and greatly esteemed old florist, and always made Pinks a favourite flower. He was the raiser of Mrs. Dark, Ethel, and that finest of all the laced Pinks, Amy; and this flower, with the Carnation and Picotee, finds a thoughtful and excellent cultivator in the son. The extreme heat of the early and middle part of June brought Pinks rapidly into bloom, and when the flowers were not shaded the colour of the lacing was destroyed to a great extent. Mr. Brown had his plants growing under a structure like that used for Tulips, with a canvas shading, but with plenty of air. It was difficult to preserve them in good character for any length of time in such tropical weather.

Campbell's Extra is dark purple lacing, a refined flower with fine petal this year. Last year it generally came heavy and not so good. This season's blooming shows it to be a desirable variety. Brown's Amy is a grand Pink, and the finest in cultivation. A large flower of perfect form, with broad smooth petal, and a heavy lacing of dark maroon, a variety that should be in every collection. Fellowes' Pandora, light red or rose laced, is a large back row flower, but lacking refinement and form. Campbell's Nothing Better is a most refined flower, dark purple laced, and an evident acquisition, but as yet very scarce. Paul's Chastity has a fine petal, the bloom is small but of good quality, and with bright rose lacing. Paul's Emeline is a dark purple laced flower of first-rate quality, and will be sought after by growers. Brown's Ethel is a large full flower with good petal and fine form, with narrow reddish purple lacing, and an acquisition. Turner's Berard is an old well known and still fine variety of large size, and a good exhibition flower, with dark red lacing. Hooper's Mrs. Fred Hooper, clear rose laced, is a very fine flower, with large petal, and stands in the foremost rank of fine varieties. Paul's Bertha is a grand flower with a fine petal, with dark reddish purple lacing. Fellowes' Lorina is a large flower, bright in colour, dark red lacing, but faulty in petal and form. Turner's Godfrey is an old variety still worth growing with reddish purple lacing and a reliable exhibition but faulty in petal and form. Turner's Godfrey is an old variety still worth growing, with reddish purple lacing, and a reliable exhibition flower. Fellowes' Hebe is very heavy in colour and rough; large, but wanting in refinement. Douglas' Empress of India is a beautiful flower, with an excellent petal and rich bright dark lacing. It has only one fault—thinness; and another row of petals would make it a very first-class flower, but as it is it is a most desirable variety. Fellowes' Minerva is a fine flower with dark red lacing, and an improvement on Turner's Bertram, and is a fine heavy laced flower. Hooper's Ne Plus Ultra at Handsworth is identical with Boiard, or at all events, so like it that a distinctness cannot be seen. it that a distinctness cannot be seen.

Paul's William Paul, with clear rose lacing, is a very fine variety, but such a bad doer, else it would be valuable. Paul's Ada Louise, rosy purple lacing, is bright in colour, but rough in form as grown here. Turner's Dr. Maclean, rosy purple lacing, is a fine flower, but a bad grower. Rosy Morn, heavy rose laced, has a fine petal, and is one of the best of Mr. Fellowes' raising. Hooper's Harry Hooper, a first-class very fine full flower with broad petal, and rich and bright reddish-purple lacing. Hooper's Emerald, red lacing, is like Ada Louise, and is rather rough. Brown's Mrs. Dark, an old flower now, is still a useful one and a good grower. Paul's Tottic, a small but chaste flower, with good petal and bright red lacing. Love's John Love for the future is to be rejected, as "Modesty" is so much finer. Paxford's Ne Plus Ultra, an Love's John Love for the future is to be Oxford raised flower with dark red lacing, is very pure in the white, Paul's Modesty is always a first-class flower, and should be but coarse. in every collection, however small, and with light reddish-purple lacing. Maclean's John Ball is still a good old flower, with dark rich purple Arthur Brown is the name given to a very fine seedling raised by Mr. George Chaundy of Oxford, a coming flower with bright medium rosy-purple lacing, the white pure, and with a fine well-formed petal. This flower must be described as extra fine. Fellowes' Princess Louise last year I described as almost a good flower; this year it is good, with a broad petal and of fine form, and with red lacing. Fellowes' Bessie is a very large flower, reddish-purple lacing, but rough. Fellowes' Olympia, red laced, large but rough. Fellowes' Lustre, reddish-purple lacing, is large, but with a small petal. Fellowes' Ophelia, reddish-purple lacing, was rough last year, but a little better this year, but still Taylor's Alderman Thorp, dark red lacing, and Taylor's Samuel rough. Barlow are both thin but with good petals, and too small for midland growers.

Croak's Noble Grand is dark red laced, and has a fine petal, but is so thin. Croak's Mrs. J. Croak is a very useful telling flower, and if smoother on the edge would be in every way a first-rate flower. Fellowes' Jeannette is one of his best, and must be regarded as a fine back row flower with bright purple lacing. Fellowes' The Rector is a grand variety, the best he has sent out and first-elass in every way, with purple lacing. Fellowes' Captain Kennedy, reddish purple lacing, a newer and very fine flower of good form, fine petal, and bright colour. Fellowes' Maggie, rosy purple lacing, full of petals and a flower of fair quality as reen here, but it has not the fine petal and quality of The Rector. Fellowes' Melanee, new, small in petal, still a pretty and full flower of medium quality and with bright red lacing. Fellowes' Enchantress, new, is a very profiled to the contract of the this variety is not fairly tested here this season. Paul's Undine is rose laced, pretty but small. Fellowes' Favourite is new, a promising flower of "Rector" colour, but with small petal and with reddish purple lacing. This must have another season's trial, as the plants were small, but it is a variety evidently worth growing. (Since writing these notes another bloom has opened, and it is evidently a very fine Pink, and the best Mr. Fellowes has raised excepting The Rector.) Hooper's James Douglas and Douglas's John Drake were not in good character; and Campbell's Sancho had not bloomed, so I am unable to send notes of these, also of Mr. Thurston's new varieties.

Border Pinks are also grown here, and side by side were Mrs. Sinkins, Her Majesty, and Mrs. Lakin, all white varieties, the latter being the best, and with a better pod than the others. Hooper's Mrs. Barlow has a pale rose pink ground colour, with pale purple lacing, of good form, and is a very pretty border variety.—W. DEAN.

ROYAL HORTICULTURAL SOCIETY.

JULY 11TH.

CHISWICK LOCAL SHOW.

An Exhibition of fruit, flowers, and vegetables was held in the Gardens of the Royal Horticultural Society at Chiswick on the above date, and from an horticultural point of view it was a success. Flowers and plants were well shown, but fruit was not, in the competitive classes, so well represented as might have been expected. Several exhibits were brought to the notice of the various Committees, and these are referred to in their respective places. The annual Exhibition of the National Carnation and Picotee Society (Southern Section) was held at the same time and place, and a report of the Show will be found elsewhere in this issue. There was but a moderate attendance at the Exhibition in the afternoon, although fine weather prevailed.

FRUIT COMMITTEE.—Phillip Crowley, Esq. (in the chair); Messrs. 3. T. Wright, J. Cheal, W. Bates, F. Q. Lane, Geo. Wythes, G. Taber, W. Warren, T. F. Rivers, P. C. Veitch, G. Reynolds, Harrison Weir, H. Balderson, G. H. Sage, W. H. Divers, A. Dean, and J. Willard. Messrs. Jas. Veitch & Sons, Royal Exotic Nurseries, Chelsea, staged a

magnificent collection of Gooseberries, comprising many of the leading varieties in cultivation. Noticeable amongst others were Hebron Prolific, small, fine flavour; Jays Wing, Rumbullion, Warrington, Whitesmith, Green Laurel, Ironmonger, Gipsy Queen, Keen's Seedling, Yellow Champagne, very fine flavour, one of the most distinct and best. A silver-gilt Knightian medal was recommended for this collection. Apples, Cherries, Currants, and Raspberries were also shown by the same firm. The Red Currants were particularly fine, La Versaillaise being the finest so far as size of berry may be taken as a criterion. Mr. J. Hudson, Gunnersbury House Gardens, was awarded a cultural commendation for six bunches of Black Hamburgh Grapes, which had been cut from a Vine growing in a 12-inch pot. The combined weight of the six bunches was 9 lbs. 6 ozs.

Mr. J. Douglas, Great Gearies, Ilford, staged a fine bunch of his seedling white Grape, the result of a cross between Black Hamburgh and White Muscadine. Messrs. Hurst & Son, Houndsditch, staged a basket of Tomato Dunedin Favourite. The fruits were very shapely and of a rich deep red colour. Mr. Owen Thomas, Royal Gardens, Windson showed seedling Malons in fine condition. The same exhibitor Windsor, showed seedling Melons in fine condition. The same exhibitor also staged fruits of Walburton Admirable Peach, for which he was accorded a cultural commendation. Messrs. Thomas Rivers & Son, Sawbridgeworth, staged a grand collection of fruit, including Peaches, Nectarines, and Plums, for which a silver Knightian medal was recommended. Peaches Princess of Wales and a seedling were very fine, also were Early Rivers and Hale's Early, which had been grown in a cold house. A box of Early Rivers Nectarine was also striking. Early Rivers, Emperor Francis, White Bigarreau, Bedford Prolific, and Bigarreau Monstreuse de Mezel were amongst the best of the Cherries, and Grand Duke, Victoria, and Monarch of the Plums.

Mr. Miller, gardener to Lord Foley, Ruxley Lodge, Esher, staged a collection of Peaches and Nectarines, for which a cultural commendation was accorded. Mr. Miller also staged a dish of Ponderosa Tomatoes. Mr. Leach, Albury Park Gardens, showed Peaches, Grapes, and fruiting branches of Plums and Damsons. A vote of thanks was accorded. Messrs. Robert Veitch & Son, Exeter, staged a dish of Lotus tetragololobus (Asparagus Pea), for which they were accorded a vote of thanks. Mr. Payne staged a creditable collection of Tomatoes. Mr. Thos. Kerridge, Norwood Lodge, Southall, showed a fine plant of a seedling Tomato Norwood Lodge.

FLORAL COMMITTEE.—Present: W. Marshall, Esq. (in the chair), Messrs. Jas. Walker, George Stevens, W. C. Leach, Chas. E. Shea, Thos. Godfrey, R. B. Lowe, J. H. Fitt, Chas. Noble, Chas. Jeffries, Robert

Owen, and Frank Ross.

Messrs. Sutton & Sons, Reading, had a beautiful display of their specialtics, these including a fine strain of bedding Stocks, Achimenes longiflora and Rosy Queen, also some splendid Begonias, described as being six months from the seed-sowing stage. They were large, bealthy plants full of bloom. Semperflorens compacts roses; S. Coral Gem, a charming variety, with soft blush pink flowers; Duchess of York, bright rose; Duchess of Edinburgh, white, with broad rose

margin; Crimson Gem and Reading Snowflake, white. A silver-gilt Flora medal was deservedly recommended. A large and beautiful collection of Ferns and foliage plants was sent by Mr. H. B. May. The plants were in beautiful condition and most tastefully arranged; indeed, the group was one of the best Mr. May has put together. A silver-gilt medal was recommended.

Messrs. B. S. Williams & Son had a beautiful mixed group of Orchids and other plants, these including Brassavola Digbyana, Cypripedium superbiens, Demidoff's variety, Ochna multiflora, Epidendrum nemorale, and many others (silver Flora medal). Messrs. Hugh Low, Clapton, sent a new Lilium named L. Lowi, for which a first-class certificate was awarded. This is referred to elsewhere. Messrs. J. Laing & Sons, Forest Hill, sent some Begonias and other plants, obtaining awards of merit for Dracæna indivisa aurea variegata and Caladium Baronne de Maimore. Mr. Anthony Waterer, Knaphill, sent plants of Spiræa "Anthony Waterer," and Mrs. Blake, Croydon (gardener, Mr. Lewrey), a basket of Lewrey's Beauty Lobelia. Messrs. Wallace & Co., Colchester, sent plants of a new Lily, named Lilium Alexandræ provisionally, for which a first-class certificate was awarded.

Messrs. J. Veitch & Sons sent apparently the same Lilium under the name of L. Ukeyuri, and a first-class certificate was awarded. Messrs. Veitch also secured a botanical certificate for Ferraria antherosa, and they had Begonia decora, Strobilanthes Dyeriana, and other plants. Mons. Lemoine, Nancy, sent a number of fibrous-rooted Begonias, the best of them being B. Sieberiana, Illustration, and Bajocensis. J. Sallier sent a variegated Nicotiana which is described elsewhere (award of merit). Messrs. H. Cannell & Sons, Swanley, had a group of Tuberous Begonias, the plants having been grown from seed sown last February. They were well in flower, and attracted much attention. Messrs. Chas. Lee & Son, Hammersmith, arranged an effective group of hardy ornamental shrubs, for which a silver-gilt Flora medal was

ORCHID COMMITTEE.—Present: H. J. Veitch, Esq. (in the chair); J. O'Brien, E. Hill, Chas. Pilcher, and Dr. Masters.

Orchids were not shown very extensively. Messrs. Hugh Low & Co., Clapton, sent a small group, amongst which Cattleya Harrisone, C. Eldorado splendens, C. gigas, Cypripedium Schroderæ, and the beautiful Stanhopea Amesiana were conspicuous. Messrs. F. Sander & Co., St. Albans, sent a small collection of choice Orchids. Amongst these were Cypripedium Massaianum (award of merit), Anguloa Clowesi, Cattleya granulosa, and C. Gaskelliana, Cook's variety. T. Statter, Esq., Stand Hall, Manchester (gardener, Mr. R. Johnson), sent a plant of Cypripedium Stonei Cannartæ, for which an award of merit was given. This is described below. Mr. Statter also sent blooms of other Orchids, and Mr. W. C. Clark, Orleans House, Sefton Park, Liverpool, sent a spike of Cattleya Rex. Messrs. W. Lewis & Co., Southgate, had a plant of Cattleya Gaskelliana var. Southgatense.

CERTIFICATES AND AWARDS OF MERIT.

Alstræmeria aurantiaca (G. H. Cannell, Esq.).—This is a well known hardy plant, the orange red flowers being most attractive (award of merit).

Caladium Baronne de Maimore (J. Laing & Sons).-An attractive variety with medium sized leaves of a light colour and prominent red

veins (award of merit).

Cypripedium Massaianum (F. Sander & Co.).—This is the result of a cross between C. superciliare and C. Rothschildianum. The plant shown bore two flowers on one scape. The blooms show the parentage of C. Rothschildianum in the petals. The lip is dark brown (award of merit).

Cypripedium Stonei Cannarte (T. Statter, Esq.).—This is a fine form of C. Stonei. The dorsal sepal is broad, light coloured, veined brown; the petals being long, narrow, and of the character of the type. The lip is light purplish brown and yellow (award of merit).

Dracæna indivisa aurea variegata (J. Laing & Son).—A decorative plant with greenish yellow stripes in the centre of each leaf (award of

Lilium Alexandra × (Wallace & Co.).—This is a new Lily, and was certificated subject to its being correctly named by Mr. Baker, who on a cursory examination, we are informed, considers it to be a garden hybrid. It is a grand kind from Japan. It is apparently a dwarf form, the plants exhibited being less than 18 inches in height and each bearing three flowers. The blooms are very large and pure white (firstclass certificate).

Lilium Lowi (H. Low & Co.).—This is a tall-growing Lilium, the plant (which was in a 5-inch pot) shown being upwards of 3 feet in height. The flowers are medium size, white, the throat being densely

spotted with crimson (first-class certificate).

Lilium Ukeyuri (J. Veitch & Sons).—This is apparently the same
Lilium as was shown by Messrs. Wallace & Co., and which is described above (first-class certificate).

Nicotiana colossea variegata (J. Sallier, Paris).—This is a variegated form with large leaves. The variegation consists of a creamy margin and light coloured ribs (award of merit).

COMPETITIVE CLASSES.

The competitive classes were fairly well filled, and in most instances the exhibits were of a good quality. Mr. Porteous, gardener to E. H. Watts, Esq., Devonhurst, Chiswick, exhibited some large and fine Ferns, very healthy and fresh. In the class for nine hardy sorts, Mr.

Waite, gardener to Colonel Talbot, Esher, was first with some large specimens. A. Russell, Esq., Woodlands, Isleworth, had some well coloured Fuchsias in the class for six. and was placed first. Mr. J. Ford, gardener to Sir C. Pigott, Wrexham Park, Slough, was first for twelve Tuberous Begonias. They were splendid plants, being large, clean, and well furnished with fine flowers. It is not often that such admirable quality is met with in Begonias at an Exhibition. Mr. Ford had arranged his plants with Ferns and Caladiums, so that their effect was enhanced. Mr. W. H. Davis, gardener to T. E. Hodgson, Esq., Ranelagh House, Grove Park, was placed first for twelve trusses of Zonals; they were a little thin, but still far superior to those of Mr. Hoar, gardener to T. J. Cooper, Esq., The Grange, West Molesey. Mr. Porteous won with twelve bunches of stove and greenhouse flowers, his Orchids being excellent. Mr. Aspland, gardener to Dr. Tuke, Chiswick House, was second; Mr. Davis third, and Mr. Hoar fourth. Mr. Sage, gardener to Earl Dysart, Ham House, Richmond, won with hardy flowers, Mr. Aspland being second. Miss Debenham was first with eight bunches, Mr. Hudson, Gunnersbury House, Acton, following. Mr. W. H. Davis had some excellent Gloxinias, and was placed first for them; while Mr. Jones, gardener to E. Hyde, Esq., had some grand plants not for competition.

In the class for twenty-four Roses, distinct, Messrs. Harkness & Son, Bedale, were awarded the first prize, showing some very fine blooms, amongst the best of which were Gustave Piganeau, Horace Vernet, Reynolds Hole, Madame Hausman, and Fisher Holmes. Mr. G. Mount, Canterbury, was second with a very creditable stand; and Mr. B. R. Cant, Colchester, third. There were four competitors in this class. Messrs. Harkness & Son were again accorded the first prize, a silver cup, for twenty-four Roses, distinct. three trusses of each, staging Duke of Wellington, Duke of Connaught, Etienne Levct, A. K. Williams, Alfred Colomb, Dupuy Jamain, Exposition de Brie, and Madame John Laing in excellent form. Mr. B. R. Cant was second with a fine stand, and Mr. Frank Cant, Colchester, third. Six competitors. John Bateman, Esq., Rose Vale, Archway Road, N., gained the second prize in the class for twelve distinct Roses. There were only two competitors the second being the only prize a warded

petitors, the second being the only prize awarded.

For a group of plants arranged for effect, Messrs. W. Fromow and Sons, Sutton Court Nurseries, Chiswick, were awarded the first prize. This group was tastefully arranged, comprising Palms, Crotons, Ferns, Liliums, Orchids, Begonias, and Caladiums. Mr. Porteus, gardener to E. H. Watts, Esq., was first for another group well arranged, Dr. Tuke being second in this class. Both exhibits were attractive and well arranged. Mr. C. Turner, Royal Nursery, Slough, was awarded first prize for a group of Pelargoniums, showing well flowered plants. Miss Lilian Hudson, Gunnersbury House, Acton, W., secured the leading prizes for a stand of flowers. The floral classes for amateurs were fairly well contested, and the exhibits in many cases were very creditable to their growers, the window box for which Mr. J. Gale, Chiswick, was accorded the first prize, being particularly noticeable. Vegetables were also staged in fine condition in the cottagers' classes, the collection of Mr. A. Farmer, Gunnersbury, being remarkably good for the season.

Fruit was not so extensively shown. For two bunches of black Grapes Mr. T. Osman, The Gardens, Ottershaw Park, was first, showing Black Hamburgh in good condition. Mr. C. J. Waite, gardener to Col. the Hon. W. P. Talbot, was second, there being no other competitor. There were four exhibitors of two bunches of white Grapes. Mr. Osman was again first with well-grown Mrs. Pearson; Mr. C. Payne, gardener to W. A. South, Esq., Neasdon House, Neasdon, being second with Muscat of Alexandria. E. H. Watts, Esq., Devonhurst, Chiswick, was third. Mr. W. H. Divers, gardener to J. T. Hopwood, Esq., Ketton Hall, Stamford, was the only exhibitor of Strawberries, and the first prize was awarded for a fine dish of British Queen. Mr. C. J. Waite was first with a dish of Nectarines, showing Stanwick Elruge in fine condition. Mr. J. Ford, gardener to Sir C. Pigott, Bart., Wrexham Park, Slough, was second with the same variety; and Mr. G. H. Sage, gardener to Earl Dysart, Ham House, third with Victoria. Of Peaches there were four exhibitors, Mr. J. Debnam, gardener to A. Pears, Esq., Spring Grove House, Isleworth, being first with splendidly coloured Violette Hâtive. Mr. J. Ford was second with Barrington, and Mr. Waite third with Royal George, well coloured.

Mr. C. J. Waite, gardener to Colonel the Hon. W. P. Talbot, Glenhurst, Esher, was accorded Messrs. J. Carter & Co.'s special prize for six dishes of vegetables, showing Carter's Ashtop Fluke Potato, Green Globe Artichoke, Carter's Perfection Tomato, Holborn Onion, Summer Favourite Carrot, and Telegraph Pea, all in very good condition. Mr. C. Payne, gardener to W. A. South, Esq., Neasden House, Neasden, being second, and A. Russell, Esq., Woodlands, Isleworth, third. Mr. H. Balderson, Corner Hall, Hemel Hempstead, secured the leading prize offered by Messrs. C. Sharpe & Co., Sleaford, for three dishes of Peas, showing Sharpe's Queen, Triumph, and Sir F. A. Millbank in fair condition. Mr. G. J. Waite was second, and Mr. T. Watkins, Grove House, Merrow, third. Mr. Waite gained first prizes for three dishes of Potatoes, showing Reading Giant, Sutton's Seedling, and Carter's Ashtop Fluke. Mr. Farmer, Railway Cottages, Blenheim Road, Gunnersbury, was second, and Mr. G. H. Sage third. Tomatoes were grandly shown by Mr. Sage, who had Conference, Sutton's Al, and Perfection. Mr. C. Payne was second. Mr. W. H. Davies, gardener to T. E. H. Hodgson, Esq., Ranelagh House, Grove Park, was first with a brace of Cucumbers, showing Sutton's Peerless. Dr. Tuke, Chiswick House, was second.

EVENTS OF THE WEEK.—Events of horticultural interest are not particularly numerous during the ensuing week. To-day (Thursday) the provincial Show of the National Rose Society will be held at Worksop, and the Woodbridge (Suffolk) Exhibition takes place. Several Rose shows will take place in various parts of the country, and a list of these will be found in our last issue.

— THE WEATHER IN LONDON.—After a few days of abnormal heat heavy thunder showers occurred at the end of last week. Rain fell heavily on Saturday afternoon, and in some parts of the metropolis much damage was done by the lightning. On Sunday, Monday and Tuesday occasional showers also occurred, these refreshing vegetation considerably. Wednesday opened showery, and at the time of going to press the weather appears unsettled.

—— ROYAL WEDDING DECORATIONS.—Mr. J. W. Wimsett, Ashburnham Park Nursery, King's Road, Chelsea, requests us to state that his firm supplied half of the floral decorations for the Royal wedding, the remainder, as stated on page 10 in our last issue, being done by Messrs. Wills & Segar.

THE TRENTHAM SHOW.—We are informed that the Exhibition to be held in the grounds of the Duke of Sutherland on the 20th inst. is expected to be of a very interesting and comprehensive nature. The schedule is an excellent one, and prizes good. Gardeners are expected from various parts of the country. All the "best people" from the surrounding neighbourhood visit the Trentham shows, and the company generally has always been very large indeed.

FROZEN CHRYSANTHEMUM BLOOMS.—Chrysanthemum growers will be interested to learn a special meeting of the General Committee, and also of the Floral Committee of the National Chrysanthemum Society, will take place at the Royal Aquarium, Westminster, on Friday, July 21st, at six o'clock in the evening, to examine the frozen blooms of Chrysanthemums sent from Sydney, Australia. Members of the Society not being members of the General or Floral Committees are invited to attend at seven o'clock to inspect the frozen blooms.

—— SHRUBS AND TREES BURNT AT THE ALEXANDRA PALACE.—
On Saturday, July 1st, the shrubbery and trees immediately in front of the Alexandra Palace, Wood Green, N., through some unexplained cause, became ignited, and the fire spread with such alarming rapidity that in a very short time several acres were ablaze. The local steamers, in addition to the Palace hydrants, were quickly at work, but the fire was not got under for some hours. The conflagration covered an area of ten acres, and considerable damage was done to shrubs and trees.

Some Fine Oats.—In reference to your leader in last week's issue respecting the effect of the drought, I send you herewith a sample of Oats growing on 10 acres of nursery land. We have had only one night's rain since the first week in March. The days are too short to count the number of corns to each head, but I estimate the yield at at least 10 quarters to the acre. The Oats are 5 feet high. The curious part of the whole matter is that most landowners charge extra rent for land used for nurseries, because they say nurserymen spoil the land.

—A. H. Pearson, Chilwell Nursery. [Good nurserymen improve it by deep cultivation. The Oats were splendid.]

— United Horticultural Benefit and Provident Society.— The quarterly meeting of this Society was held on Monday evening last at the Caledonian Hotel. Mr. Nathan Cole occupied the chair. Three new members were elected, making thirty-five in the six months. The death of a non-paying member occurred in May last, and the amount standing to his credit (£24 7s. 4d.) was paid to his widow. The late member ceased to contribute in 1886. One member only is on the Sick Fund at the present time, thus showing the health of the members to be good. The Treasurer reported having invested £200 in West Bromwich 3 per cent. stock since the last meeting. The usual vote of thanks to the Chairman terminated the proceedings.

- Wakefield Paxton Society.—At the usual meeting of the members of this Society last week an excellent essay on "Summer Salads" was read by Mr. W. Hudson, The Lodge, Sandal Grange The paper contained several excellent suggestions and some valuable advice.
- THE MIDLAND CARNATION AND PICOTEE SOCIETY.—We are requested to state that, owing to the earliness of the season, the date of this Exhibition, which will be held in the Botanical Gardens, Edgbaston, has been fixed for Saturday, July 22nd, instead of August 5th as in the original schedule.
- JOHNSON'S GARDENERS' DICTIONARY.—The fifth part of the new edition of this standard work has come to hand. It deals with the genera from Inga to Agaricus campestris (Mushroom), inclusive, full cultural details of the latter being given. As we have before remarked, the edition will be completed in eight parts.
- GARDENING APPOINTMENT.—Mr. Thomas Winkworth, who for the past eighteen years has been gardener to Ralph Brocklebank, Esq., Childwall Hall, Liverpool, has been appointed gardener to that gentleman's eldest son (of the same name), who is leaving Childwall, having purchased Haughton Hall estate, near Tarporley, Cheshire.
- Were a plant of it amongst some Rhododendrons which has thrown up its flower spikes 8 feet high, where it has an imposing effect, the foliage of the evergreens below making a pleasing setting to its pale yellow flowers. The plant in question has been established half a dozon years. The strong soil in which it is growing appears to suit it well. Where a suitable site can be found this is just the plant to grow for the borders or shrubberies."
- VIOLAS WHITE DUCHESS AND COUNTESS OF WHARNCLIFFE. —The first is a new Viola of merit. Its colour is white, distinctly edged with blue. That it will become a favourite with Viola cultivators I cannot doubt. It was raised by Mr. Baxter of Daldowie. Passing to the Countess of Wharncliffe, it is to my mind the chastest, sweetest, and most fragrant of pure white Violas. Its colour is exquisite, resembling that of white satin. Let any of the readers of this Journal who cultivate the Viola compare the Countess of Wharncliffe with Countess of Hopetoun, and they find that the difference is very discernible. Another of my most precious floral possessions is Dr. Stuart's miniature Viola, entitled "Violetta," which may be described in the language of Thomas Gray, as "a gem of purest ray serene."—DAVID R. WILLIAMSON.
- PANSIES AT THE WORLD'S FAIR.—An American contemporary says:—The Pansy display at the World's Fair, Chicago, will no doubt soon lose some of its attractiveness from the continuation of excessively warm weather. The great beds in front of the horticultural building are daily admired by thousands. These Pansies, which represent the best strains of growers in England, France, and Germany, as well as in America, were sown in the open ground July 12th–18th last year. The locality chosen was one of the inner courts of the horticultural building, so, although in the open ground, they would be at least partially shaded at some times during the day. They received their first transplanting when about five weeks old, being given more room for the purpose of encouraging a more stocky growth. They were finally planted out in the autumn, and were all wintered outside. Some of them were covered with littery manure, while others were protected by temporary frames. The Pansies were very late in coming into bloom.
- FOREIGN FRUIT CROPS. Latest advices from Greece show that the downy mildew has attacked the Currant plants in Patras, Zante, and some of the other coast districts, and there is reason to fear that much damage will be done, although Currant growers in the east have learned to use the copper compounds for spraying against mildew. It is probable, says the "Garden and Forest," that in a few years Currants from California will be as common in our markets as other fruits are now, since the experiments in cultivating this berry there have proved most encouraging. Fruit dealers are looking forward confidently to the time when European Currants will be subject to competition with the California product, just as European Prunes and Raisins now are. The Prune crop of Bosnia and Servia is likely to be up to the average, and the crop of French Prunes will be abundant and good. Encouraging reports come from Spain as to the crop of Valencia Raisins, and a careful review of the situation in the "Journal of Commerce" concludes that there is likely to be an abundance of fruit from all sections of the world with low prices.

- —— DEATH OF MR. ROBERT HOLLAND.—We regret to hear of the sudden death recently, from heart disease, of Mr. Robert Holland of Frodsham, Cheshire, a well known authority on agriculture, and the joint author, with Mr. James Britten, F.L.S., of the Natural History Museum, South Kensington, of the "Dictionary of English Plant Names."
- —— SUMMER MARGUERITES.—These are beautiful flowers when blooming superbly in huge masses. At the same place as I saw these there are Helenium pumilum, clear yellow, 15 inches in height; Erigeron speciosus superbus, large flat bluish mauve flowers; and Chrysanthemum maximum, white, the fine dwarf form of the Ox-eye Daisy. Later in the season this latter is well replaced by Chrysanthemums lacustre and uliginosum; the Helenium by various single Helianthuses and Harpaliums; and the Erigeron by some of the finer forms of the Michaelmas Daisy.—A. D.
- DEATH OF MR. JOHN FIELDEN.—We learn with extreme regret of the death of Mr. John Fieldeu, of Grimston Park, Tadcaster. He was, we believe, about seventy years of age, and had been in a weak state of health for a considerable time. He was buried on Friday last in the pretty churchyard adjoining the fine old parish church of Kirkby Wharfe, mourned deeply by a wide circle of friends, and by those who had served him. A more kind, considerate, and when merit deserved, a more appreciative employer did not exist. He took an interest in everyone on his place, and showered benefits upon those who had won his confidence. It is considered probable that the magnificent estate will remain in the Fielden family.
- —— SWAINSONIA GALEGÆFOLIA ALBA.—The finest specimen of this greenhouse plant that I have seen is growing against the back wall in Mr. Agate's Chrysanthemum house in Havant. The space covered is 15 feet by 7 feet, and is a sheet of pure white blooms. The floor of the house is composed of soil in which are planted Tomatoes, with Tea Roses against the back wall. The plant in question is in a 12-inch pot, but the roots have found their way through the hole at the bottom, and are now rambling in the border. I have seen this same plant many times, but never found it flowerless. Mr. Agate speaks highly of it in producing flowers, which are extremely useful for wreaths, bouquets, or in fact any form of decoration.—E. M.
- ACHIMENES.—There is just now in profuse bloom a very large collection of these pretty old fashioned tuberous-rooted flowers at the London Road Nursery, Reading, where not only have the Messrs. Sutton and Sons collected all the best varieties, chiefly in 48-size pots, and in that perfection of cultivation which always characterises all that is there done, but they have them filling the long span-house. From out of the whole number I sclect as, to my mind, the most beautiful—Ambrose Verschaffelt, white, veined with dark blue; Celestial, lavender blue; Longiflora major, deep blue; Masterpiece, purple; Alba major, pure white; Harry Williams, deep rich rosy crimson; Lady Lyttleton, ruddy carmine; Rose Queen, rosy magenta; and Splendens, fiery scarlet—as being a beautiful collection, although all the varieties are very charming.—D.
- Kola.—Some useful information with reference to this valuable plant is contained in a report on the botany of Sierra Leona presented to the Colonial Office and published as an official paper by Mr. C. F. Scott Elliot. The tree Kola acuminata, Mr. Elliott says, grows freely everywhere, and is found from the sea level to fully 3000 feet at Sumbauaya, in the Talla highlands. It appears to thrive wherever planted, and is well able to hold its own in the original native bush. Mr. Elliot could not find any special conditions of soil as necessary, but it certainly grows on disintegrated gneiss, red grit or laterite, dolerite, and occasionally on dry alluvium. He does not think he ever saw it on marshy ground or soil liable to be overflowed, and in planting the tree such places ought to be avoided. It begins to bear in seven years, and is in full bearing after eight to ten years. Each tree is said to yield £3 to £4 per annum, and hence a plantation ought certainly to include a large number of these trees. The yield given by Mr. Fawcett is 125 lbs., or 4000 seeds per tree—that is, £8 to £10 per tree, or £800 an acre. Semler says it produces 50 kilog. in the tenth year. At present the nuts are chiefly used by the natives, but so much has been done of late years to bring their valuable properties before the public that it may be safely said that the demand in Europe is sure to increase. The following are some of its properties. A nut, or even half a nut, will enable a man to go without food and support great fatigue for twenty-four hours or more. It is an excellent nerve tonic, and is especially good for keeping the brain clear and active at night. It, however, prevents sleep almost too thoroughly, and should not be taken less than four hours before bed.—(The Times.)

Weather at Liverpool.—Last week the heat was intense, all kinds of vegetables showing greater signs of distress than has been apparent this season, more particularly Lettuces, which were simply scorched. Friday last was one of our hottest days, the thermometer on a south wall registered over 100°. On Saturday welcome rain descended. Sunday more rain fell in gentle showers, and on Monday at 11.30 A.M. we had a thunder shower of unusual severity, which rendered spouts and grids in many places quite ineapable of taking away the immense volume of water. As I write (6.30 P.M., Monday) a steady rain is falling.—R. P. R.

— THE QUEEN AND THE GARDENER.—A daily contemporary says, "At the luncheon of the Council and Judges, held at the Royal Botanical Gardens, Manchester, last week, Mr. Bruce Findlay, the Curator, in proposing the health of the newly married Royal couple, said, 'I may perhaps be excused for mentioning an incident (not a secret, inasmuch as it is known to Her Majesty the Queen). In the year 1821 my father was a gardener in the then Duke of York's garden at Oatlands Park, in Surrey. The Princess Victoria, then a baby, was in the garden with her nurse and fell into a pool of water. My father, who was near at hand, pulled the baby out of what might have been a watery grave.'"

MIGNONETTES.—Somewhat of a surprise this wonderfully dry season was it to see the extraordinary free growth from seed at Reading of these hardy annuals. The product was as good at the seed farm where there was no watering as at the nursery, where possibly beds may have been watered. Out of the many varieties grown a few seemed to stand out as specially good, and of these for purity of whiteness none excels the Double White, a variety that is not yet thoroughly fixed, but doubtless will be so in good time. The best single white is the Giant White, a first-rate variety for massing and cutting from. Golden Queen is a really beautiful golden yellow, very true and of a compact habit, and the Giant Red Pyramidal is the best of its section. Those who like Mignonettes, and they are literally everybody, should secure these four varieties at least.—D.

HAIL AND HEAT.—A correspondent, writing to the Standard, says, "It may interest readers to learn that this locality, Amisfield Tower, near Dumfries, N.B., was visited, about half-past 12 to 1 P.M., July 8th, with a severe thunderstorm, with lightning accompanied with very large hailstones, formed of solid ice, averaging from 3 to 4 inches in eircumference, and were picked up by the writer $4\frac{1}{2}$ to 5 inches; it seems almost incredible. As a matter of course a large quantity of glass in vineries has been destroyed, in many cases riddled as if with rifle bullets. At the time the thermometer was 73° in shade. Such a visitation is unknown to the oldest inhabitant." The conjunction of heavy hail and great heat is a characteristic of certain climatic belts of the temperate zone. We have seen in South Africa, on a day when the temperature was about 96° in the shade, hailstones fall which riddled the corrugated iron verandah above our head till it resembled a colander.

- THE BIRKBECK BANK .- The forty-second annual meeting of the Birkbeck Building Society was held on the 5th, at the offices, 29 and 30, Southampton Buildings, Chancery Lane. The report adopted states that the receipts during the year which ended March 31st last reached £12,169,030, making a total from the commencement of the Society of £163,297,213. The deposits received were £9,857,817, and the subscriptions £215,871. The gross profits amounted to £213,867. The surplus funds now stand at £5,727,331, of which £1,670,210 is invested in Consols and other securities guaranteed by the British Government. Upwards of two millions (2,093,590) registered in the books of the Governor and Company of the Bank of England. The subscriptions and deposits withdrawable on demand amount to £5,883,572. The new accounts opened during the year were 13,752, and there are altogether 67,244 shareholders and depositors on the books. Since its establishment the Society has returned to the shareholders and depositors £135,309,265, the whole amount having been repaid upon demand. During the panic brought about in September last by the collapse of the Liberator and its allied companies, the run on the Birkbeck lasted eleven days, and £1,578,005 was withdrawn. Only when it became known that every depositor could be paid in full did the panie subside. So large has been the amount of deposits received since that panic that the Directors have thought it prudent to reduce the rate of interest on deposit accounts from March 31st, 1893, to 2½ per cent., a step which they believe has materially strengthened the position of the Society, and which will enable them in future to invest a still larger proportion of the funds entrusted to them in Consols and other British Government securities.

POTATO SNOWDROP.—With us this season the above-named variety has yielded a wonderfully fine erop of handsome tubers, and the quality has been first-rate. We planted a good breadth a yard distance between the rows, and half that space between the sets, and the ground was perfectly hidden by their vigorous stalks. In these gardens Potatoes are not usually of good quality, the ground being too strong, but Snowdrop is an exception, and as a consequence obtains more space than other sorts. It remains good, too, over a long season. For exhibition purposes it is well suited, because of its clear skin and handsome form. It is a very early variety to mature, and for this reason should be useful to those having restricted garden space, because of planting the ground with another winter crop after the Potatoes are lifted. Snowdrop is also a good market Potato, that is where it grows as it does hereabouts. I have seen no other sample in the greengrocers' windows equal to this variety up to now, or command the same prices.—W. STRUGNELL, Rood Ashton.

- COAL TAR TO PROTECT TREES FROM INJURIOUS INSECTS .-Discussions continue as to whether coal tar is or is not injurious to the bark of trees. It has often been recommended, in order to paint around the base of trees that are liable to the attacks of borers—for instance the Apple borer, Quince borer, and Peach borer. Certainly, the writer has known of cases where it has been applied without the slightest injury, while there are undoubted eases of trees having suffered by its use. Just how this variation in effect comes about is not clear, nor does it much matter to the practical man. If is safe to say that sometimes coal tar so applied is a serious injury; but why use coal tar at all? Pine tar is just as effectual in preserving trees from the ravages of these noxious insects, and certainly does no damage to the tree. It is one of the best preventives against the inroads of stem borers, that is, when these borers operate near the ground, and it is also effectual in preserving the trees from the ravages of mice in winter time. Many trees, especially in regions where the ground is covered by snow in the winter time, suffer seriously from the attacks of micc.—(Meehans' Monthly.)

- EMPLOYMENT OF GAS LIME.—Your correspondent "E. M." (page 9) may rest assured that I have advised the use of gas lime to allotment holders only with the greatest possible care. A dressing is laid on to vacant ground, especially that previously occupied, or to be occupied with Onions, early in the winter, and allowed to become disintegrated through the action of the frost, then forked in several inches in depth a month at least before the ground is sown. Where ground is trenched the dressing of gas lime should be put on after that work is done, as it is the top several inches of soil that contain the elements of harm in the shape of chrysaloids, of course that is assuming that the top soil is kept on the surface in trenching, and is not thrown into the bottom of the trench. I have read of a thin dressing of gas lime being advised to be strewn along the spaces between the rows of the young Onion plants as giving off a perfume that is obnoxious to the fly. That seems to be dangerous advice, especially that it might lead to much tramping of the plants. I very much doubt whether, having regard to the relative values of the two vegetables, the present plague of maggots is not worse for Onions than is the Peronospora infestans for Potatoes. In any case, apart from any ameliorative action, more harm relatively seems to be done to the Onion than to the Potato. Whosoever ean devise any practical and perfect cure for the Onion maggot will deserve well of his country.—A. D.

THE BEXLEY BEGONIAS.

"Not at home," was the response to my inquiry at the door of Mr. Horticultural Builder Burton on the occasion of a recent visit to the Bexley Peacheries, and "Not at home" was the same dismal refrain when after a mile and a half's walk I reached the residence of Mr. Begonia Pope, near the famous wayside hostelry known as the Old Crook Log, Bexley Heath. It was a double disappointment, not tempered by the fact of having to take the sunny side of the familiar reading, "90° in the shade, 120° in the sun" for the aforesaid walk; but the Begonias had returned from Earl's Court if the grower had not, and so the danger of my disposition becoming as erooked as the ancient billet itself was happily averted.

I ventured to pen a few remarks last year about Mr. T. S. Ware's Begonia Enterprise at Bexley, and am glad to observe that there has been a further advance in the high merits of his strains during the past season. The novelties embrace some very beautiful and distinct varieties, which can hardly fail to be widely sought after. The inevitable Princess May was amongst them. It is a fringed double flower, pure white and pleasing, by no means a commonplace addition to the whites. More distinct is a magnificent seedling double, as yet unnamed, the colour of which is not easily to be described. It is a rich, brownish bronze with a deeper edge; but the words give no adequate idea of the unique shade the flower possesses. There is a sunset glow

about it which cannot be transferred to paper. These bronzy hues vary greatly; but all are beautiful, and it is to be hoped that we shall get many of them. Another bronzy double, a totally distinct type of flower, is Iona, a light golden bronze of great beauty. Its blooms partake of the Ranunculus shape, a clear break from the Hollyhock section. Amongst many other good doubles the following may be noted:—Queen Victoria, rosy blush, is a fine variety which received a certificate at Earl's Court; the bloom is excellent, and the plant flowers freely. Mrs. Fell, which was seen last year, is a large and very fine salmon pink, free and good; Bexley Gem is a glowing carmine of great beauty, representing a first-rate type of plant and flower. Rosebud is now well known; this charming little variety is becoming a universal favourite. Alba Magna is an admirable type of white, flowers and habit both being of the best. Beauty of Belgrove, soft silvery pink, free and good in every way, may be taken as a standard variety in its colour just as the comparatively old Henshaw Russell may be amongst the scarlets. Brilliant, rich scarlet, a bold grower and free bloomer, is another excellent red. Amongst the pinks one of the best is Pavona;

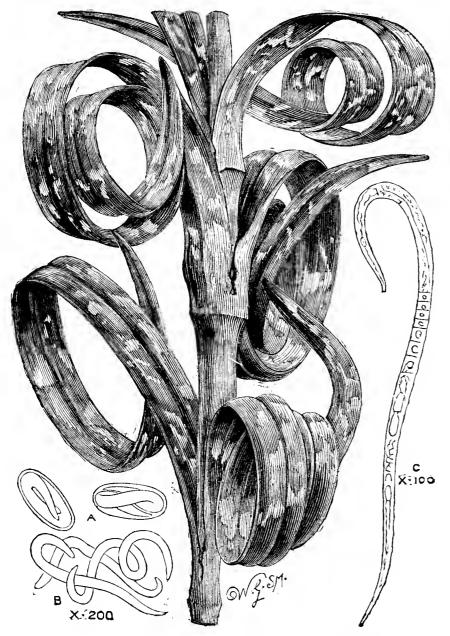

FIG. 5. - CARNATION ATTACKED BY EELWORMS.

and Una, rosy pink, is equally pleasing. Of the yellows a prominent position must be accorded to Duchess of Teck, an excellent sort in every way. The flowers are light in colour, and might be described as lemonhued. Another light yellow is Solferino, but this is flushed with pink. At the risk of making the list appear formidably long I add mention of another trio—Viscountess Cranbrook, salmon red, with white centre; Jennie Fell, deep crimson, a Camellia-flowered variety of exceptional charm, and Picotee.

The singles are quite as mcritorious as the doubles, perhaps as a whole they are even better. I commence with what is quite likely to become one of the most popular of all, and that is Champion, a variety in which flowers of a distinct and lovely golden bronze shade are associated with grand habit and foliage. Perfection, something in the same way, was good, but Champion is far better. Then there is a light bronze seedling with a faint Tea Rose odour; I am sorry to be unable to distinguish it by a name. When our friends get hold of a good thing why do they not name it at once? Angelina Scraggs would be better than nothing. What is wanted is something to distinguish it by. Pride of Bexley is a splendid type of white, and Sovereign of yellow. The former has large and perfectly round pure white flowers freely borne, and Sovereign, in addition to its excellent flowers, has grand foliage. Bexley White is another splendid variety, larger than Pride of Bexley, but less rounded. Lord Byron, scarlet with white centre; Zanda, a v 1y large rosy red; Alba Fimbriata, a white with round fringed flowers;

Black Knight, very dark velvety crimson, well rounded, and a free bloomer; Magneta, vermilion; Venus, rich dark crimson with white centre; Heroine, rich bronzy scarlet, well rounded and free; Nerissa, a glowing rose with immense flowers; Superba, a fine light red; and Moravia, a crimson with flowers of perfect form, are all worth growing. So is Sunset, a free and beautiful golden bronze. Other notabilities are Marginata, white with a broad crimson margin; Crimson Bedder, a most vigorous and free flowering dark red; Alba Marginata Fimbriata, white with broad carmine edge; and Goliath, a large bronzy buff with immense foliage.

It is perhaps a little injudicious to name so many, but after all there are many tastes to cater for. It is pleasing to be able to record that the strong-stemmed and erect-flowered type of plant is being maintained. Of the 200,000 plants out of doors it is yet too early to speak, but judging by last season there will be as big a blaze as if the Old Crook Log had caught fire by-and-by. For this, however, we must have a few lapses from the 120° in the sun reading, otherwise the season will be too dry to give them a fair chance.—W. P. W.

ROYAL HORTICULTURAL SOCIETY'S FOUR DAYS'

As regards the above subject, I, as a grower and exhibitor of fruit, entirely concur with the remarks of the correspondents, "A Fruit Grower and Exhibitor," and "A Midland Counties Fruit Grower" (page 9). A four-days show may be some advantage to the Royal Horticultural Society, but I think the Council should be reminded that it is a serious matter for exhibitors to absent themselves from home for nearly a week, and at the same time expose their employer's property to the parching heat and dust of the Agricultural Hall till it is completely ruined. During the past few weeks I have heard men well qualified to give an opinion say that unless the period of the Show is shortened many would-be exhibitors may go elsewhere, and this is the course which will be adopted by—F.R.H.S.

[Our correspondent is one of the best and most successful exhibitors.]

ROYAL BOTANIC SOCIETY'S EVENING FETE. JULY 5TH.

AN evening floral fête was held in the gardens of the Royal Botanic Society, Regent's Park, on Wednesday, July 5th. Fine weather prevailed, and the gardens were brilliantly illuminated. Prizes were offered for dinner table decorations, groups of plants, bouquets, and other floral arrangements, and in most classes the exhibits were very good. Several exhibits of plants and flowers, not for competition, came from various nurserymen. These included a grand collection of Roses from Messrs. W. Paul & Sons, and hardy flowers from Messrs. Barr & Sons and J. Cheal & Sons.

In the competitive classes Messrs. Osler & Co., 100, Oxford Street, W., were awarded the first prize for a dinner-table decoration, Mr. W. P. J. Youens, Tower Cottage, Dartford, Kent, being the other prizewinner. Miss M. V. Seale was first for a table decoration for dessert, the other prizes going to Messrs. Osler & Co., and Miss M. Gardner, Park House, St. John's Wood Park, N.W., respectively. The last-named exhibitor received a silver medal for her arrangement of a buffet. The class for the decoration of a supper table brought forward some admirable work, the exquisite use of Shirley Poppies gaining for Mr. J. R. Chard, Brunswick Nurseries, Stoke Newington, N., the first prize. Other successful competitors were Mrs. Howard White, and Mr. H. O. Garford, the Floral Depôt, Stoke Newington. Mrs. H. O. Garford was first for her arrangement of an epergne, while the second and third prizes were awarded to Miss Alice Perkins and Messrs. Osler respectively. The silver medal for flowers for personal adornment was awarded to Messrs. Perkins & Sons. For a bridal bouquet, Messrs. Harwood Bros., Balham Nurseries, Balham, were first; Messrs. Perkins & Sons, and Mr. J. Russell, Devonshire Nursery, Haverstock Hill, N.W., being second and third; and for a ballroom bouquet Messrs. Harwood Bros. were first, Mrs. H. O. Garford and Miss Minnie Barrett being second and third respectively.

Mr. H. O. Garford, Messsrs. Perkins & Sons, Coventry, and Mr. R. Potter, gardener to Sir Mark Collet, Sevenoaks, were awarded the prizes for a sideboard decoration in the order of their names; while in the use of hardy flowers for sideboard ornamentation the successful competitors were Mrs. M. Gardner and Mrs. E. Sperling of Southend. Mr. R. Scott, gardener to Miss Foster, The Holme, Regent's Park, was first for his decoration of a window; and for a group of plants in a recess Mr. W. Chalk, Langworth, Streatham Hill, following in both classes.

DISEASES OF CARNATIONS.

FEW, if any, garden plants have of late years suffered from disease to an equal extent with Carnations. The chief ailments are one caused by microscopic eelworms, and two caused by parasitic fungi. One of the latter, although widespread and virulent, has, as far as I know, never been described as British till a brief notice was published in the Journal of Horticulture on June 15th last, page 480. At any rate it is not given in any text books of the most recent date.

A few weeks ago a correspondent of the Journal of Horticulture sent examples of "Malmaison" Carnations infested with eelworms to a degree I had never seen before. The stems were swollen, and in several instances the leaves were spirally twisted as if writhing in agony.

Attacks of parasitic fungi commonly cause a similar twisting. In this district, Poppies, which are extremely common in the cornfields, are frequently attacked by a Peronospora (an ally of the Potato fungus), and this attack causes the flower stems to become twisted into inextricable knots with the flowers and seed vessels pointing downwards as frequently as upwards, or involved in the knots of the twisted stems.

An example of a Carnation stem, swollen in the middle and with leaves twisted with disease, is illustrated in fig. 5. The disease spots are white and semi-transparent; when held to the light the inner substance of the leaves is seen to have been eaten away. If a small portion of the leaf, taken from the neighbourhood of the disease spots, is placed under the microscope, eelworms young and old, and male and female, with a vast number of eggs, will be seen as illustrated at A, B, and C. In a diseased Carnation plant these minute animals exist apparently in uncountable numbers. The name of the eelworm is Tylenchus devastatrix, Kühn. The minute transparent eggs, with the young coiled up inside, are shown at A, and the young just emerged from the eggs at B, enlarged 200 diameters. An adult female example is shown enlarged to 100 diameters at C. The male differs slightly from the female, but for all practical horticultural purposes the illustration will answer for both sexes. In some eelworms the sexes differ greatly from each other in general form. I have grown Carnations from a single diseased plant for eight years in succession; every season the old plants have been burnt and new plants secured from layers apparently free from disease, yet every season the new Carnation plants have swarmed with eelworms. The plants become equally diseased in the open garden and greenhouse. This fact shows how necessary it is when plants once become infested to entirely destroy them, every fragment from a diseased plant seems to bear the eggs of the eelworm (or Nematode) in its tissues. The minute animals live and breed chiefly inside the leaves, and the transparent spots are caused by the tissues being eaten away. The worms are easily destroyed by caustic solutions, but as the creatures live within the stem and leaves it is almost impossible to get at them. The attack of eelworms or threadworms frequently comes from infested earth or water, and plants are at once attacked by Nematodes if grown in earth containing chopped up diseased material or if watered with water in which infested plants have been broken up and introduced. Tylenchus devastatrix is common in a living state in dung; the animal infests Clover and Grasses, and passes in a living state and uninjured through the intestines of sheep, oxen, horses, and other animals.

Mr. John J. Willis has experimented with success at Harpenden on infested Clover fields, but experiments made on acres of land seem hardly applicable to a limited number of Carnations in a flower garden. Mr. Willis, as reported by Miss E. A. Ormerod, found that sulphate of ammonia and sulphate of potash together at the rate of 4 cwt. per acre acted most effectually. Sulphate of iron at the rate of 2 cwt. per acre caused the attack of Tylenchus to cease, but half this amount did not entirely check the attack. Infested earth can be successfully treated with gas lime—see the leaflet by the late Dr. Aug. Voelcker on "Composition and Uses of Gas Lime," published by the Royal Agricultural Society of England. For other methods of treatment see the number of the Journal of Horticulture already quoted. This disease was first noticed in this country in the autumn of 1881, and an illustration and description was published in the "Gardeners' Chronicle" for December 3rd, 1881.

The disease caused by a parasite fungus named Helminthosporium echinulatum, B., has been known since 1870, when a description and small illustration was published in the "Gardeners' Chronicle" for March 19th, of that year. It was again illustrated in greater detail in the same journal for August 21st, 1886. A fragment of a Carnation leaf attacked by the Helminthosporium (a brown fungus mould), is illustrated natural size at D (fig. 6). It will be observed that the fungus grows on both sides of the leaf in a concentric fashion; a minute spot first appears, next a ring round that spot, then a larger ring, one outside the other, till in bad cases the rings become confluent and the foliage is soon utterly destroyed. The fungus in a fruiting state is superficial, but the mycelium, or spawn from which the fungus arises, is partially within the membranes of the leaf. The parasite, of course, lives by abstracting and living upon the vital juices of the host plant. The fungus itself as seen under the microscope and enlarged 300 diameters is shown at E. It bears a vast number of jointed spores; at first these spores are simple or without joints, but at length each spore becomes divided into from two to six parts, the spores are faintly brown in colour and covered with almost invisibly minute spines. At maturity the spores break to pieces at the joints, and every fragment is capable of reproducing the disease. These fragments are doubtlessly carried in the air in millions, and many probably hibernate in the open ground through the They certainly hibernate in greenhouses. Sometimes this Helminthosporium infests Sweet Williams, and a fungus not to be distinguished from the Carnation fungus frequently grows on Ornithogalum and perhaps other plants. The parasite is a close ally of the fungus which causes the worst form of Tomato disease. Hand-picking of diseased leaves has been recommended as a remedy. As the parasite lives partly within the leaf it is most difficult to get at, although spraying with a fungicide might stop its growth; the safer and more effectual Potato fungus solutions might also be tried. The almost unlimited power of spore production in the Helminthosporium makes its position almost unassailable.

The third parasite illustrated at F is as destructive as the other two. The fungus which causes the mischief is known as Uromyces

caryophyllinus, Schræt. It is illustrated natural size at F. I have known it and its effects for many years, but I think this is the first time it has been illustrated in this country. The fungus is an ally of the Hollyhock fungus and the red rust of corn. It grows wholly within the leaf, which it distorts, and it ultimately bursts the membrane of both sides for the emission of the spores. A small fragment of a Carnation leaf attacked by Uromyces is shown in section at G, enlarged 50 diameters to show the spore pustules rupturing the leaf membranes above and below. Two sets of spores are produced. The spores illustrated at H, enlarged 300 diameters, are called Uredo spores, these are orange in colour and covered with minute spines, they are produced in inconecivable numbers and quickly germinate upon Carnation leaves. The germtubes from the spores gain access to the interior of the leaves by the stomata and then quickly form new pustules. This process is repeated till in bad cases all the foliage is involved in disease. Towards the end of the flowering season resting spores are formed as illustrated at I, enlarged 300 diameters. These resting spores are somewhat darker in colour than the Uredo spores; they are furnished with a much thicker

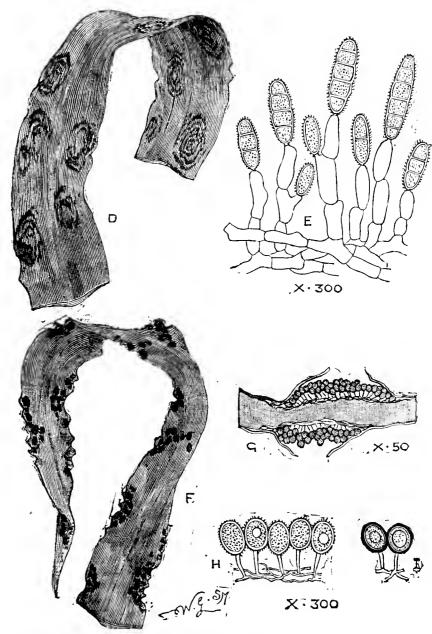

FIG. 6.—CARNATION FOLIAGE ATTACKED BY HELMINTHOSPORIUM (D)
AND UROMYCES (F).

membrane or skin, and are smooth. The resting spores hibernate through the winter in dead Carnation refuse, and germinate in this decaying material in or on the ground in the spring, at which time they make their attack on previously unaffected Carnations. In greenhouses the fungus grows continuously all through the winter by its Uredo spores; it however frequently produces resting spores in the same pustules with the Uredo spores. This latter fact shows how necessary it is to burn or deeply bury all disease-infected garden material. Uromyces caryophyllinus is not confined to the Carnation—Dianthus Caryophyllus, but occurs on D. superbus and D. prolifer.

As this fungus grows entirely within the plant attacked, it is obviously most difficult to reach either by sponging or spraying. It is reported that the ravages of the Potato fungus as well as of other fungi whose habit is to grow within the tissues of the host plant have been checked by spraying: if the reports are correct similar good results might follow the spraying of diseased Carnations. If diseased and dying plants cannot be saved, disease can be prevented from spreading by clean gardening, plenty of air in greenhouses, and the destruction of all tainted material. If a plant attacked by Uromyces is placed in a greenhouse the disease will at once spread with terrible rapidity to other plants in the house. Mr. Martin R. Smith informs me that this fungus seems powerless with him out of doors, and that varieties with exceptionally blue foliage resist its attacks. Mr. Smith says that

Condy's fluid kills the fungus, and that two applications with the syringe or sponge are generally successful. Permanganate of potassium in water, which is of the same nature with Condy's fluid, is a very cheap material, and has often been used with good effect as a remedy for plant diseases.

A few other fungi sometimes spread to Carnations from Lychnis and other genera of the Caryophyllaceæ, but the two here described are the chief depredators. Carnations too are frequently attacked by the larvæ of insects.—Worthington G. Smith, Dunstable.

SUNNINGDALE PARK.

THE village of Sunningdale is a charming place, the air being fresh and pure, not affected by the smokes of London, despite the fact that it is very little over twenty miles from the metropolis. On the occasion of a recent visit to the neighbourhood I was struck with the healthy green foliage of the trees, and this after such a long drought. I called at Sunningdale Park, the beautiful seat of Major Joicey, and asked for the permission to view the gardens. This request was readily accorded by the skilful and courteous gardener, Mr. T. J. Thorne.

Before going to the gardens we walked round the park, and here it was observed that many alterations were being carried out. Huge mounds had been gradually carted away to be deposited where it was thought the natural beauty of the place would be enhanced thereby. The improvements thus effected are most marked now, though they are as yet only in their infancy, and when the whole is finished there will be many splendid views through the trees. In front of the mansion a lake has been formed, and with the addition of a small waterfall it will be one of the most charming spots on the estate. Rhododendrons form an attractive feature, for thousands have been planted, and though at the time of my visit the best of the blooms were gone, some perfect trusses of beautifully coloured flowers were still to be seen. And how well the plants all looked! Many of them have only been planted for seven months, and the majority between one and two years; but even the most recently planted ones have made wonderful growth, and the young foliage presents a healthy green appearance. They are planted in a loamy soil with an admixture of peat, such as can be obtained from the woods on the estate, and farmyard manure, and they revel in it. What a magnificent display they will make a few years hence!

The principal drive to the mansion, lined on each side with hardy evergreen shrubs, including many of the best Rhododendrons, is splendidly lit with the electric light, as also is the house itself. When the shrubs were in flower it must have looked grand either in the day-time or at night, when the soft mellow light from the electric lamps was diffused around and over them. The engineer very kindly allowed me to look at the machinery and engines by which the place is lighted; and the cleanliness which pervaded the whole place was most noticeable. From here we journeyed to the lawns, which are extensive, and amongst the finest I have seen this season; when at the lower part a charming view of a corner of the mansion is afforded by breaks in the trees and

over mounds of green turf.

Equally at home in the fruit and kitchen gardens as in the park and pleasure grounds is Mr. Thome, for they are all splendidly kept. Perhaps the most striking feature in the fruit garden is the extraordinary number of Strawberries. Noble is planted in abundance, as also is John Ruskin, and both were carrying superb crops of their delicious fruits at the time of my visit. President and Dr. Hogg were producing abundance of fruit, which ripens when the two first named have long been over. Gooseberries, Raspbeiries, and Currants are bearing heavily. fair and Apples light, the fruit, owing to the long-continued drought, not having set well. In the houses, some new ranges of which have been erected recently, everything bears the stamp of health. Peaches are looking particularly well, there being an abundant supply of both ripe and unripe fiuits. Size does not appear to be a desideratum either with these or Grapes, a number of medium sized fruits and bunches being the object in view. Early Dagmar Peach is grown for early use, it being a good cropper and of very fine flavour. A number of Pines plunged in a bed of leaves in a house in which Crotons are grown look well. Many of the plants are carrying grand fruits, some of which were almost ripe while others were still in the green state. One of the finest fruits was on a plant of Charlotte Rothschild and another on the Queen. In the kitchen garden some rows of Exonian Pea are very prominent. The crop is a very heavy one and the pods of good size and remarkably well filled. In height Exonian grows from 3 to 4 feet, and is th€ best early Pea I have seen this season. Chelsea Gem is also largely grown, but

the one previously named is decidedly earlier.

The ranges of houses devoted to floriculture and the flower garden look bright and clean. In the latter Roses form the chief attraction, and are a source of never ending pleasure to all who love flowers. There are no formal-looking beds, they are not appreciated; everything is planted so that Nature may lend her aid in intensifying the charms of the plants. The houses, of which several have been recently erected, are splendidly built and well furnished with flowering and foliage plants. A brilliant scarlet Carnation, the flowers of which combine perfect form with grand substance, was very noticeable. It is a seedling of Mr. Thorne's raising, and has been named by him "Mrs. Joicey." Orchids, too, are a feature here, as mentioned in the Journal of Horticulture for June 22nd, page 495. When the houses it is proposed to build are finished, and the alterations in the park and gardens carried out, Sunningdale Park will be a grand estate.—W.

NATIONAL CARNATION AND PICOTEE SOCIETY.

(SOUTHERN SECTION.)

IF the Southern Show of the National Carnation Society is early this year it was by no means the failure that some easily frightened people anticipated. True, some growers were unable to poll their usual strength, Mr. Sydenham, for example; but most of the leading exhibitors staged extremely well, and the Show as a whole was an excellent one.

There were three stands of twenty-four Carnations, and after a good struggle between Messrs. Douglas (gardener to Mrs. Whitbourn) and Turner, the former was placed first. Both had very good stands. Mr. Douglas's flowers were as follows—Back row: Tim Bobbin (2), Charles Henwood (2), S. Adams, Lady Mary Currie, and two seedlings. Middle row: Miss Constance Grahame, Harmony, Agricola (2), Arthur Medhurst, and three seedlings. Front row: Mrs. Douglas, Edward Rowan (2), Miss Constance Grahame, Robert Lord, and three seedlings. Of Mr. Turner's smooth, fresh collection Charles Henwood, Harmony, Dr. Hogg, and Lord Lewisham were some of the best flowers. Mr. Hooper of Bath was third. Mr. Martin Rowan, 36, Manor Street, Clapham, won with twelve. His flowers were somewhat thin and flat, the varieties being Robert Houlgrave, George Melville, J. S. Hedderley, Alfred (2), J. D. Hextall, Joe Edwards, John Buxton, Gordon Lewis, Sportsman, Edward Rowan, and Rob Roy. Mr. A. R. Brown, Handsworth, Birmingham, was second—not far in the rear. His flowers were larger than those of Mr. Rowan, but one or two had fallen and weakened the stand. Mr. Chaundy, New Marston, Oxford, was third; Messrs. Thomson & Co. fourth; Mr. R. Sydenham, Birmingham, fifth; Mr. Chas. Phillips, 18, Hamilton Road, Reading, sixth; Mr. J. Walker, Thame, seventh; and Mr. Thomas Antiss, Brill, eighth. There were four stands of six, Mr. J. J. Keen, Southampton, being first with Squire Potts, James Douglas, Alisemond, C. H. Herbert, Robert Houlgrave, and John Keet. It was not a good stand, C. H. Herbert and Robert Houlgrave being anything but first rate. Mr. A. Greenfield, Sutton, was second; Mr. A. J. Sanders, gardener to Viscountess Chewton, third; and Mr. Nutt, Southampton, fourth.

There were three stands of twenty-four Picotees, Mr. Turner being first, Mr. Douglas second, and Mr. Hooper third. The Slough grower had a fairly good stand, the varieties being (back row) Lady Catherine Gordon, Esther (2), Favourite (2), Little Phil (2), and Brunette. (Middle. row) Sylvia, Mrs. Sam Beal (2), Brunette, Lady Ponsonby, Dr. Epps, Mrs. Tweedale, and Zerlina; (front row), Dr. Epps, John Archer, Madeline (2), Morna (2), Lady Holmesdale, and Mrs. Tweedale. Mr. Douglas had good blooms of Jessie, Ganymede, and Mrs. Sharp, but, as a whole, the flowers were a little thin. The first of the nine stands of twelve was that from Messrs. Thomson & Co., their flowers being very bright, clean, and fresh. The varieties were Mrs. Sharp, Little Phil, Brunette, Zerlina, Favourite, Amy Robsart, Campanini, John Smith, Dr. Huxley, J. Williams, and Mrs. Burnett. Mr. A. R. Brown was second with thin but clean flowers, Mr. Rowan third, Mr. Chaundy fourth, Mr. Phillips fifth, Mr. Sydenham sixth, Mr. Walker seventh, and Mr. Sanders eighth. There were seven stands of six, Mr. Jones winning with a beautiful box made up of Little Phil, Norman Carr, Clara Pearson, Mrs. Payne, Campanini, and Brunette. These were all good flowers, Little Phil being very fine. Mr. J. P. Sharp was second with somewhat rough flowers, Mr. Greenfield third, Mr. Ribbick fourth, Mr. Keen fifth, Mr. Jordan sixth, and Mr. J. Gilbert, gardener to the Rev. L. R. Flood,

seventh.

Yellow grounds were quite as great a feature as the whites. Mr. Chas. Blick, gardener to Martin R. Smith, Esq., Beckenham, had a splendid stand of twelve, eonsisting of Dorothy, Madame John Benary, Almira, Lohengrin, Annie Douglas, Mrs. R. Sydenham, Chrysolora, Countess of Jersey, Remembrance, Stadtrath Bail, Cowslip, and Optimus in beautiful order. Mr. Turner was second, also with a charming box, Annie Douglas, Almira, and Mrs. R. Sydenham being particularly noticeable. Mr. Douglas was third, Mr. Phillips fourth, Messrs. Thomson & Co. fifth, Mr. Chaundy sixth, and Mr. Anstiss seventh. There were thirteen stands of six, and they formed a lovely display. Mr. Jones won with Stadtrath Bail (a grand bloom), Lord Rendlesham, Victory, Almira, Mrs. Robt. Sydenham, and Atalanta, a splendid stand. Mr. Brown was second, Mr. Sydenham third, Mr. Chas. Harden fourth, Mr. Hooper and Mr. Nutt equal fifth, Mr. Keen sixth, and Mr. Henwood seventh.

The Selfs and Fancies were also a lovely display. Mr. Turner had a grand stand of twenty-four, the flowers being well filled and in beautiful colour. The back row blooms were Janira, Germania (2), King of Scarlets (2), and Romulus. Second row: Schlieben, Gladys, Terra Cotta, Mr. Murray, The Governor, and Stadtrath Bail. Third row: Mrs. Laing, Dorothy, Mrs. Fred. Romulus, Ruby, and Rose Unique. Front row: Gladys, Rose Unique, Mrs. Wilson, White Lady, Duchess of Sutherland, and Edith Wynne. Mr. Douglas was a good second, and Mr. Blick third, and Mr. Hooper fourth. Messrs. Thomson & Co. won with twelve, his varieties being Firefly, Attraction, King of Purples, Germania, F. Phillips, Mrs. Reynolds Hole, Mrs. Fred Gilbert, Celson's Santazza, and two seedlings. Mr. A. R. Brown was second with a very clean bright stand, Mr. Phillips third, Mr. Chundy fourth, Mr. Walker fifth, Mr. Rowan sixth, and Mr. Harden seventh. Mr. Harden won with Dodwell's 167, Victory, Favourite, Mdme. Van Houtte, Harmony, and Lady Mary Currie in the class for six Carnations and Pieotees; and of the seven stands of six Selfs and Fancies Mr. Jones won with Norman Carr, Almira, Stadtrath Bail, Lord Rendlesham, Germania and Gladys, all good flowers. Mr. J. F. Kew, Southend, was second with large

flowers, Mr. Jordan third, Mr. Henwood fourth, Mr. Nutt fifth, Mr.

Rebbeck sixth, and Mr. Spurling seventh.

The following were the awards for single blooms. Scarlet bizarres.-Mr. Rowan first and fifth with Robt. Houlgrave, Mr. Douglas second with a seedling, Mr. Sydenham third with Robt. Lord, and Messrs. Thomson & Co. fourth with C. H. Herbert. Crimson bizarres.—Mr. Sydenham first with Master Fred and fifth with Lord Salisbury, Mr. Douglas third with Tim Bobbin, Mr. Rowan third with Jessica, and Mr. Phillips fourth with John Harland. Pink and purple bizarres.—Mr. Douglas was first with Reliance, Mr. Greenfield second with W. Skirving, Mr. Rowan third and Mr. Brown fourth with the same variety, the latter fifth with Mrs. Barlow. Scarlet flake.—Messrs. Thomson & Co. first with J. P. Sharp, Mr. Rowan second and fourth with Sportsman, Mr. Phillips third with the same variety; and Mr. Brown fifth with Mr. Gordon. Purple flake.—Mr. Turner first with Charles Henwood, Mr. Rowan second with Gordon Lewis, Mr. Douglas third and fourth with Mrs. Douglas, Mr. Brown fifth with Billy Henderson. Rose flake.—Mr. Rowan first with Rob Roy, and fourth with Crista Galli, Mr. Chaundy second and third with Rob Roy, Mr. Brown fifth with Mr. Cooling. Heavy red edge Picotees.—Mr. Turner first with Morna, Mr. Brown second with Brunette, Mr. Phillips third and fourth with Morna, Mr. Douglas fifth with Ganymede. Light red edge.—Mr. Jones first with Mrs. Gorton and third with Thomas William, Mr. Rowan second with Mrs. Gorton, Messrs. Thomson & Co. fourth and Mr. Brown fifth with Thomas William, Mr. Rowan and Mr. Brown fifth with Thomas William Mr. Brown fifth with Thomas William. Heavy purple edge.— Mr. Keen first with Amy Robsart, Mr. Jones second with the same variety and fourth with Muriel, Mr. Rowan third with Muriel and fifth with Amy Robsart. Light purple edge.-Mr. Rowan first with Mary, Messrs. Thomson & Co. second with Edith, Mr. Brown third with Pride of Leyton, Mr. Douglas fourth with Ann Lord, Mr. Keen fifth with Pride of Leyton. Heavy rose edge.—Mr. Jones first with Campanini and third with Mrs. Payne, Mr. Turner second with Little Phil, Mr. Rowan fourth with Little Phil, and Messrs. Thomson & Co. fifth with Mrs. Burnett. Light rose edge.-Mr. Brown first and third with Mrs. Ricardo, Mr. Phillips second with Ethel and fourth with a seedling, Mr. Keen fifth with Ethel. Heavy scarlet edge.—Mr. Jones first with Mrs. Sharp, Messrs. Thomson & Co. second with the same variety, Mr. Keen fourth with Mrs. Sharp, and Mr. Douglas fifth with the same variety. There was no name with the third prize flower. Light scarlet edge.—Mr. Jones first with Favourite, Mr. Turner second, Mr. Brown third, and Mr. Keen fifth with the same variety, Mr. Douglas fourth with a seed-ling. Yellow grounds.—Mr. Jones first, Mr. Phillips third, and Mr. Douglas fourth with Mrs. Robt. Sydenham, Mr. Turner fifth with Countess of Jersey. The second prize bloom was also Mrs. R. Sydenham, but the name of the prizewinner was missing.

The border Carnations were much admired by all visitors. Mr. Martin Smith had a most beautiful collection not for competition, to which a silver Flora medal was adjudged. In the competition for nine varieties Mr. Douglas won, but his flowers were not named; Mr. Hooper was second; Mr. W. H. Divers, Ketton Hall Gardens, Stamford, third; and Mr. John Walker, Thame, fourth. Mr. Douglas was also victorious with six, Messrs. Walker, Thomson & Co., Divers, and Hooper taking the other prizes. Mr. Sage won the first of Mr. Martin Smith's prizes for twelve trusses, Mr. E. C. Goble the second, Mr. Douglas the third, Mr. Divers the fourth, and Mr. Barton the fifth. The prizes for buttonholes went to Messrs. Douglas, Thomson & Co., Walker, and Goble in the order of their names; for vases to Messrs. Douglas, Goble, and Thomson; for sprays to Messrs. Thomson, Walker, Goble, and Douglas. Messrs.

Douglas and Turner were first and second with pot plants.

Mr. T. S. Ware had a beautiful display of Carnations not for competition, and was awarded a silver Banksian medal.

HORTICULTURAL SHOWS.

DISS.—July 4th.

For five years in succession this small but vigorous Society has suffered from wet days on the date chosen for the Rose Show, but the weather was this year most propitious for the occasion; and, much as the country requires rain, everyone at Diss must have been glad that at last, just for once, "Flower Show" ceased to be synonymous with "Shower Flow." The Exhibition was held at Hall Hills, the residence of Mrs. Downton, and Roses of course were weak, as they are throughout

the country; but the Show on the whole was a good one.

For thirty-six (open) Mr. F. Cant was first, having good examples of Mrs. John Laing and The Bride. D. Prior & Son were second, including a specimen of Black Prince, which has been good this year. In the class for twenty-four (amateurs) a capital set-to took place for the Frere Memorial challenge cup between the old rivals, the Rectors of Harkstead and Sproughton. Rev. A. Foster-Melliar had a clear lead, and retained the cup for the third year in succession, Lord Macaulay, Mrs. John Laing, and Marie Baumann being among his best; but Rev. H. A. Berner's gardener was decidedly a good second, having a fine light coloured Horace Vernet and a beautiful John Bright. This bloom won the N.R.S. medal as the best H.P., but though lovely in colour it was badly divided, and a Le Havre in the same box would perhaps have better merited the distinction. Rev. F. Page Roberts was third, showing Comte Raimbaud well.

In the class for twelve Roses Mr. Berners was first, and Mr. Page Roberts second. With twelve Teas Mr. Foster-Melliar was first, showing Catherine Mermet and Marie Van Houtte well. In this box and in

his twenty-four were blooms which had been shown at the Crystal Palacc. Mr. Berners was second, showing a very clean Madame Hostc, which gained the medal as best Tea, and a fine Innocente Pirola. In the two local classes Mr. Hammond of Eye won, showing stands of considerable promise.

The herbaceous plant classes are fast becoming one of the features at Diss Show. It is very noticeable how the good example of Mr. Page Roberts, the Hon. Secretary, has caused these flowers to be taken up in the neighbourhood. Diss is but a small place, yet there were here four classes for thirty-six, twenty-four, eighteen, and twelve, and each of them was well filled by amateurs alone. Rev. Page Roberts, Mr. J. Tudor Frere, Mrs. Norris, Mr. J. C. Collins, and Rev. C. James were the principal winners, the latter obtaining the silver medal for excellence of cultivation. Neither Norwich nor Ipswich, shows of more than double the size, had such a grand or interesting display of herbaceous plants.

Vegetables were good, especially the collections shown for the prizes offered by Messrs. Sutton & Sons. Seven groups of plants were shown, the first prize going to Mr. F. Taylor, M.P. Six dinner tables were decorated by ladies in competition, Shirley Poppics and Grasses winning as they always will.

BROCKHAM.—JULY 4TH.

Rose growers will not easily forget the season of 1893. If anything can make a gardener morose it is a prolonged drought. The Brockham Rose Show was fixed for July 4th. It was seen long before that this was much too late. But shows cannot easily be shifted, and in this case a change was not possible. The twenty-ninth Show was held at Denbies, the seat of Lord and Lady Ashcombe, on July 4th, and it was the first appearance in that widely known and most beautiful place. The tent supplied by Messrs. Kendall of Dorking was pitched on the lawn near the house, close by the Beech Walk and surrounded by trees of exceeding beauty. Everything that could be done to help the Show had been done by Lord Ashcombe, and his courteous and most obliging gardener, Mr. Beesley.

It would not be possible, within the limit allowed for this article, to give a full account of the beauties of Denbies. When once you have reached the top of the hill on which the house stands, you forget the past and give yourself up to the full enjoyment of all that can be seen, which implies the grandest of Surrey scenery, and the most extensive views of the ranges of hills near and far, with the town of Dorking, picturesque, compact, and well to do, lying at your feet. To enjoy this thoroughly you should go to the roof of the house and look down upon it, as we, the Committee and the Judges, were invited to do by Lord Ashcombe who personally conducted us. And one of the first things you would notice would probably be the dozen or so lightning conductors of the approved type, one being attached to each chimney. It certainly is a very wide area, but seldom, if ever, would be seen such a pro-

vision against lightning.

On descending, an inspection of the greenhouses (one can walk under glass for more than 600 yards) and gardens was made. In the former all the plants looked the picture of health, and plants both new and old were in great profusion. Bignonia Tueri was very conspicuous, one plant blooming at the ridge of the high conservatory, another plant with hundreds of blooms rambling at great length within reach. Bignonia jasminoides was in very vigorous condition. Grevillea robusta grown as a creeper 20 feet high, was somewhat a curiosity; the Japan Medlar, Limes, Lemons, Tree Tomatoes (like an Egg Plant), Daturas, Canna Ehmani (grand flower), Eucryphia pinnatifolia (like a wild Rose), Erythrina crista-galli (called the Coral Tree) with a deep crimson lobster looking bloom (this was in the open under cover of the wall), Fuchsia fulgens and Salvia patens left out in the open all the winter, and great numbers of climbing Begonias, Fuchsias, with many other plants made these conservatories an horticultural treat.

In the outside garden mention only can be made of Torreya myristica (like a Yew), Abies pungens glauca (the gift of Mr. Appleby and planted in honour of Lord Ashcombe's promotion to the peerage), beds of Golden Thujas, Japanese Maples (Acers), Himalayan Rhododendrons (that had not stood the drought well), a fine weeping Lime Tree, a Himalayan Larch raised from seed given by Sir W. Hooker, Fern-leaved Beech, Sequoia, Abies grandis, Picea Lasiocarpa, P. Pindrow, and a fine Cryptomeria japonica, 40 high at least though planted in 1857, and a good specimen of Prunus Pissardi, and mention must also be made of the fact that over-ripe specimens of Beurré Gifford Pears were growing on the walls, although July had only just opened.

Entering the exhibition tent the visitor would be led to exclaim, "What a splendid show!" and so indeed it was. But an explanation is called for. The splendour was greatly due to no less than twelve large boxes of blooms cut from the Cheshunt Nurseries, and brought by Mr. G. Paul himself to help the Show, which, without these Roses, would have made a very poor comparison with former Brockham Rose Shows. Amongst his flowers were these: Mad. Pierre Cochet (an improved W. A. Richardson), Gustave Piganeau, Earl of Dufferin, Maric Magat, Waban, the new Tea (a sport of Catherine Mermet), T. B. Haywood, Dowager Duchess of Marlborough with a wonderful scent, a Cheshunt seedling, Duke of Wellington, Charles Gater, and Camille Bernardin and The Bride.

Mr. Appleby of the Boxhill Nurseries also greatly helped the Show by staging many decorative plants of Crotons, Dracænas, Palms, Gloxinias, and Ferns, and a box of very fresh Roses, in which Niphetos, Maréchal Niel, Mrs. J. Laing, Her Majesty, Earl of Dufferin, Etoile de Lyon, and A. K. Williams were conspicuous. The drought was account-

able for the comparatively poor show made by the exhibitors. Many of the sixty-four members had no Roses to cut, and some of the classes were not represented at all. Mr. Tate and Mr. Cuthell had it all their own way in the three first classes, as indeed they had last year as well. It is discouraging of course to the smaller exhibitors to see year by year this state of things, but it is a difficulty that committees seem to find it impossible to deal with.

In class 1, for twenty-four Roses, Mr. Tate was easily first, and the following Roses won for him the National Rose Society's gold medal. Xavier Olibo, Ernest Metz the best Rose in the Show; Madame G. Luizet, Rosieriste Jacobs, Charles Lamb, Her Majesty, Earl of Dufferin, Dr. Andry, La Rosiere, The Bride, Duchess of Bedford, Lady Mary Fitzwilliam, Ulrich Brunner, Anna Ollivier, Charles Lefebvre, Mrs. J. Laing, Horace Vernet, Maréchal Niel, Marie Baumann, Comtesse de Nadaillac, Beauty of Waltham, Maurice Bernardin, Francisca Kruger, and Alfred Colomb. Mr. Cuthcll took second prize (N.R.S. silver medal), with Paul Neyron, Anna Ollivier, Camille Bernardin, Susanne Marie Rodo-canachi, Xavier Olibo, Countess of Oxford, Merveille de Lyon, F. de Lesseps, Marie Finger, Beauty of Waltham, Duchesse de Morny, Etienne Levet, Comtesse de Serenye, Duke of Edinburgh, La France, E. Y. Teas, Ulrich Brunner, Mrs. J. Laing, Ed. Morren, Baroness Rothschild, Mdme. C. Joigncaux, Marie Van Houtte, Earl of Dufferin, and Lady Mary Fitzwilliam.

In Class 2, for twelve Teas, the Roses which won Mr. Tate the first prize (N.R.S. silver medal) were The Bride, Anna Ollivier, Marie Van Houtte, Hon. Ed. Gifford, Maréchal Niel, Souvenir de S. A. Prince, Francisca Kruger, Ernest Metz, Bouquet d'Or, Princess of Wales, Catherine Mermet, and Sunset. Mr. Cuthell took the bronze N.R.S. medal (second prize) with The Bride, Anna Ollivier, Marie Van Houtte, Hon. Ed. Gifford, Jules Finger, Maréchal Niel, Souvenir d'un Ami, Caroline Kuster, Perle de Jardin, Comtesse de Nadaillac, Madame Berard, and Madame Lambard.

For six triplets (class 3), Mr. Tate won first prize with Ulrich Brunner, Xavier Olibo, Mrs. J. Laing, M. Van Houtte, Etienne Levet, and Duchess of Bedford; while Mr. Cuthell took second rank with Ulrich Brunner, Comtesse d'Oxford, Jules Finger, Madame Victor Verdier, Baroness Rothschild, and Mad. G. Luizet. Now, good as these rosarians undoubtedly are, it is better, if possible, to see some variation in the record. A. 1, maiden; 2, cutback. B. 1, maiden; 2, cutback. C. 1, maiden; 2, cutback. Perhaps the Committee will be able to see their way to make some alteration in future.

For the twelves, class 4, Mrs. Perkins took first prize (N.R.S. gold medal), with a very nice box, consisting of Baroness Rothschild, Comtesse de Nadaillac, Sunset, Abel Carrière, Maréchal Niel, Madame Rady, The Bride, Mrs. J. Laing, Souvenir de Thérese Levet, Bouquet d'Or, Captain Christy, and Hon. Ed. Gifford. The Hon. D. Ryder took second prize with Duke of Teck, Paul Neyron, Madame Berard, Prince Camille de Rohan, François Duval, Reine du Midi, Madame M. Rady, Ferdinand de Lesseps, Abel Carrière, La France, Marie Baumann, and Reine Marie Henriette. There was no competition for the third prize, nor for class 5 (nine Teas), nor for class 6 (four triplets). In class 7 (six of any kind), Mrs. Hatch took first prize, the best of her blooms being Her Majesty. Mrs. Poland also had a fine bloom of the same Rose in the box which won for her the second prize.

For four Teas, class 8, Mrs. Hatch took first prize, and Miss D. A. Nesfield second prize. In the members' open class (9) for six of the same kind of Rose, Mrs. Perkins won the first prize with good blooms of Maréchal Niel, and Mr. Cuthell second prize with Gloire de Dijon. There were no competitors for the third prize. For six H.P.'s (same kind), Mrs. Poland with John Stuart Mill was first, and Mr. Cuthell with Camille Bernardin second.

The boxes of garden Roses (11) were perhaps the chief feature of the Show, for there were six competitors. The first prize was taken by Mr. Tate for a very beautifully arranged box, containing Lucida, Aimée Vibert, Fellenberg, Gloire de Polyantha, Safrano, Gloire de Rosomaine, Moschata Nivea, Cramoisie, Anna Maria Montravel, Clothilde Soupert, Homère, Crested Moss, Mrs. Bosanquet, Common China, Red Damask, Gloire de Dijon, Queen of Bedders, Boule d'Or, Souvenir de Malmaison. Mr. Cuthell's box, which took second prize, contained Bardon Job, Paul's Single White, Verdifolia, Pissardi, White Pet, Paquerette, Céline Forestier, Dr. Grill, and L'Ideal. For a smaller collection of garden Miss D. A. Nesfield took the first, Mrs. Perkins the second, and Sir Benjamin Brodie an extra third prize.

The dinner table decorations was represented by one entry only, which was Miss D. A. Nesfield. It was for unmarried ladies only. It was very well done, and consisted of a combination of centre and side green vases in wrought iron stands filled with Roses, Ferns, and flowers. The drawing-room decorations were more numerous, but not up to the usual mark. Miss D. A. Nesfield took first prize for a combination of yellow Eschscholtzia, Copper Beech, Grasses, and Ferns in a green glass vase in iron stand. Mrs. Benecke took the second prize for a basket, somewhat unevenly but tastefully arranged with Eucharis, Honeysuckle, Maize, Passiflora, Hollyhock, Gypsophila, and Ferns.

The buttonhole bouquets represented the old fashion (small size) and and the new (large size). The Judges were strong minded enough to give the first prize to Miss Blake for three very pretty small bouquets, and the second prize to Miss D. A. Nesfield for three extremely pretty but oversized new fashioned bouquets.

The best Rose in the Show was a very fine bloom of Ernest Metz, shown by Mr. Tate.—A. B. ALEXANDER.

HEREFORD.—JULY 5TH.

THE twenty-seventh anniversary of the West of England Rose Society, the oldest Rose Show in the kingdom, was held in the beautiful grounds of the Castle Green, as far as weather was concerned, under most favourable circumstances. A slight shower in the early morning gave an air of freshness, grateful both to the exhibits and exhibitors, many of whom we know have been disappointed and distressed this trying season. Last year, as many rosarians will sadly call to mind, the Hereford Rose Show was held—as at the National Rose Shows, Provincial Show at Chester two days later—in a continuous deluge of rain, which so interfered with the receipts that no praise too high can be given to the Hon. Secretary, Rev. F. R. Burnside, for his marvellous energy in not allowing the Exhibition to fall through, and in supplying a small, but as it fortunately turned out, a sufficiently attractive prize list, to gather together in Hereford the leading exhibitors of the season. May I stop, Mr. Editor, and ask here the oft put question, why Rose shows are not so popular as they might be, and theoretically ought to be, considering the unique position and popularity of our national flower? Many reasons there are and have been ventilated, perhaps all included in the great "indispensable" everywhere—" beer and skittles," which freely paraphrased practically means "none of your light refreshments: parachutes, tight and slack rope acrobatisms, &c., is what our tickets are taken for;" and undoubtedly this is the case. Have we not success at Shrewsbury, wet or fine? What further proof is wanted? Still, this is an opportunity your reporter does not like to miss in assigning another reason why the attendance at Rose shows is so poor, and Rose shows, as a consequence, so short-lived. He ventures to ask, Could not that stupendous lever of thought, word, and deed—the Public Press—do more?

Let any of your readers, for instance, take up his London daily of July 3rd. I had almost ventured to predict that the larger the circulation of that paper, the smaller, the more foggy and inaccurate the paragraph; and then, running his eye over the report of the National Rose Society's Exhibition at the Crystal l'alace, ask himself what pleasure or profit he had derived. It might be considered exacting perhaps to expect a strict technical report from any other than a gardening newspaper, but surely a more careful and detailed account might have been expected; while such gross inaccuracies as one of our leading champion Rose nurserymen, Mr. B. R. Cant, would, one would have thought of easy monosyllabic nomenclature, being advertised (for literally to tradesmen this is so), and this not once but twice, as "Caul." To use a slang phrase (it altogether seems so droll), really "takes the cake." I could mention in same report several similar inaccuracies, but "Ex uno disce omnes." Liberari meum animum. This surely is not the way to educate the public, or to encourage a most popular (aye, in

spite of seeming failure) but expensive industry.

Asking pardon for this long digression, your reporter must at once return to the magnificent tent, capable of holding the thousands of Rose boxes, which alas I were conspicuous only by their absence. To remedy this deficiency, the wily Hon. Sec. (Rev. F. R. Burnside) introduced a new departure (one quite fashionable among prandial bipeds), in breaking up the usual continuity of the tables into detached groups, thereby filling the entire space, without interfering with or giving extra

trouble to the Judges. As might have been expected, owing to the early and dry season, the northern exhibitors (all honour to them for so well filling the gap) carried off all the chief prizes in the three leading nurserymen's classes, the third prize not being competed for. In Messrs. Harkness & Co.'s seventy-two varicties, which took first prize, there was a conspicuous absence of Teas and Noisettes. Their blooms were wonderfully smooth, well coloured, and of fair size for the season, and had carried extremely well. They included the following varieties of H.P.'s—Gustave Piganeau (grand bloom but weakly habit), Madame E. Verdier, Général Jacqueminot (fine colour and shape), Marie Baumann, Emily Soupert, Duke of Fife, Duchesse de Morny, Countess of Oxford, Senateur Vaisse (splendid), La France, Dr. Andry, Mrs. Harkness (poor), Duke of Teck (radiant, as one might suppose), Marie Rady (superb), A. K. Williams, Suzanne Marie Rodocanachi (useful), Horace Vernet, Silver Queen, Comtesse de Ludre (after Mrs. C. Wood, very fine). Noisettes: Caroline Kuster, Charles Lefebvre, Countess of Rosebery, Reynolds Hole, Emily Hausburg, Jean Soupert, Madame Hausman, Mrs. John Laing (grand), Alfred Dumesnil, Alfred Colomb, Rosieriste Jacobs (fine), Comte de Blaccas (a globular too much alike Emilie Hausburg), Duke of Conseventy-two varieties, which took first prize, there was a conspicuous Blaccas (a globular too much alike Emilie Hausburg), Duke of Connaught, Fisher Holmes, Pride of Waltham, Harrison Weir (grand), Charles Darwin, Lady Helen Stewart, Constantine Petriakoff (superb), Auguste Rigotard, Earl of Dufferin (grand), Black Prince, Margaret Boudet, Duchess of Bedford (exquisite), Queen of Queens, John Saul, May Quennel (fine), Elie Morrel, Dr. Sewell, Merveille de Lyon, W. F. Bennett, Le Havre (good), Ulrich Brunner, François Michelon, Xavier Olibo, Capt. Christy, Dupuy Jamain, Viscountess Folkestone (grand), Madame E. Verdier, Heinrich Schultheis, Mons. E. Y. Teas, Duc de Montpensier, Duchess of Albany, Gloire de Margottin (fine), Mr. George Dickson, Sir Rowland Hill, Magna Charta (good), Avocat Duvivier, and Marie Verdier. The second prize was taken by the English Fruit and Rose Company, Limited, (Cranstons), who had fine blooms of Duke of Wellington, Tea Souvenir d'Elise, and Her Majesty. The thirty-six trebles fell to Messrs. Mack & Sons, Yorkshire, whose varieties included H.P. Charles Lefebyre, Merveille de Lyon, Rosieriste Jacobs, Mrs. John Laing (fine). Lefebvre, Merveille de Lyon, Rosieriste Jacobs, Mrs. John Laing (fine), Ulrich Brunner (magnificent), S. M. Rodocanachi (superb), Pride of Waltham, A. K. Williams, Baroness Rothschild, Dupuy Jamain, Princess Beatrice, Star of Waltham, Marquise Castellane, Duke of Teck, Marguerite

de St. Amand, Louis Corbie (Mr. Mack speaks very highly of this old Rose), Victo Hugo (good), Magna Charta, Alfred Colomb, Comtesse de Morny, Comte de Raimbaud (grand), La France, Duke of Wellington (good), Countess of Rosebery, Marie Baumann. Heinrich Schultheis, Sultan of Zanzibar (splendd colour). Madame Gabriel Luizet, Etienne Lavet Charles Darwin (good). Levet, Charles Darwin (good), E. Y. Teas (fine), and Sir Rowland Hill. The second prize was taken by the English Fruit and Rose Company, Limited (Cranstons), who had remarkably fine blooms of Général Jacqueminot, Abel Carriere, and Lady Sheffield.

The twenty-four trebles first prize also fell to Messrs. Harkness with grand blooms of H.P.'s Etienne Levet, Mrs. John Laing, Duchesse de Morny, Prince Arthur, Mdme. Isaac Pereirc (superb), Alfred Colomb (grand), Sir R. Hill, Elie Morel, Mons. E. Y. Teas (splendid), M. Boudet, Dupuy Jamain, Merveille de Lyon (grand), Duke of Wellington, Violette Bowyer, Mdme. Haussmann, La France, Maric Bauman, and Heinrich Schultheis. The second prize fell to the Fruit and Rose Company, Limited (Cranston). The third to Mr. C. Whiting White Crass Hereford

Whiting, White Cross, Hereford.

For twelve varieties trebles, Messrs. Mack & Sons, Yorkshire, were first, showing finely the following varieties:—H.P. Horace Vernet (splendid), La France, A. K. Williams, Mrs. John Laing, Victor Hugo (superb), Merveille de Lyon, Alfred Colomb, Mdme. S. Rodocanachi (very fine), Charles Lefebvre, Auguste Rigotard, Baroness Rothschild, Prince Arthur (grand). Second prize, Mr. H. Merryweather; third prize, Mr. Charles Whiting Mr. Charles Whiting.

In the amateur division first prize fell to Mr. Drew, Ledbury, thirtysix varieties, who also won one the N.R. Society's silver medal, among which may be specially noticed H.P. Dupuy Jamain (grand), S. M. Rodowhich may be specially noticed H.F. Dupuy Jamain (grand), S. M. Rodo-canachi, Charles Lefebvre, Merveille de Lyon, Ulrich Brunner, A. K. Williams (fine), Gustave Piganeau (superb), Beauty of Waltham, Mrs. J. Laing, Marie Baumann, Etienne Levet, Comte Raimbaud, Captain Christy, Countess of Oxford (splendid), Violette Bouyer, E. Y. Teas, Le Havre, François Michelon, Prince Arthur (good), Queen of Queens, Victor Hugo, Marie Verdier, Pierre Notting, and Heinrich Schultheis. No other competitor. In the amateur class restricted to Herefordshire the first prize (eighteen varieties), which included the N.R.S.'s gold medal, was taken by Mr. John Ough, with blooms very fresh and well set up, as follows:—H.P. Louis Van Houtte, Gustave Piganeau (grand), Her Majesty (not her year), Duke of Welllington, Merveille de Lyon, S. Rodocanachi, Comtesse de Serenye, Earl of Dufferin, A. K. Williams (fine), Countess of Oxford, Exposition de Brie (grand), Baroness Rothschild, Marie Baumann, Marchioness of Dufferin, Tea The Bride, H.P. Marie Rady (grand), Mrs. John Laing, and Alfred Colomb.

Teas and Noisettes were shown remarkably well considering the Messrs. Harkness & Sons continued their list of first prizes with an excellent stand of eighteen varieties open, which included Thérèse Levet (bright and not too dark), Marie Van Houtte, Souvenir d'un Ami, Catherine Mermet, Comtesse de Nadaillac (fine in size and colour), Madame Bravy, Etoile de Lyon, Innocente Pirola, Madame Hypolyte Jamain, Francisca Kruger (fine), Miss Caroline Kuster, Jean Ducher, Souvenir de S. A. Prince, Souvenir d'Elise (superb), Madame de Watteville, The Bride, Princess of Wales, and Madame Cusin. Second prize,

Messrs. Mack; third prize, Mr. H. Merryweather.
In the amateur class for Teas and Noisettes, first prize (given by Mr.

Frank Cant), Mr. Conway Jones.

The prizes for twelve blooms of any light Rose was carried off by Messrs. Harkness with grand blooms of Merveille de Lyon; second, English Fruit and Rose Company (Cranston); third, Messrs. Mack and Son. For twelve blooms of any sort of dark Rose, first prize, Messrs. Mack, with H.P. Marie Baumann; second, Messrs. Harkness; third, English Fruit and Rose Company (Cranston).

The class for herbaceous flowers was keenly contested, the number of varieties staged, and good taste shown in staging, being very noticeable. First prize, Mr. Davenport, Foxley; second prize, Mr. Watkins, Welcroft; third prize, Sir George Cornwall, Bart., Moccas Court. The table decorations were much admired and thus awarded. First, Miss Watkins; second, Mrs. Blashill; third, Miss Stanhope. Thanks are due to numerous friends, and especially to Mr. Charles Whiting, Whitecross Nurseries, for collections of stove and greenhouse plants to decorate the tents. One great feature in the Exhibition, and last, but not least, was the large and charming collections of Sweet Peas and Violas exhibited and arranged as to colour and general effect by Mr. Jones, manager to Messrs. Dobbie & Son, Rothesay. It is worthy of mention that one of the Violas (Violetta) was exquisitely sweet-scented. The Judges were the Rev. C. H. Bulmer, Mr. John Cranston, Mr. Harkness, and Mr. W. Drew.—THE HEREFORDSHIRE INCUMBENT.

IPSWICH.—JULY 5TH AND 6TH.

THE extremely few members of Ipswich Horticultural Society who are interested in Roses were naturally sorry that it was decided to hold a two-days Show, and that they could not therefore enjoy the countenance of the N.R.S.; but they were in a most hopeless minority, and were grateful for being allowed to show Roses at all, and that the first day at least did not clash with any other East Anglian show. The Show was held, as usual, in Christ Church Park, but the spot chosen seemed unnecessarily near to the uninhabited house, which gave a somewhat melancholy air to the surroundings. Competition was not strong in the

Rose classes, and the standard of merit was low.

In the class for thirty-six (open) Mr. F. Cant was first, having a very good stand, of which Mrs. John Laing was again his most noticeable bloom. Messrs. D. Prior & Sons were second, having a very

fine Horace Vernet and a neat bloom of Ella Gordon. Mr. Woods of Woodbridge was third. In the class for twelve trebles (open) the judging showed a very good example of deciding equal point merits by arrangement and general appearance. Messrs. Prior & Sons and F. Cant were absolutely equal in points, but the former's stand was so decidedly superior in arrangement, evenness, and general beauty as to be held quite worthy of the additional point necessary to a win. A fine triplet of Marechal Niel in the stand of Messrs. Prior contributed to this result. In twelve Teas (open) Messrs. Prior were first and F. Cant second, the exhibits being only fair.

In thirty-six Roses (amateurs), Rev. A. Foster-Melliar's was the only exhibit; the blooms were but moderate. In twenty-four Rev. H. A. Berners was first, and Mr. Orpen, of Colchester, second with a poor stand. In twelve, Mr. Parsons of Woodbridge won with a very promising stand, having Marie Van Houtte and Maréchal Niel in good condition. Mr. Berners was second, and Mr. Orpen third. In twelve Teas Mr. Berners was first, Mr. Orpen second, and Mr. Foster-Mollion thind. In the three firsts and thind the poor to the latest the description of the latest the description. Melliar third. In the first and third stands most of the blooms had already done duty at Diss. In six Roses of any sort Mr. Orpen was first with fine Maréchal Niels, Mr. Parsons second with Mrs. J. Laing, and Mr. Parsons third with Medama Cabriel Luizet. Mr. Berners third with Madame Gabriel Luizet.

The local classes were only fair. In three classes for bouquets and buttonholes Mrs. Orpen was, as usual, invincible, and indeed seems to have frightened away other competitors. In the decoration of wild flowers with Grasses Miss O. E. Jennings won easily, having the only

light arrangement. Table decorations call for no comment. In groups, Mr. J. H. Southgate, gardener to Mr. Whitfield King, was a very good first, as it was not easy to find fault with his exhibit. Mr. Jacobi, of Ipswich, showed herbaceous plants well. The weather was glorious, and it is to be hoped that the funds profited accordingly.

NORWICH .- JULY 6TH.

THE extremely flourishing Norfolk and Norwich Horticultural Society had the good fortune not only of a cloudless day, but also of having chosen last year the Royal wedding day as the date of their Show. There was one confiding amateur who journeyed to Norwich with thirty-six blooms, cut the same day as another thirty-six for Ipswich, in the full expectation that he would be unopposed at Norwich for the principal amateur prize of the eastern counties. The place chosen was "Mouseholes," the seat of J. Poyser, Esq., and the tents were pitched in a pretty hollow, but oh! such a hot spot. There was some shade at a distance from the Rose tent, and thither wended the confident one to find in possession a genuine Norfolk amateur, who seldom exhibits largely, with boxes upon boxes literally overflowing with fine Roses. When it is stated that this gentleman actually set up and exhibited of his superabundance on July 6th, 1893, an extra stand of thirty-six really fine samples of Baroness Rothschild, it may be imagined that the amateur first mentioned not only speedily lost all traces of his former self-confidence but began to wonder uneasily if he had ever been heard to say that there were no strong Rose amateurs in Norfolk proper.

In the class for forty-eight, open, Mr. B. R. Cant was first with fine large blooms, though somewhat rough and dirty. His best blooms were Her Majesty, and a small but charming example of Ethel Brownlow; Marchioness of Dufferin was dirty and bad, as it has generally been this year. Messrs. Burch of Peterborough were second with smaller, but cleaner and neater blooms. They had Horace Vernet very fine, but this specimen again was absolutely unshaded with a darker tint as usual. Messrs. Prior of Colchester were third with an inferior stand. In eighteen trebles, open, Mr. B. Cant was again first, and Messrs. Prior second. The latter's stand was rather crowded, but this must have been rather a near thing. Messrs. Prior third with a high coloured triplet of

Jean Ducher.

In thirty-six blooms (amateurs) Rev. A. L. Fellowes, of Beighton Rectory, was first, his blooms being large and heavy though rather overblown and not exhibited to the best advantage. His best bloom was Emilie Hausberg, which has been good this year; this gained the medal as the best amateur H.P. Baroness Rothschild was also good, and he had also originally two wonderful Teas, Anna Ollivicr and Marie Van Houtte, but these promptly succumbed under canvas. Rev. A. Foster-Mellier of Sproughton was a close second (three points), Thomas Mills (!) being perhaps his best. Miss Penrice of Witton was third. In twelve Rev. A. Fostertrebles (amateurs) Rev. A. Foster-Melliar was placed first, alternate triplets of H.P.'s and Teas having a good effect. Gustave Piganeau and Comtesse de Nadaillac were his best. Rev. A. L. Fellowes was second, showing nothing but H.P.'s placed in rows. In the class for twenty-four, Rev. A. L. Fellowes was again first, Mr. T. C. Blofeld second, and Rev. F. Page Roberts third.

In local classes, which were well filled and contested, the medal Tea was found in a badly shown Maréchal Niel in the six of Mrs. Amys Lyde. In the class for twelve Teas Rev. F. Page Roberts was first with very small blooms, but shown with his usual skill; Rev. A. Foster-Melliar second; and Rev. A. L. Fellowes third.

For twelve Roscs of a sort, Rev. A. L. Fellowcs left his rivals out of sight with La France and Comtesse de Nadaillac respectively. In six of a sort the samples were bad, and somebody was ashamed of his two winning stands. Colonel Rous exhibited as an extra twenty-four Maréchal Niels of fair quality, and the extraordinary stand of thirty-six Baroness Bethackilds shows by Box A. T. Fellows six Baroness Rothschilds, shown by Rev. A. L. Fellowes, was not honoured as it should have been with an extra prize. This honour was, however, awarded to a large exhibit of garden Roses and Polyanthus by the same gentleman.

Mr. John Green of Dereham had a pretty general stand, Reynolds Hole Carnation and a variegated Saxifrage being among the most noteworthy of his exhibits. Messrs. Daniels Bros. had also a large stand, Gloxinias and Begonias being conspicuous. Gloxinias were finely shown by H. Trevor, Esq., and the fruit was good. To genuine florists, however, perhaps the most notable exhibit was the seedling Picotees and Pinks shown by Rev. C. Fellowes of Shottesham. Twelve of each were shown, many of them unnamed, and a large proportion, of the Picotees especially, was considered by experts to be of very high merit.—W. R. RAILLEM.

BATH .-- JULY 6TH.

As a rule the Rose shows at Bath are both extensive and high-class, most of the leading rosarians in the country competing. This year there was, owing to the drought, a great falling off in the number of exhibits, but all things considered the reputation of the Society has not suffered. It is also most gratifying to note that for once their proverbial misfortune as regards the weather was changed, a "Royal" day being experienced, and the finances of the Society will be improved accordingly.

There were two competitors in the nurserymen's class for seventy-two single trusses of Roses, distinct, Messrs. Harkness & Son, Bedale, being first with a collection that would have been hard to beat, even in a more favourable season. Of these the best were Comtesse de Ludre, Duchesse de Morny, Susanne Marie Rodocanachi, Beauty of Waltham, Marie Baumann, Ulrich Brunner, Gustave Rousseau, Rosieriste Jacobs, Marie Rady, Madame Victor Verdier, A. K. Williams, Mrs. J. Laing, Countess of Oxford, Madame C. Wood, Fisher Holmes, Général Jacqueminot, Lady Mary Fitzwilliam, Edward Andry, Margaret Dickson, Prince Arthur, Margaret Bondet, Earl of Dufferin, Charles Lefebvre, Elise Morel, Xavier Olibo, Comte de Raimbaud, Exposition de Brie, Le Havre, Countess of Rosebery, Lord Macaulay, Alfred Colomb, Sir Rowland Hill, Crown Prince, Etienne Levet, Captain Christy, Reynolds Hole, Madame H. Jamain, Camille Bernardin, Magna Charta, Grand Mogul, La France, Merrie England, May Quennell, Mons. Noman, Madame V. Verdier, Madame Gabriel Luizet, Marquise de Castellane, Duke of Connaught, and Madame J. Perriere. Messrs. Cooling & Son, Bath, were a very creditable second, having good fresh blooms of Alfred Colomb, A. K. Williams, Merveille de Lyon, a seedling of the same character as the latter, but much fuller, Pierre Notting, George Baker, Harrison Weir, Duchess of Bedford, E. Y. Teas, Gustave Piganeau, Lord Bacon. Horace Vernet, and Dupuy Jamain.

Lord Bacon, Horace Vernct, and Dupuy Jamain.

Messrs. Harkness & Sons were also well first with thirty-six triplets, and which comprised fine fresh blooms of Etienne Levet, A. Colomb, A. K. Williams, Prince Arthur, Madame E. Verdier, Mrs. J. Laing, Madame Haussman, Comtesse de Ludre, Duke of Wellington, Countess of Rosebery, Dupuy Jamain, Gustave Piganeau, Reynolds Hole, Marie Baumann, and Exposition de Brie. Messrs. Cooling & Son were second, they also showing well. With eighteen triplets Mr. G. Mount, Canterbury, was first, such varieties as Mrs. J. Laing, Ulrich Brunner, Prince Arthur, Géneral Jacqueminot, Fisher Holmes, Abel Carriere, and Dupuy Jamain being the best in his stands. The second prize went to Mr. J. Mattock, Oxford, who had good blooms of Lady Sheffield, Madame J. Laing, C. Lefebvre, Mons. E. Y. Teas, and Pierre Notting. The first prize for thirty-six single trusses, distinct, was well won by Mr. Mount, this being one of the best exhibits in the Show. Very fresh and good were Général Jacqueminot, Mrs. J. Laing, Dupuy Jamain, A. K. Williams, Earl of Dufferin, Duke of Wellington, Marie Rady, C. Darwin, Countess of Rosebery, Fisher Holmes, Eugène Fürst, Madame Vietor Verdier, John Bright, Alfred Colomb, Marie Baumann, and Louis Van Houtte. Mr. J. Mattock was again second, his best being Earl of Dufferin, Mrs. J. Laing, Marie Baumann, Marie Rady, and Xavier Olibo.

Houtte. Mr. J. Mattock was again second, his best being Earl of Dufferin, Mrs. J. Laing, Marie Baumann, Maric Rady, and Xavier Olibo.

There was good competition in the class for eighteen Teas or Noisettes, Messrs. Harkness & Son winning first prize with a very superior stand, which comprised Cleopatra, to which was awarded a silver medal of N.R.S., Madame H. Jamain, Souvenir d'un Ami, Madame Hoste, Comte de Nadaillac, Souvenir de S. A. Prince, Ernest Metz, The Bride, Madame de Watteville, Souvenir d'Elise, Francisca Kruger, Caroline Kuster, Thérèse Levet, Hon. E. Gifford, Catherine Mermet, Innocente Pirola, and Madame Bravy. Mr. G. Mount was a creditable second, his best being Niphetos, The Bride, Souvenir d'un Ami, Souvenir d'Elise Vardon, and Maréchal Niel, the latter being thought by many fully deserving of the medal which went to the bloom of Cleopatra already noticed. Mr. J. Mattock was third.

Amateurs' classes were badly filled, Mr. S. P. Budd having matters very much to himself. This gentleman's exhibit of thirty-six varieties, single trusses, fully deserved the award of a first prize, being very considerably better than he expected to cut two days prior to the Show. The best were Charles Lefebvre, Sultan of Zanzibar, François Michelon, E. Y. Teas, Marie Van Houtte, Sir Garnet Wolseley, S. M. Rodocanachi, Horace Vernet, Ernest Metz, A. K. Williams, Madame Vietor Verdier, Le Havre, Reynolds Hole, Marie Baumann and Longfellow: With cighteen varieties, triplets, Mr. S. P. Budd was again first. For twenty-four single blooms, distinct, Mr. H. Hobbs, Bristol, was well first, his stand comprising good Auguste Rigotard, Horace Vernet, Mons. Bonsteten, Mrs. J. Laing, A. Colomb, Dr. Andre, Prince Arthur, Camille Bernardin, Captain Christy, and E. Y. Teas. Mr. J. Parker, Headington, was second, his most noteworthy blooms being Senateur Vaisse, Marie Baumann, Eclaire, and Horace Vernet. With twelve blooms Mr. J. Parker was first, Mr. T. Hobbs second, and Mr. R. Hull, Sutton Benger, third. The first prize for twelve triplets went to Mr. T. Hobbs. The best eighteen Teas was shown by Mr. S. P. Budd, among these being very creditable blooms. Mr. A. H. Gray, Bath, was second. With twelve varieties Mr. J. Parker was first. Mr. T. Hobbs

second. Mr. S. P. Budd was easily first with six triplets, Mr. J. Parker being second and Mr. A. H. Gray third.

Some of the open classes were very well filled, this being especially the case in that for twelve trusses of any Rose. Messrs. Harkness and Son had a grand stand of Mrs. J. Laing, a bloom among these being selected for the award of National Rose Society's silver medal for the best Hybrid Perpetual in the Show. Mr. J. Mattock was a good second with the same variety. Mr. J. Mount was first with any yellow Rose, having a good stand of Maréchal Niel, Mr. A. H. Gray was second. A fine stand of Gustave Piganeau gained Messrs. Harkness the premier award for the best crimson Rose, Mr. G. Mount being second with Fisher Holmes. Prizes were also offered for twelve distinct garden decorative Roses in bunches, and with these Messrs. G. Cooling & Son were well first, staging fine bunches of Aimie Vibert, Madame Bruant, Princess de Nassau, Madame Lambard, Fellemberg, York Rose, Cheshunt Scarlet, Single Perpetual White, Triomphe de Noisette, Madame Bravy, Pappilon, and Souvenir de la Malmaison. Local classes were not well filled, the most noteworthy exhibit in these being the stand of thirty-six varieties, single trusses, that gained Mr. A. H. Gray a gold medal.

The competition in the class for nine bouquets of Roses was close, Mr. J. Mattock being first, Messrs. G. Cooling & Son second, and Mr. J. Bradbury third, all showing well. Very good also were the exhibits of hardy herbaceous flowers in bunches. Mr. F. Hooper, Widcombe, was a good first, and Mr. A. A. Walters, Bath, second. With twenty-four bunches hardy annuals Mr. A. F. Newman, Bath, was well first, the second prize going to Mr. F. Hooper. Mr. R. B. Cater had a first prize for a pretty basket of Orchids, Mr. A. F. Newman being a creditable second in the same class.

Good prizes were offered for a group of miscellaneous plants arranged for effect on a space not exceeding 200 square feet. Mr. J. Cypher, Cheltenham, was well first for a very light and tasteful arrangement, Messrs. Cooling & Son being second, and Mr. T. J. Tate, gardener to W. Pumphrey, Esq., Bath, third. Mr. Cypher was also first for fine-foliaged plants. A fairly large tent was principally devoted to Tuberous Begonias, a fine display of these being made. The silver cup, value £5 5s., offered by the Rev. E. Lascelles, a famous local raiser of Begonias, for twelve plants was well won by Mr. J. B. Blackmore, Tiverton, who had grand plants; Mr. Blackmore also took the lead in several other classes, showing remarkably well in each instance. Other successful exhibitors were Mr. W. Bees, gardener to D. S. Carr, Esq., Tiverton; and Mr. E. Dagger, gardener to Mrs. Simms. Messrs. Blackmore and T. Wilkins, Blandford, were the most successful with cut blooms, the last named taking one of the special prizes offered by Mr. B. R. Davis, Begonia grower, Yeovil.

Non-competitors' exhibits comprised a grand display of Tuberous Begonias in a cut state by Mr. B. R. Davis, the varieties, both single and double, being very superior. Messrs. Cannell & Sons, Swanley, also showed Tuberous Begonias in fine style, their doubles being particularly good. Very attractive were the Sweet Peas and bedding Violas in bunches with a background of black velvet, Pansies and Marigolds brought from Scotland by Messrs. Dobbie & Co., Rothesay. Carnations were extensively and well shown by Mr. F. Hooper. Certificates of

merit were awarded to all these exhibits.

FARNINGHAM.—JULY 6TH.

THE fifteenth annual Show of the Farningham Rose and Horticultural Society was held on the above date. The Rose classes were not very well filled, doubtless owing to what was, considering the season, a late date, but possibly owing a little to the Royal wedding. However, the Exhibition as a whole was a good and attractive one. General Edwards is the Hon. Secretary and was able to show a good balance in his last financial statement, so that the Society may be considered to be on a firm footing.

Two competed in class 1, which was for thirty-six varieties, and Mr. Mount was placed first for an excellent stand, in which Comtesse de Nadaillac, Duke of Wellington, and Eugène Fürst, were the best of an even and well coloured collection. Colonel Pitt, Turkey Court, Maidstone, was second with a fair box, in which Marie Rady was far the best bloom. Le Havre was also very good. The remainder were a little uneven in merit, but the stand was a good one considering the season: The Colonel has shown consistently well this season. The same result was apparent in the class for eighteen Teas and Noisettes. Mr. Mount had a charming box, although Souvenir de S. A. Prince was terribly blown and weakened it considerably. The best flowers were Souvenir d'un Ami, Niphetos, Comtesse de Nadaillac, and Madame Cusin, but all were good with the exception of the one first named. Colonel Pitt's flowers were much smaller, but clean and fairly fresh.

In the amateurs' class for twenty-four Colonel Pitt won somewhat easily, although several of his flowers were very weak. A splendid Marie Rady, which was awarded a silver-gilt medal as the best H.P. in the Show, a fine Horace Vernet, and good examples of Ulrich Brunner and Madame Victor Verdier retrieved the position, and secured the award. Dr. Tucker, The Limes, Swanley Junction, was second with much smaller but fresh flowers; and R. L. Knight, Esq., Sittingbourne, was third. Dr. Tucker was victorious with twelve Teas. His flowers were very small, but otherwise they were good, Comtesse de Nadaillac, Niphetos, and Marie Van Houtte being charming blooms. Colonel Pitt had larger flowers, but one or two were well past their best, and lost points. The latter appeared to be the only exhibitor of six trebles, and received the second prize, his stand being somewhat weak. Mr. Gibson, gardener to T. F. Burnaby Atkins, Esq., was the only exhibitor of six of one

variety (light), and received a third prize for a moderate box of Niphetos.

In the third division the first prize for twelve blooms went to C. J. Grahame, Esq., Croydon, who had a fairly good stand, Fisher Holmes and Dr. Andry being the best flowers. Mr. Gibson was second, receiving a special bronze medal for A. K. Williams, and Mr. R. Edwards, The Gardens, Beechy Lees, Otford, was third. Mr. Grahame had a very neat stand of nine Teas, the flowers being clean and fresh, if small. The silver medal was awarded to his bloom of Comtesse de Nadaillac. Dr. Tucker was second. Mr. Barber, gardener to J. H. Dalton, Esq., The Oaks, Chislehurst, won with six; Mr. Couchman, gardener to A. Lanceley, Esq., Farningham, being second.

Pansies and cut flowers generally formed a bright display. Dr. Ashurst was first with twelve of the former, Mr. Gibson being second, and T. Denne, Esq., Wilmington, third. Mr. Gibson had the best box of cut flowers, and an excellent one it was, doing him great credit. Mr. Edwards was second; Mr. Dunster, gardener to the Rev. J. Williamson, third, and Mr. Barber fourth. Some very tastefully arranged vases, baskets, &c., were exhibited by Miss Solomon, Miss K. Smith, Miss Wood, Miss Hodsoll, Miss Rita Jameson, Miss Edwards, Miss F. Smith, Miss N. E. Solomon, Miss Emily Solomon, Miss Dalton, Miss K. Hodson, Miss Ashurst, Miss Sybil Edwards, Miss E. E. Smith, Miss Agnes Solomon, and Miss Maynard, all of whom received prizes.

Table plants were extremely well shown by Mr. Edwards, Mr. Gibson, and Mr. Potter, gardener to Sir Mark Collett, Bart., St. Clere, Kemsing, Sevenoaks, who were first, second, and third in the order of their names. Groups of plants were good, Mr. J. D. Abbott, gardener to Sir W. Hart Dyke, being first; Mr. T. Abbott, gardener to W. Moore, Esq., second; and Mr. Gibson third. The prizes for Ferns went to Mr. Barber and Mr. T. Abbott; and those for stove and greenhouse plants to Messrs. Gibson, Edwards, and Potter. Colonel Pitt took the lead with Grapes, his bunches being excellent both in the white and black classes. Messrs. Potter, Winnill, and Edwards received the minor prizes. Mr. Potter won with a Melon. There was an extensive and good display of vegetables. Mr. Edwards was first with twelve varieties, Mr. Winnill with nine, and Mr. Baldwin, gardener to J. C. Crossley, Esq., with six, the latter being for Messrs. Sutton's prizes. Mr. T. Abbott and Mr. Nicol were also prizewinners. Mr. T. Abbott had the best Cueumbers, and Mr. Baldwin the best Tomatoes. The first prize for a table went to Mr. J. D. Abbott.

Messrs. H. Cannell & Sons had an interesting collection of Caetaceous plants, together with some beautiful Begonias and Gloxinias. They also

had a large and fine mixed group of plants.

WOLVERHAMPTON.—JULY 11TH.

CONSIDERING the season there was a surprisingly good display of Roses at Wolverhampton on the above date. It is true several of the blooms were more or less faded, and more appeared to have been injured by wind and rain, still excellent collections were staged by northern growers. In the class for seventy-two olooms, distinct, the first and second prizes of £7 10s. and 5 guineas, given by the Mayor of the town, C. T. Mander, Esq., were won by Messrs. Harkness & Sons, Bedale, and R. Mack & Sons, Catterick Bridge, respectively, Messrs. Merryweather & Son, Southwell, being third.

With forty-eight blooms, distinct, Messrs. Mack & Son were first with a really fine collection, Messrs. Harkness and Merryweather showing well for the remaining prizes, which they won in the order of their names. In the thirty-six bloom class Messrs. Harkness & Sons won the premier position, Messrs. Merryweather being second, and Perkins and Son third in good competition. In the twenty-four bloom class the Bedale firm were again to the fore, second honours going to Southwell,

and third to Hereford—the English Fruit and Rose Company.

Messrs. Merryweather were the premier exhibitors of new Roses. In the class for twelve dark Roses Messrs. Mack & Son were first with Horace Vernet, Harkness & Sons second with Alfred Colomb, and D. & W. Croll, Dundee, third with Maurice Bernardin. A good class. The light bloom class brought out probably the finest stand ever seen of Merveille de Lyon. Mr. Pemberton, one of the Judges, remarked the stand contained "six silver medal blooms." It was certainly a splendid stand, and will not soon be forgotten. Messrs. Perkins & Son were second, and the Hereford Roses third, both stands Mrs. J. Laing. The winners in the open class with Teas were Messrs. Croll, Merryweather, and Townsend, but all the blooms were injured by the weather.

In the gardeners' and amateurs' class for thirty-six blooms the prizes were won by Messrs. Budd (Bath), Pemberton (Havering), and Robins (Wolverhampton) in the order named, with very good collections. Mr. Budd was first with twelve Teas, the best stand of these Roses in the

Show

A large general Exhibition was held at the same time, but cannot be further referred to this week. Rain fell in torrents at intervals on the opening day, and must have prejudiced the attendance of visitors

EARL'S COURT.—JULY 12TH.

DESPITE the heavy fall of rain on the preceding evening there was a fair display of Roses, Carnations, and other flowers at the Gardening and Forestry Exhibition at Earl's Court on Wednesday, July 12th. Fruit was also shown in grand condition, the Grapes being specially fine.

Carnations were very good, especially those shown by Mr. M. Rowan, Clapham, who was awarded the first prize for twenty-four blooms. The best of these were Rob Roy, George Melville, John Buxton, and W. Skirving. Mr. C. Turner, Royal Nurseries, Slough, was a close

second with a stand of bright flowers. The third prize went to Mr. J. Douglas, Great Gearies, Ilford. Mr. G. Chaundy, New Marston, Oxford, secured the leading award for twelve Carnations, showing fresh and brightly coloured flowers. The second prize in this class went to Mr. F. Hooper, Widcombe, Bath, for a stand of good blooms; Mr. A. J. Sanders, gardener to Viscountess Chewton, Bookham Lodge, Cobham, being third. There were only three competitors in each of the

Mr. C. Turner secured the premier honours in the class for twenty-four Picotees, showing grand flowers. The best were Mrs. S. Beal, John Archer, Morna, Madeline, Favourite, and Brunette. Mr. Douglas was second, and Mr. M. Rowan third. In both cases good flowers were staged. There were only three competitors in the class last mentioned. Of twelve Picotees there were four exhibitors, and the competition was somewhat keen. Mr. F. Hooper, however, gained the premier prize for a stand of fresh flowers. Mr. G. Chaundy was a good second, and Mr.

A. J. Sanders third.

There were nine exhibitors of twelve self and Fancy Carnations, and consequently the first prize, which went to Mr. J. Walker, Thame, was well won. The flowers were very good, especially Alfred Grey, Duchess of Portland, and Rose Unique. Mr. Rowan was a close second, Mr. G. Chaundy being third. Mr. J. Douglas won with twelve yellow ground Picotees, staging splendid flowers. Mr. C. Turner was second, and Mr. Chaundy third. Mr. T. Anstiss, Brill, gained a first-class certificate for Carnation Mrs. Anstiss, a grand apricot-coloured self. Mr. C. Turner was again first for twenty-four self and Fancy Carnations, Mr. J. Douglas being second, and Mr. A. Smith, Downley, High Wycombe, Bucks, third.

Mr. G. Wythes, gardener to Duke of Northumberland, Syon House, sent a collection of border Carnations, not for competition (silver medal). Messrs. G. Paul & Son, Cheshunt, also had some Carnations. A box of new dwarf Cannas were likewise sent by Messrs. Paul, to whom a silver medal was awarded for their various exhibits. Mr. J. Walker, Thame,

secured a silver medal for a collection of border Carnations.

Mr. Chas. Turner, Royal Nurseries, Slough, gained the first prize in the class for forty-eight distinct Roses, three trusses of each. The best were Prince Arthur, Maréchal Niel, Crimson Rambler, A. K. Williams, and Louis Van Houtte. The first prize and silver medal in the class for forty-eight Roses, distinct, single trusses, was awarded to Messrs. Paul & Son, Old Nurseries, Cheshunt, who staged A. K. Williams, Alfred Colomb, Ernest Metz, Madame Gabriel Luizet, La France, and Her Majesty in good form. In the class for twenty-four Roses distinct three trusses of each Messrs. In the class for twenty-four Roses, distinct, three trusses of each, Messrs. Prior & Son took the premier position, with Mr. Geo. Mount a close second. Mary Bennett, Jean Ducher, Queen of Queens, Lady Sheffield, Souvenir de la Malmaison, and Catherine Mermet were amongst Messrs. Prior's best. Messrs. D. Prior & Son gained the first prize for twentyfour distinct Roses. Horace Vernet, Ulrich Brunner, Anna Ollivier, and Chas. Lefebvre were amongst the best. Mr. G. Mount was a very close second. Messrs. D. Prior & Son, Colchester, were the only competitors in the class for twenty-four Teas or Noisettes, and the first was accorded to them. The stand included Madame Willermoz, Edith Giffard, Perle des Jardins, Madame Lambard, and Jean Ducher in grand form. Mr. G. Mount, Canterbury, was awarded the first prize for eighteen Tea or Noisette Roses, distinct, showing, amongst others, Hon. Edith Gifford, Catherine Mermet, Innocente Pirola in fine form. Messrs. Paul & Son were awarded the first prize and a silver medal for twentyfour bunches of garden Roses, staging a beautiful collection. Mr. A. Gibson, gardener to T. F. Burnaby Atkins, Esq., Halstead Place, Sevenoaks, was awarded an extra prize for a ereditable box of twelve bunches of garden Roses. Mr. Gibson was again first for twelve distinct Hybrid Perpetual Roses, Mr. Jas. Parker, Oakfield, Hitchin, being second, and Miss E. Bailey Denton, Orchard Court, Stevenage, third. Mr. Jas. Parker was awarded the first prize for twelve Tea or Noisette Roser in distinct varieties staged a good selection. Messrs. Gco. Jackman, Woking, staged a large collection of Roses not for competition (silver medal).

Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton, staged a very fine magnificent group of foliage plants. Dracenas, Ferns, Crotons, Palms, Caladiums, and Isolepis gracilis were amongst the most prominent (gold medal). A collection of hardy plants was excellently arranged by Messrs. J. Cheal & Son, Crawley. This exhibit included Gaillardias in exceptionally good form, Violas, Perennial Phloxes, Sweet Peas, and Gladioli (silver-gilt medal). Messrs. Barr & Son staged a heautiful collection of herbaceous cut flowers. The same firm also beautiful collection of herbaceous cut flowers. The same firm also arranged a miniature rockery in a most effective manner (silver medal). Mr. H. G. Sage, gardener to the Earl of Dysart, Ham House, Richmond, staged a charming collection of herbaceous flowers (silver medal). Mr. J. Prewitt, Swiss Nursery, Hammersmith, and Mr. Wythes, gardener to the Duke of Northumberland, Syon House, Brentford, were awarded equal first prizes in the class for twelve bunches of stove and greenhouse flowers, Mr. Gibson being placed third. Mr. Chuck was awarded an extra prize for some Anthuriums. A certificate was awarded for tri-color Pelargonium Duchess of York shown by Mr. J. Prewitt.

The class for three bunches of black Grapes brought forth nine com-The class for three bunches of black Grapes brought forth nine competitors, but the leading prize was awarded to Mr. A. Maxim, gardener to Hon. Miss Shaw-Lefevre, Heckfield Place, Winchfield, who had some well coloured Black Hamburghs. Mr. T. Osman, Ottershaw Park, Chertsey, was a good second with neat bunches of the same variety. Mr. F. Jordan, gardener to Birkett Foster, Esq., The Hill, Witley, Surrey, being third. An extra prize was awarded to Mr. W. Shingler, Melton Constable East Derebam for three good bunches of Alamieles. Melton Constable, East Dereham, for three good bunches of Alnwick

Seedling. There were five competitors of white Grapes, and Mr. W. Lane, King's Ride, Ascot, was first, showing three neat bunches of Muscat of Alexandria. Mr. W. Tidy, Stanmore Hill, Great Stanmore, was second with Foster's Seedling; and Mr. T. Osman third with Mrs. Pearson.

Mr. F. Billings, gardener to R. W. Hanbury, Esq., M.P., Ilam Hall, Ashbourne. Derbyshire, was first with a single dish of Nectarines; Mr. J. Wallis, Keele Hall, Newcastle, Staffs, second; and Mr. A. Gibson, Halstead Place, Sevenoaks, third. Mr. Billings was also first for Pcaches, Mr. F. J. Debnam, Spring Grove Gardens, Isleworth, being second, and Mr. Wallis third. An extra prize went to Mr. A. H. Richwood, gardener to Dowager Lady Freake, Fulwell Park, for a dish of Peaches. Mr. W. Chuck, gardener to P. Thelhusson, Esq., Brodsworth Hall, Doncaster, was first with Strawberries. Mr. T. Elisha, Pelling Place, Old Windsor, was first with one Melon, showing a seedling, and Mr. E. Little, Milton Court, Dorking, was second, the third prize going to Mr. S. Mortimer, Rowledge, Farnham. Mr. E. Little was first for three Melons, showing Hero of Lockinge, Mr. Mortimer being second, and Mr. J. Portbury, Ripon House, Putney Heath, third. Mr. Mortimer was first for a dish of Cherries.

Heath, third. Mr. Mortimer was first for a dish of Cherries.

Mr. W. Jenks, gardener to W. M. Grant, Esq., Fairlawn, Cobham, staged a magnificent collection of Tomatoes not for competition (silver medal). Messrs. Thos. Rivers & Son, Sawbridgeworth, staged a grand collection of fruit, including Peaches, Nectarines, Cherries, and Plums (silver-gilt medal). Mr. A. Maxim, gardener to Hon. Miss Shaw Lefevre, Heckfield Place, Winchfield, showed two baskets of Black Hamburgh Grapes, packed and ready for sending to market (silver medal), as also did Mr. R. Grindrod, Whitfield Gardens, Hereford. Mr. Grindrod staged three bunches of Gros Maroc Grape in fine condition (silver medal). Mr. W. Shingler, Melton Constable, East Dereham, staged a bunch of new Grape, Lady Hastings, a Black Muscat with good berries, but a rather straggling bunch. Mr. T. Elisha sent a number of seedling Melons, dishes of Peaches, and some Peas and Cucumbers, for which a bronze medal was awarded. A first class certificate was awarded for a seedling Melon named Earl's Court, a red fleshed variety.

HARDY FRUIT GARDEN.

Peaches and Nectarines.— Treatment of Succession Shoots.— Secure loosely in the proper direction for training healthy successional shoots. Deal with the strongest first, leaving the weakest comparative latitude a little longer. As a rule it is not generally desirable to shorten these at all, especially if sufficient space is available for training; but very vigorous shoots that have attained to a length of over 15 inches may be topped to a lateral near that point if one has pushed, this forming a new leader, but weaker than the portion removed. Other laterals that may have been produced reduce to the first pair of leaves. Growths of medium strength which have originated from older wood than the fruiting shoots, and are better placed than the successionals retained, ought to be preserved, as by laying in a few of such, wherever space is or can be made available, the trees are kept more evenly furnished with fruitful wood.

Gooseberries.—Summer pruning ought to be completed without delay, pinching off the side shoots on the main stems at the fourth leaf where the spur system of pruning is adopted. After the fruit is gathered is the best time to thin out old branches for the purpose of affording more room to young growths which will eventually bear finer fruit. The young growth also must be thinned if at all thickly placed, and none of it shortened, but allowed to extend its full length under the influence of sun and air with the full exposure of every leaf. A combination of spur pruning and allowing a fair amount of young growths to remain yearly is a profitable system where young green fruit is plentifully required, as well as some needed of a larger size and fully ripened. The youngest wood will produce the former and the spurred shoots the latter. Some bushes may be treated entirely on the system of retaining young wood annually, provided the fruit-bearing shoots are cut out directly the crops are cleared, so that the growths retained may receive the benefit of sun and air in order to ripen fully to their extremities.

Red and White Currants.—The side shoots on main branches not yet summer pruned stop to five or six good leaves, in order that the lowest base buds may be properly fed and matured for furnishing the following season's crops. Full grown bushes must have the growths at the extremities of the main branches stopped the same as side shoots, but young bushes still extending their principal growths need these preserving until the winter pruning. In aged trees young strong shoots extending from the base may be encouraged for taking the place of worn-out branches or such as are producing a thicket of crowded spurs. The continued vitality and productiveness of old trees can, by gradually renewing their vigour in this manner, be maintained.

Black Currants.—No summer pruning in the sense of shortening young wood is necessary with this fruit. The encouragement of strong suckers from the base, or young vigorous wood from various parts of the

lower branches, is the best means of rendering the bushes fru ful, dispensing at the same time with worn-out branches as well as superfluous and ill-placed growths. Support crops of fruit on bushes in dry positions by watering freely and mulching, but avoid giving liquid manure where ripe fruit is hanging for late or exhibition purposes.

Raspberries. — Thin out new canes or suckers of Raspberries, allowing only four or five of the strongest to each stool. If planted in continuous rows the thinning out of the weakest canes should early be resorted to, so that when the new canes are tied in position there will be no crowding. If they extend higher than 5 feet stop them at that height. When the fruit is cleared cut the old canes down to the ground at once. Plenty of water and liquid manure with an additional mulch over the roots will benefit the plants.

Outdoor Vines.—Train the current year's wood as open as possible, exposing it and the foliage fully to sun and air, as upon this depends continued fruitfulness. The bearing shoots being stopped one or two joints beyond the bunches according as space is available, the subsequent laterals formed must be pinched to one leaf. Fruitless shoots, if any, stop to six or seven leaves. Tie in the fruiting shoots securely. Thin out the berries freely, going over the bunches a second time if necessary. Allow one bunch only to a shoot. Support the Vines well at the root during the swelling of the fruit, applying water and liquid manure.

the swelling of the fruit, applying water and liquid manure.

Outdoor Figs.—Retain no more of the current year's shoots than can be comfortably laid in without crowding, reserving each at full length. A few shoots, however, if too long to be retained entire, but for which space can be found if shortened to five or six leaves, may be stopped as indicated. Stop the extremities of shoots bearing Figs to the fourth leaf above the fruit. This serves to concentrate the vigour while still encouraging a proper circulation of the sap to feed the fruit.

Propagating Strawberries.—Rooting runners for early plants must now be attended to. The best are furnished from young fruiting plants, these, as a rule, being strong and vigorous. A few applications of water, and a mulching of manure over the roots of old plants, will assist materially in giving the runners a start, and increasing the size of the plantlets if at all backward owing to the dry season. A good method of rooting runners is securing them in small pots three parts filled with loam and manure, and upon 3 inch squares of turf previously well soaked in liquid manure. Whether pots or turves are used they should be sunk in the ground partly, if not wholly, so that they may not dry so quickly. Peg the runners in position with short wooden or iron pegs, though small stones laid on the runners nearly answer the same purpose. freely every day, and nip off the points of the runners beyond the pots or turves. Later runners may be rooted on small heaps of good, rich soil laid between the rows. Another method consists in securing a selection of the best runners on the ordinary soil between the plants, loosening it if necessary and maintaining it moist. In every case remove the weakest runners from the old plants, whereby those retained are not crowded and weakened. Beware of propagating from naturally barren plants as disappointment will follow. Such plants promptly discard before this characteristic is forgotten.

Trim away the surplus runners from all plants, and from those planted in the spring cut away the wires close to the plants as they show, propagating being seldom desirable from these. It is a better plan to induce as strong growth as possible with a view to obtaining fine crops of fruit the following year. Hoe down weeds in the driest weather. After rain strongly growing weeds may be pulled up, effecting this before the seed falls. Plan ations marked for destruction should not be allowed to be breeding beds for troublesome weeds where they remain to flower and ripen seed, which is quickly distributed unnoticed over adjoining ground. Destroy all such before they flower if the ground cannot be dug, and the weeds deeply buried at once.

Apples and Pears.—Complete the summer pruning, or the shortening of the breastwood, to from four to six good leaves. If these shoots are thickly placed, that is, several issuing close together from one spur, thin some out. The sun will reach down to the base of the shoots left better. Fruit may still be thinned with advantage to heavily cropped trees. Some of the Apples removed may be utilised for cooking.

FRUIT FORCING.

Peaches and Nectarines. - Early-forced Trees. --Trees which were started from early December to the new year will for some time have been cleared of their fruit, and having the wood on which the fruit was borne removed, if not extension, as soon as the fruit was gathered, those retained may be exposed to light and air. It is, of course, essential that the buds be properly formed and perfected, and the wood thoroughly matured, which is encouraged by clean culture and proper supplies of nourishment. The trees, therefore, must be syringed and cleansed of insects, if necessary, by the prompt application of an approved insecticide, and supplied with water, or in the case of weakly trees liquid manure at the roots. A light mulching will also tend to keep the roots at the surface, and prevent the premature ripening of the foliage. The buds in most cases will be sufficiently plumped, and the wood firm enough to allow the roof lights being removed. This should not further be delayed, unless the trees are unusually vigorous, when the lights may remain on a time longer or if lifting is to be done until that is performed. The removal of the roof lights is an old and commendable practice, ensuring complete rest for the trees, and the thorough moistening of the borders by the autumn rains.

Succession Houses.—Trees started in February have the fruit ripe, and in some cases cleared of their crops. As the fruits are removed cut out the shoots that have borne them, and thin the growths where they are so close that the foliage cannot have full exposure to light and air.

Cleanse the trees of dust by means of the syringc or engine. Red spider or other insect pests must be subdued by the prompt employment of an insecticide. Keep the borders thoroughly moist, feeding with liquid manure if the trees have carried heavy crops, are at all weakly, or do not plump the buds. Stop all laterals to one joint on vigorous trees, or allow a little lateral growth if the trees have the buds in an advanced state, this preventing premature ripening of the foliage. When the wood is matured and the buds well formed remove the roof lights. The exposure to dew and rain has an invigorating effect.

Trees Started in March.—The fruit of the second early and midseason varieties, which only are worth growing for supplies after May under forcing treatment, are taking the last swelling, and should have the leaves drawn aside and the fruit raised by means of laths across the wires of the trellis, so that the apex will be to the light. Inside and outside borders must be watered, and liquid manure supplied until the fruit commences to ripen. A light mulch of lumpy manure will lessen the need of supplies of water, but avoid heavy mulching. Ventilate early, or rather increase it, as a little air on all night is beneficial, and syringe by 7 A.M., ventilating freely through the day. When the sun loses power in the afternoon begin to reduce the air and so as to raise the temperature to 85° or 90°, with a syringing and damping of the surface. This, however, must be done with judgment, for when the sun is powerful and the house closed the water may be heated so as to scorch the leaves, which occurs in span-roofed houses running east and west. Water also hanging for any length of time on the fruit during the last swelling is liable to damage the skin, causing it to crack and imparting a musty flavour; therefore have the fruit dry before nightfall, and in dull weather syringe only in the morning or damp the floors and borders instead of wetting the trees. Cease syringing directly the fruit commences ripening, but damp surfaces, especially the borders, whenever they become dry, and ventilate rather freely.

Late Houses.—The fruit in these is quite three weeks earlier than usual and requires abundant ventilation to retard it. This necessitates frequent attention to damping and giving supplies of water at the roots. Syringe well in the morning and afternoon. Keep the shoots tied down as they advance, allowing no more than are necessary for next year's bearing, or for furnishing the trees, so that the foliage will have full exposure to light and air. Stop laterals to one leaf, retaining growth to attract the sap to the fruit. Gross shoots which push laterals from the leaf buds, cut back to where the buds remain intact, or if likely to disarrange the equalisation of the vigour of the tree, remove them altogether. Draw the leaves away from the fruit, affording as much light and sun as possible. This is important, for the higher the colour the better the flavour of the fruit.

Unheated Houses or Wall Cases.—These generally contain several varieties and have the fruit in various stages. Ours consist of the midseason and late varieties, the stoning being completed and now taking the last swelling. The trees are well supplied with liquid manure, it being run directly from the manure cart on the border by means of hose pipes. With plenty of nourishment at the roots and the foliage disposed so that it has light and air from all points, the fruit swells kindly and colours well. Keep the growths thinly disposed, every shoot given full exposure to sun and air. Syringe about 7 A.M.; admit a little air constantly, and increase the ventilation with the advancing temperature, having it full at 75°. Syringe again in the afternoon about 5 P.M. If red spider appear, subdue it by forcible syringing or the prompt application of an insecticide.

Figs.—Second Crop.—The fruit of planted-out trees started about the new year is in an advanced state, and this second crop must be thinned where too plentiful, reserving that at the base of the shoots, which swells and finishes better than at the points, where fruit must not be taken if a full first crop is desired another season. Avoid heavy second crops for a similar reason, for heavily taxed trees will not afford satisfactory early crops. Train the shoots thinly, allow plenty of space in the ties for the shoots to swell, and stop side shoots at about the fifth leaf, but only leave those for which there is room, and so as not to interfere with the extension or successional growths. Supply water copiously; if the surface is mulched with sweetened horse droppings the manuial elements will be washed into the soil each time water is applied and ammonia be given off, and the roots be attracted to and kept active at the surface. Trees in narrow borders may need water every day in hot weather, others once or twice a week according to the extent of the rooting area. Syringe twice a day forcibly to dislodge red spider. With proper feeding and attention to air moisture there will be little need for insecticides, but red spider must be kept in check, and scale removed with a brush and a soapy solution. Admit a little air constantly, increase it early, and close in good time with plenty of atmospheric moisture, then the fruit will swell to a good size, and a free circulation of rather dry air when ripening will insure Figs in perfection.

Fig Trees in Pots for Early Forcing.—It is important that the trees have plenty of light, are not crowded, and are well ventilated to solidify the growths. Syringe the trees twice a day in hot weather and occasionally only in dull, keeping the foliage perfectly free from insects. Afford liquid manure at roots, as well-fed and properly matured growths only produce really good first crops. Stopping to induce a neat habit is necessary in young plants, but it must not be practised later than this, or the young growths will not have time to mature and form embryonic Figs at the joints. Trees for early forcing must only bear light second crops, taking care to remove any fruit showing now or later, and keeping the points of the shoots well exposed to the light.

APIARIAN NOTES.

THE first week of July was the busiest of the whole season. On the 1st I took several hives and nuclei to the Heather for the purpose of getting a little Wild Thyme honey, and to secure pure fertilisation of some Punic queens, also to prepare the site for sixty hives. I have never seen Heather so early and so promising. With ten days or so fine weather during the next four weeks there will be a large yield of honey. The bees are all in the best condition for gathering.

PUNICS AND CROSSED SYRIANS.

Punics have done remarkably well in many places, and with myself. The hive referred to in the two last numbers of the Journal of Horticulture has given to its owner in a day or two more than a month after being hived 75 lbs. in supers and sections. The gross weight on the 7th, including surplus removed, was 140 lbs., tare 30 lbs., nett 110. The parent hive has yielded about 56 lbs., the nett of it being 100 lbs. The second swarm from it was lost. It would be worth the while of persons in quest of information and instructions on bees to visit Blantyre, where both Punic bees and practical bee-keepers with their weighty hives may be seen. My crossed Syrians are wonderful heavy. These and the Punics are the only unswarmed ones, but others of the same breeds have swarmed.

It is many years since I drew the attention of your readers to the fact that by caging a queen on top of a hive having a laying or virgin queen a swarm issued. I have several cases where I gave two Punic queen cells, thinking they might destroy one as they hatched out. Singular to say these queens were ripe for hatching on June 20th, and were still piping on July 7th. Three of them swarmed, but in every case went back to the parent hive. It is frequently advised to throw back an after-swarm on the parent hive after it has been off a few hours, and it will not swarm again. This, however, is erroneous advice, for so long as two queens exist in one hive they are liable to swarm at any moment, which may be prolonged for three weeks, as in the cases stated above, and that is the reason why we deposed one of the queens in the two-queens-in-one-hive system.

I have also had several cases of swarming where stray young queens entered other hives than their own. The foregoing are but a few of many similar cases which I have experienced. Some beekeepers argue that a fertilised queen sometimes takes an airing. I do not believe that, but in every case where queens were seen on the wing during any part of the year they were surplus queens from their own hive, or a neighbouring one; because queens are bred if required during every month of the year.

One important item I have omitted to mention is, that the supers and sections taken from the crossed Punic referred to were not supplied with foundation deeper than half an inch, only starters, or the yield might have been still greater.—A LANARKSHIRE BEEKEEPER.

SWARMING.

How does "A Lanarkshire Bee-keeper" account for bees swarming on a Sunday oftener than any other day in the week? I have two stock hives side by side, which sent out their first swarms on Sunday, June 18th; and as I have not had any swarms do the like before, I am at a loss to know whether I have acted rightly or not. The first swarm had just clustered on a Currant bush, when out came No. 2, and clusters with No. 1. Taking the branch and more than half of the cluster I placed them gently into a bar-frame hive, and supplied them with eight frames, two of them being filled with food and brood. The rest of the cluster was laying on the ground, which I thought, if properly hived, would possibly have a queen and settle; but it was soon to be seen the bees were not settled, as they came out and clustered under the landing board of the other newly hived swarm. There they hung for two days, and when, on the 20th, I picked up a dead queen in front of this hive they joined the other inmates, and all have worked peaceably together. I then filled up the hive—a thirteen framed one—and placed a 28 lb. section rack on the top. Is this right, or is it possible to do anything more? The stock hives are ten and eleven framed. I shall also be glad to know if any swarm will be of much use after this date. Any advice for the future working will be highly appreciated by-H. RICHARDSON, Barnsley.

[That bees swarm sometimes on a Sunday there is no doubt, but in my experience not more frequently than on any other day. Bees always make preparations from eight to ten days previous to

swarming, after which, in from six to ten days more, the afterswarms come, unless the first swarm has been delayed beyond its normal time through unfavourable weather. In such cases the after-swarm may come any time from one to eight or ten days after the prime swarm, which, under the above circumstances, may have a young queen, the old one invariably meeting an untimely end by her rival daughters or the bees themselves. One point of great moment to the bee-keeper as regards profit is to hasten the end of the plurality of queens after swarming has commenced—that is, by destroying all queen cells unless one about eight days after the first swarm. At the same time form a nucleus, or several nuclei, as surety against the loss of the queen of the old stock, and have in readiness queens to add to any swarmed hive shortly after the issue of the prime swarm. Sometimes the summer goes past while the queen remains a virgin, from the fact that somehow or other the bees permit a plurality of queens without attempting to swarm or to kill them. I have three such hives that have piped for no less than three weeks, whereas had the surplus ones been killed they might have nearly hatched by this time. The three cases mentioned had their queen cells duly excised and young Punic queens added, but second batches of these were so superior to the first that I introduced a second ripe queen cell to each, and they have piped ever since. When two or more swarms come at the same time, the bees-either through several queens or stranger bees, or both—will not settle, and it is better to allow the union, or catch both or more queens, and let them go back to their respective hives. Under the circumstances you acted wisely, and the best that could be done. The Heather and the Limes are the only two sources of honey now likely to be profitable.—A. L. B. K.]

TRADE CATALOGUES RECEIVED.

F. Cooper, Manners Street, Wellington.—Garden and Agricultural Seeds.

J. V. Van Zanten & Zonen, Hillegom, near Haarlem.—Dutch Bulbs.

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Vegetables for Exhibition (R. P.).—You should have sent the list for confirmation or suggested alterations. To publish a list that might differ more or less materially and yet not be substantially better would inevitably lead to confusion and be the reverse of helpful under the circumstances.

Tomato Fruits Diseased (H. F. Smith).—The truits are virulently attacked with Cladosporium Lycopersici, as illustrated in the Journal of Horticulture, March 19th, 1892, page 386. They are beyond remedy, and should be gathered and burned. Notes on the prevention of Tomato disease appear in the present and preceding issues.

Canker Insects (J. Hiam).—You appear to think, and indeed say, that you can find insects on cankered wood with your pocket lens that Mr. Abbey cannot find with the microscope. We have to say that if there had been insects on the specimen when he received it they would We have made close microscopic search for have been discovered. insects alleged by you to have caused canker in specimens submitted. The only insects were such as affect decayed wood, and they certainly were not the cause but the consequence of the canker. want to sec this pocket lens canker-causing insect magnified. It is like the sea serpent, a great deal talked about but not seen except by the favoured few-three individuals, we think, out of about thirty millions in the famous case. Please send a correct drawing of the creature, so that we may publish it, for convincing the other 29,999,997, or those of them who may be interested in the subject. We fear it will be useless sending more specimens unless you send the "pocket lens" with them, for they do not reveal themselves under our microscope, and it appears to be the same with Mr. Abbey's. Have a correct drawing prepared, and make yourself famous as a discoverer.

Tomato Disease (S. J. A.).—No mistake has been made as to the nature of the disease with which your Tomatoes are being overrun. The cladosporium does not affect the leaves before these are fully matured, but that does not alter the fact that "soft"—that is to say, rankly grown—stems and leaves 'are the most predisposed to attack. The disease is most virulent in a moist atmosphere, and in dull weather especially it is false economy to dispense with fire heat. One of the remedies that has been found useful is an extra strong heat, brought about principally by means of the hot-water pipes, accompanied by an atmosphere as dry as it can be kept for two or three days. "Market Grower" is fully capable of taking care of himself, and we wish you could grow Tomatoes as well as he does. You are evidently a believer in the doctrine "in a multitude of councillors is wisdom." May we add—and bewilderment?

Campanulate Foxglove (Dr. R.).—As we have before remarked, the terminal campanulate flowers in Foxgloves are abnormal and not uncommon. Abnormal floral forms also occur in other plants with

FIG. 7.—CAMPANULATE FOXGLOVE.

irregular monopetalous corollas, as in Linaria vulgaris var. Peloria, which was illustrated in the Journal of Horticulture for July 28th, 1892, page 85. In the Foxglove the corolla usually becomes enlarged and split into spreading segments, as shown in the specimen depicted in the accompanying illustration (fig. 7). We have seen many similar instances, but the precise cause of such changes has not been revealed.

Sub-Leaves from Midrib of Branching Broccoli (T. H. S.).—
The outgrowths from the midrib of the leaf are not uncommon in Brassicas, and may be due to the unusual drought, which has caused adventitious buds to form in the midrib where the veins radiate from it. One of the outgrowths is a miniature leaf, and from it proceeds a growth corresponding to the flowering branches of the head. The other has no leaf, but a distinct shoot about an inch long, with leaves from an eighth to a quarter of an inch in length, and there are buds in the centre not unlike those of flowers, into which they would probably develop if the weather continued dry. It is a great curiosity, and is no doubt due to the richness of the soil and the extraordinary weather. This has concentrated the vital forces on the midrib, forming it into a sort of stem, and buds have been formed and shoots produced therefrom as from the axils of the leaves. It generally occurs when the soil is rich and the plants vigorous.

Vines Unhealthy (B. A.).—Your letter, through not having been addressed to "The Editor," has remained unopened until there is no time left to give other than a brief reply. Lime water may be given with safety. Wireworms can be trapped with Carrots or Potatoes.

Grapes Scalded (R. A. L'E.).—We cannot name unripe Grapes. The berries sent are scalded, and the reply to "J. G." applies equally to your case. As your Grapes may be Muscats a light shade, such as a screen of herring nets or sprinkling the glass with limewash, may be advisable in extremely hot weather; and the hotter it is the greater the danger of a low night temperature, particularly if there is moisture in the house with the ventilators closed, or not opened soon enough in the

Grapes Scalded (J. G.). — The Grapes have been carefully examined. They are scalded more or less over every part, quite as much on the lower part of the bunch and under side of the berries as at the upper part of the bunch and top side of the berries. It is a bad, but not uncommon case. It shows that the night temperature has been low and the atmospheric moisture considerable, with the house closed. The sun acting upon such in the morning quickly heats and expands the moisture-laden air, and this, forced against cooler or less rapidly heated substances, as the upper surfaces of leaves, the berries of Grapes, cold walls, or water pipes, condenses, and this water being often 10° to 15°, and not infrequently 20° to 30° higher in temperature than the skin or cuticle of the berries, the parts most exposed, either to the sun or the surrounding atmosphere, have the epidermal tissues destroyed, and when evaporation takes place from such parts they shrink. If the Grapes are examined closely it will be noticed that the scalding has occurred before air has been admitted, and the discolouration and shrinking is only due to the evaporation which follows the ventilation. Had the ventilation commenced with the heating and expansion of the atmosphere by the sun, evaporation taking place from the berries instead of moisture being condensed upon them, and they had been warmed correspondingly with the surrounding air, it is certain scalding would not have occurred. is prevented by fire heat, so as to maintain a night temperature of 65° to 70°, and a little more by day artificially. This admits of air being given, and moisture does not condense on the berries. A temperature of 70° by artificial many and anough air to result. of 70° by artificial means and enough air to promote a circulation is a complete preventive of scald, but it may occur in Muscat of Alexandria on the upper part of the bunches when they are exposed to the direct rays of the sun, especially on bright weather succeeding a cold dull period, then a slight shade is necessary. As scalding is only likely to occur in Lady Downe's from a fortnight to three weeks before the colouring is well pronounced it is advisable to employ a little fire heat, so as to maintain a rather warm and somewhat dry atmosphere during that time, and until the berries are all assuming their ripening hue.

Constructing a Grape Room (H. B.).—As your wall is only 8 fect high the lean-to to allow for head room could only be narrow, but a width of 6 feet inside will allow of racks being placed against both walls. There is no objection to your using galvanised corrugated iron for the roof, with provision for ventilation, a few small openings sufficing. The straw will act as a non-conductor, and the walls should be lined with boards kept about an inch from the face. The floor may be formed of tiles or cement, the latter preferably, as it is needful to keep out rats. It will be necessary to provide pipes for heating so as to exclude frost and expel damp, fixing them as far from the racks as possible, say in the centre or path. A flow and return 2 inch pipe would be sufficient. Racks may be easily made by fixing uprights 3 inches by 2 inches against the sides at 3 feet apart, narrow surface outwards. At 18 inches from the floor line fix shelves between the uprights 3 inches by $1\frac{1}{2}$ inch, broad surface upwards, and the back edge 1 inch higher than the front, to which affix a $\frac{1}{2}$ inch square lath flush with the face on the upper surface, forming a ledge. At the same height above the first shelf fix another, and so on to within 18 inches of the top of the uprights. Proceed in a similar manner between the other uprights, forming shelves from the floor, 18 inches between, all on the same levels and heights. The shelves are for the bottles to rest on. At 9 inches above the level of each shelf fix a rail $2\frac{1}{2}$ inches by $1\frac{1}{2}$, narrow face outwards, kept 1 inch from the face of the uprights by a strip of wood corresponding with the face of the upright, and the thickness of the rail, and secure the rail to the upright with screws. The bottom side of the rail should be 9 inches above the top of the shelf. Then cut notches $1\frac{1}{2}$ inch wide and 1 inch deep on the inner edge of the rail for the neck of each bottle to rest in at 9 inches distance apart. Nothing more is required but the bottles. These are perhaps best ordinary pintand-a-half wine or spirit bottles of clear glass. Filled with water they can be stood on the shelves with the neck in the notches easily and safely.

The Caper Plant (M. D.).—Capparis spinosa, as we have before stated, from which the capers of commerce are obtained, grows abundantly in the south of Europe, along the shores and on the islands of the Mediterranean, and in Syria. It is generally found wild on walls and rocks; it is met with on the walls of Rome, Sienne, and Florence, and is extensively cultivated in the south of Europe, particularly between Marseilles and Toulon, and in many parts of Italy; but it is from Sicily that the greatest supply is brought. The flower buds form the capers so much used as a pickle and a sauce, but in some parts the fruit is also employed. In the early part of summer the plant begins fruit is also employed. In the early part of summer the plant begins to flower, and the flowers continue to appear successively till the beginning of winter. The young flower buds are picked every morning, and as they are gathered they are put into vinegar and salt; and this

operation continues for six months, as long as the plants are in a flowering state. When the season closes the buds are sorted according to their size and colour, the smallest and greenest being the best; these are again put into vinegar, and then packed up for sale and exportation. Capers are stimulant, antiscorbutic, and are much employed as a condiment, but the medicinal virtues of the plant reside in the root, which is slightly bitter, somewhat acrid and sour, and is diurctic.

Names of Fruits.—Notice.—Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing. The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. (W. S. P.).—The Apple is the Early Red Margaret or Juneating. The premature ripening and fruit-falling is probably the result of the drought.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (1. S.).—Hoya stenophylla. (A. H.).—Lilium japonicum. (F. M.).—
Monstera deliciosa. (L. M.).—1, Luculia gratissima; 2, Maranta albo-lineata. (F. Johnson).—1, Lysimachia nummularia; 3, Astrantia minor; 4, Tradescantia virginica; 5, Centaura speciosa. The others mithered (C. L. S.). withered. (C. J. S.).—1, Altremeria aurantiaca; 2, Geranium pratense flore-pleno; 3, a Ceanothus, no flowers. (G. A.).—1, Cratægus crusgalli, variety; 2, Fraxinus heterophylla; 3, Crinum capense.

VACANT FARMS.

MIXED farming generally, as was indicated last week, is without doubt advisable as a rule; the exceptions are dairy, fruit, vegetable, and corn farms. Let us glance briefly at each class of farm in view of hiring one of them—not that this is so simple a matter as it may seem to the uninitiated. The popular idea that there are plenty of vacant farms everywhere, and that every farm is re-let at a heavy reduction of rent, most certainly does not apply to really good dairy farms. Reference to the rent roll of an estate consisting entirely of grass farms shows that the rents range now at from 37s. to 60s. per acre. For a farm at the lower rent, which fell in last Lady Day, we had five applicants, and for another becoming vacant next April there are already four offers at the old rental of 40s. per acre. These farms are in the midlands, but even in Essex we have had no difficulty in obtaining a rent of 30s. per acre for fair pasture—a very different thing to much of the poor exhausted corn land of that county.

Turning to the rent roll of an East Anglian estate of corn farms we have a striking contrast to grass land rentals, those of the corn land ranging from 14s. per acre downwards to very little more than half that amount. It is only by making such ruinous reductions that tenants have been kept upon the land at all. On this particular estate there is the melancholy satisfaction that not one farm is vacant, while on neighbouring estates there are thousands of acres in hand. Nothing will induce the tenants to change or modify their practice; corn-growing or nothing appears to be a life maxim with them, and though the heavy rent reduction enables them to struggle on they have still to meet a large outlay for labour. Take for example one of the farms on this estate. Out of its total area of 850 acres there are not 30 acres in pasture, so that we may certainly estimate that there are 800 acres of it arable. Much of it is light land, but at best the outlay for tillage is a heavy matter. The staple produce is Barley and sheep, and we have no doubt the excellent flock of Suffolk sheep on this farm has stood the tenant in good stead under the depression. One point of practice worthy of all praise in East Anglian farming is the systematic sheep folding, which tends so materially to sustain soil fertility. We have striven in vain to induce our tenants in the midlands to adopt the practice on hill farms in the winter, to stimulate some of their poor pasture. But they are slaves to custom; not one of them has ever set a sheep fold, nor have they any hurdles suitable for the purpose.

Of their comparatively highly rented farms we can say that even under an easy-going system of management they answer, and there can be no doubt that dairy farms are profitable even when devoted sole'y to the production of milk for sale; they ought to be much more so under the manufacture of first-class butter and cheese. But we must not forget that at a milk farm pure and simple there is no dairy work; all the expense of a dairy plant or of butter and cheese making is avoided. Rich pasture, healthy cows, that before all things else are deep milkers, no matter what breed they may be, plenty of water and a refrigerator for cooling the milk, a sufficient stock of 17-gallon railway milk cans (which cost about £1 apiece), a station horse and cart or van, nearness to a railway station, with a milk market at not more than twenty or thirty miles' distance by rail. These are the few and simple conditions for the wou'd-be milk farmer to bear in mind. If to these he can add a few acres of arable land for roots, and such fodder crops as Vetches, Lucerne, Clover, Sainfoin, Rye Grass, mixed seeds, Green Maize, Cattle Cabbage, and Thousand-headed Kale, he will have every facility for a business which can be managed with a very moderate expenditure for labour. Outside some such radius as we have indicated it would be greatly to the advantage of the producer if milk could be diverted from the great centres of population to local butter or cheese factories, or under favourable conditions to the home productions of cheese and butter.

For cheese and butter making there must be a well ventilated, well drained dairy, so placed that no impure air comes near it from cattle yards, stables, piggeries, manure heap, or sewer, or taint will be imparted to the milk, cream, or curds, as the case may be. In it the milk is passed through the separator for butter, or is brought to a proper temperature to receive the rennet for cheese. Butter and cheese should both be made there, the cheese being taken thence to a room with shelves, ventilators, and heating apparatus; the butter to a cool store room on slates, with only wall brackets to receive them, and a central packing table or slate slab.

WORK ON THE HOME FARM.

If the annual insurance of crop and stock does not include corn or haystacks on outlying land, the prompt insurance of such stacks should always be done, as they are especially liable to accidents from the careless use of matches by vagrants. Once on fire there is little hope of saving them, as they may burn for some time before being seen, and when they are seen much time is usually lost before real efforts are made to extinguish the fire. On a property which came into our hands some time ago, the buildings of a certain homestead had been destroyed by fire and rebuilt. Among the new buildings were some neat looking stables of brickwork, but the common mistake had been made of leaving the inner walls exposed, with the equally common result of bricks and mortar being kicked to pieces by the horses. All brickwork in stables must be covered to a height of 5 feet with stout match board. ing, to prevent this vexatious destruction of property. This is entirely a matter for the owner or agent of the property to see to. In our experience we have not found tenants to trouble themselves about it.

Milch cows should be kept in by day during this sultry weather or they will be so worried by flies as to be constantly rushing about the pasture to their detriment and a serious falling off in the milk yield. Not only is it a humane thing to have commodious well ventilated hovels which can be closed for this purpose, but it is decidedly profit-With a good cut of Clover, Lucerne, or other green fodder going, the hovel or cowhouse racks are filled regularly twice during the day, so that the cows can quietly feed in comfort and then be turned out after the evening milking. Here, again, the few acres of arable land on a dairy farm tell in an acceptable supply of green fodder as an invaluable auxiliary to the permanent pasture, enabling the grazier to do the best thing for his own advantage in the better management of his stock.

Especial attention has been given to pig breeding so as to have a large number ready for the corn stubbles. This is an easy matter as young sows come into breeding so early, and it is certainly desirable to breed sows as well as store pigs while they are so dear. We have recently seen some enormous sows in the Midlands, and must needs repeat our warning against keeping such unwieldly animals.

REMARKS.

2nd.—Hot, hazy, and oppressive; clouds at times in evening.
3rd.—Generally sunny, but a good deal of cirro-cumulus cloud.
4th.—Bright breezy day, cloudy at times in afternoon, overcast evening, and rain from 10 P.M.
5th.—Rain till ? A.M., overcast morning, spots of rain at noon, occasional gleams of

sun in afternoon, cloudless evening.

6th.—Hot, clear, and almost cloudless,

7th.—Sunny and hot, but calm and a little hazy.

8th.—Sunny and hot, but some breeze; heavy rain with lightning and thunder from

4.30 P.M. to 5.30 P.M., showers again at night.

A very hot week, hotter than any week in Jubilee year (1887), or than in any year back to 1882 at least.—G. J. SYMONS.

NOW that the rain has come and moistened the parched earth gardeners, farmers, and amateurs—indeed all who engage in the cultivation of the soil, will to a more or less considerable extent be relieved from the anxiety that in some cases was almost too heavy to be borne. Artificial watering has been indispensable in gardens over a long period in order to prevent the collapse of plants and crops; but notwithstanding all the labour devoted to it, and it has absorbed most of the time of many workers, anything like satisfactory growth and a full supply of seasonable produce could not be produced. The earth might be moistened for short periods, but the parchingly dry atmosphere was a great counteracting force and uncontrollable obstacle to the progress of vegetation.

Trying indeed the season has been even to persons engaged in gardens who have had a good water supply at hand; but to obtain and distribute it has been almost heart-breaking work to many an earnest man, and such men envied those with water "laid on" and hose to conduct it where required. With the home water supply practically exhausted and only limited quantities obtainable from a distance, then did the position become almost unendurable, and it has been a case of "all hands to the pumps" except those engaged in carting or carrying the precious fluid nearly all the hours of daylight, with, unfortunately, very little to cheer them for their labour. We may use water as we may, by hand distribution, the return is disappointingly small during a season of protracted drought; and only when the supply was full, and of the best character, with adequate mechanical means provided, could lawns be kept green and plants and crops in a flourishing state in the open air, during the exhausting period through which we have passed. Even when all that can be done is done—and we wish more could be accomplished in water storage—there is nothing like a supply direct from the clouds—the great restorer of languishing vegetation -"sweet refreshing rain."

This has come at last, and brought relief to thousands of workers on the land, also in time to be of incalculable benefit, but too late to save valuable crops that have been lost to the husbandman. The most energetic and best cultivators will make prompt efforts to obtain such compensation as they can in the form of subsidiary crops, and it is wonderful with what rapidity those sown or planted late, as referred to in another article, grow through the autumn months under the earth warmth, now so great, in combination with the moisture also, we hope, in most districts prevailing. But the rain, though it opens the land for working, and stimulates cultivators to make the best of it, may, if prolonged, summon into activity at least one enemy, the Potato disease; and all who wish to avert it by the dressings that have in many cases proved effectual will do well to act in time.

In the case of this and indeed all fungoid and insect enemies, nothing is so fatal as procrastination. Prompt action on the first and faintest symptoms of attack is potent in its influences. A waiting policy is always dangerous. Two insects are more easily destroyed than two thousand, and in the former case injury is averted, while in the latter it has been more or less disastrous. In dealing with fungoid attacks similar remarks apply, but with even greater force. Parasitic visitations can be checked and even destroyed in their infancy, but when deeply established in the

tissues of the host plants, no matter whether these are Potatoes, Tomatoes, Vines, or any others, they are practically ineradicable. In nine cases out of ten when well proved antidotes fail in accomplishing the desired purpose, it is not the fault of the articles, but of those who apply them, or who rather fail to do so until the time has passed for them to act with effect. Yet so much of perversity do we find in frail humanity that some persons who fail through their own inactivity are the first to decry the means as useless, and the most ready to accuse of incapacity those who have endeavoured to help them. This has always been so, as all men of long experience know, and so it is likely to be to the end, for each generation appears to bring in turn men of similar idiosyncracies to those who have gone before, but we would fain hope the peculiars will be fewer year by year.

After the rain, too, we may hope to hear less of under-glass difficulties—the scorching and scalding of Grapes, and the drying-up of Cucumbers and Melons, leaving the former bitter and the latter flavourless. Where the water supply is adequate, and not chilling in its coldness, such evils, with otherwise good management, are avertable. This statement, though hard to believe by the victims of such mishaps, is proved to demonstration by hundreds of cultivators who, by their skill, foresight, quick perception, and close attention fortify themselves against the contingencies, and have none of the troubles to deplore. Insufficiency of moisture, both in the atmosphere of plant and fruit houses, as well as in the soil in which Vines, Cucumbers, Melons, and various other plants, crops, and trees are grown, is one of the main causes of most of such evils as those indicated, and with which too many persons have to contend.

We have lived long enough to note that the greater the heat and more protracted the drought the greater the number of complaints we hear of Cucumbers and Melons failing to give satisfaction, and of Grapes shrinking instead of swelling to maturity. This ought not to be so. All those crops should be better in bright and hot than in dull and cold seasons, and they would be with full support and a well-managed system of ventilation and other cultural aids appropriate to the circumstances. The brighter and more continuous the sun the greater the quantity of water passes as vapour from the leaves of plants, and therefore the greater must be the supply for the roots to imbibe, with proportionate moisture in the atmosphere to counteract extreme transpiration. When the escape of moisture from the leaves of whatever may be grown is in excess of that supplied by the roots, collapse both of foliage and fruit must occur sooner or later. And with the weakening of the foliage in a too dry atmosphere come insects, for the conditions that are unfavourable to healthy growth are in almost the same proportion favourable to the increase of the foes of the gardener. With thorough health in plants, trees, and crops, the result of sound culture, and the prevention of checks and chills, there would be fewer difficulties to encounter, and less complaints to meet and explanations to make relative to the quality of the produce supplied.

Why are there so many inferior Cucumbers this year and ill-flavoured Melons staged at exhibitions? We have seen hundreds of both, and not one pair in ten of the former were anything like so fresh and tempting in appearance as are those grown by specialists in bulk for the market. In one case the plants have been comparatively starved and probably insect-infested, and in the other they have been well fed and kept clean. The half-exhausted plants may be expected to improve under moister surroundings, and it is hoped they will do so.

In respect of Melons we are well within the bounds of strict accuracy in saying that at some, if not most, exhibitions it has been difficult to find three fruits worthy of the prizes provided for them. The majority have been distinctly inferior and not a fcw positively "nasty," as many a judge knows too well. In some instances the result is, perhaps, attributable to the search for

No. 2338.—Vol. LXXXIX., OLD SERIES.

improvement by crossing, this ending in spoiling many fruits through inferiority of variety; but in most instances the shortcomings are due to the late exhausting weather and exhausted plants. The roots have failed to supply adequate nutriment, and the leaves failed to manufacture and secrete the requisite juices for the development of high-class fruit. Insects have, in too many cases, enjoyed what the plants needed, and when these abound well fed highly flavoured Melons or any other fruits are out of the question. Now that rain has come it is hoped that many insects will go. This will certainly be the case outside, and therefore suggests the way they may be banished from under glass, as they should be and must be if cultural success is to be attained.

The hot season has proclaimed with trumpet tongue the value of high culture—deep rich soil and cleanliness. From Land's End to John o' Groat's the crops tell the same significant story—land starvation and neglect leading to ruin; land enrichment and high management tending directly in the other direction, the crops holding out the longest and yielding the best. There is no exception to the advantages of sound culture, and as in the open air so under glass, the best work tells and the best men win, not at shows alone, for that is a comparatively small matter, but reputations at home by their industry and skill. We want more of such winners, in many fields especially, as well as in some gardens, alike in the interests of the producers and the increased prosperity of the country.

PREPARING FOR THE WINTER.

Owing to the abnormally dry weather experienced during the present season the work of planting vegetables in their winter quarters has been, in many instances, greatly delayed. Now, however, showers have become general all over the country the work should be completed as quickly as possible, otherwise the plants will have but a short season of growth. Those that were early planted have not made much progress this season, except in the very few instances in which they have been copiously supplied with water, or when a mulching of short manure or leaf soil has been given. The advantages to be derived by carrying out the latter practice with garden crops generally, has, this season, been strikingly demonstrated, and in all instances where the soil is light or shallow I strongly advised a mulching to be given now if possible, because the rapid and long continued evaporation has extracted a vast amount of fertility from the soil.

To make up for this deficiency a thorough soaking with liquid manure given to all established plants before the mulching is put on will be found extremely beneficial, but there should be no mistake as to what is meant by a "thorough soaking." Three gallons to a square yard may be considered as such, and be depended upon to moisten the soil down to the roots of the plants. The drainings from stables, piggeries, or the contents of other cesspools, will answer the purpose splendidly. Failing these natural fertilisers, a pound of superphosphate of lime with half a pound of nitrate of soda, mixed in twenty gallons of water, makes a good liquid manure, so does 2 lbs. of guano dissolved in thirty gallons of water, or a peck of soot placed in a muslin bag and steeped in the same quantity of water. A little timely attention given to these matters will speedily have a marked effect upon all crops, and by encouraging early growth the chances of suffering loss during severe winters is greatly lessened.

Turning to those crops which have yet to be planted, it is well to set out good breadths of the various kinds of Kales and Coleworts which have proved hardy during recent winters. Foremost among these may be mentioned Asparagus Kale, which has been quite a "sheet anchor" in numerous gardens during the spring months, at a time when the loss of Broccoli have been much felt. This fine Kale also possesses the rare quality of having a delicious flavour when cooked. At this late season, if the rows are 2 feet apart, the plants will not require to be more than 15 inches asunder in the rows, or if set between the early Potatoes now being taken up, the distance between the lines may be a trifle less to correspond with spaces between the Potatoes. When planted between late Potatoes I prefer to lay the haulms in the centre of alternate alleys, set the Kales (in those thus cleared) a foot apart, and as soon as the tubers have been lifted take up with a spade every other plant, and replant in the centre of the intermediate spaces. Late Dwarf Green Curled is another invaluable Kale suitable for planting largely at the present time; with us during

the last two seasons it has supplied tender greens up to the time that Cabbage could be cut in quantity. It requires about the same space as Asparagus Kale. Late Queen Broccoli ought now to be of the right size for planting. Taking a lesson from the experience of last season we are this year depending largely upon this variety and Leamington, though of course plants of the latter have already been planted. If the former are set out in rows 2 feet apart, a distance of 6 inches less between the plants will be found sufficient. Rosette Colewort and Little Pixie always prove exceedingly useful during the autumn months. We have now a good bed of these from sowings made early in June, and the plants will be set out shortly a foot apart in good rich soil. Plants resulting from sowings made late in June will also prove useful, but it will be a great advantage in their case to plant on a warm border.

Thus far I have dealt especially with those crops which are particularly adapted for late planting. Where, however, other varieties of Borecoles and Coleworts, which, during ordinary seasons are put out at a much earlier date, are not yet planted into their permanent position, the work may still be done with the prospect of securing a fair amount of success, though, as a matter of course, they will not make such strong growth unless we are favoured with an exceptionally warm autumn. Cottagers' Kale, Sprouting Broccoli, Chou de Burghley, Brussels Sprouts, and Couve Tronchuda are all good varieties to which the foregoing remarks apply.

Before lifting the plants the soil about the roots should be thoroughly moistened. If they have been previously pricked out they may then be lifted with good balls of earth, and will under such favourable circumstances experience but little check. When they have to be planted direct from the seed bed it is a good plan to dip the roots in a puddle made of clay sufficiently thick to adhere to them; this frequently wards off the attacks of grubs, which often make sad havoc with plants destitute of small fibrous roots. For the convenience of watering the plants should be set in drills, and a slight hollow left around the stem of each plant.—H. D.

STRAWBERRY FARMING.

To market gardeners and allotment holders who contemplate starting a Strawberry patch due consideration and care at the outset go far towards future success. Assuming that the land is suitable in aspect and in accordance with the remarks in my last contribution (page 5) we can pass on to the preparation of the bed for the plants. Now is a splendid time for beginning operations. The early Potatoes are coming off, and the land can be easily and effectually cleaned. This is of paramount importance when we remember that the plants are to stand for four or five years. The man who ensures a perfectly clean, deeply cultivated plot, with rich supplies of good farmyard manure well dug in, need have little fear.

The plants for the production of marketable fruit must be hardy, good croppers, producing berries of good size, shape, and flavour. There are at least three capital varieties, which answer in almost every particular to this description—viz., Sir Joseph Paxton, Laxton's Noble, and Dr. Hogg; and any grower could not go far wrong in selecting all or any of these. The two former are at present mostly grown in the Hampshire and Surrey fields, but I believe there is a grand future for the latter, for I saw a fortnight ago at a local show two dozen berries of the Dr. Hogg variety which weighed 1 lb. $10\frac{1}{4}$ ozs., and were of exquisite colour, shape, and flavour. If either of these varieties is chosen, plenty of space must be given for development, as all are very gross, and should not be closer than about 30 inches in the rank and 18-22 inches (I prefer 22) between the plants. After planting, little more than keeping down weeds and pinching off runners need be done; the latter is essential, in order to enable the young plants to get strong before the frosts set in.

The hoe must be kept at work throughout the spring. Many people pluck the first blooms so that the plants shall not fruit the first season, but this mode of procedure is not advisable. There may be a gain in constitutional strength, but under any conditions the plant will throw two or three new crowns in one season, and it is from these new crowns that we expect our fruit. In fact, the largest and best trusses of fruit always grow centrifugal. Besides, "a bird in the hand" is applicable here, and two medium crops with some immediate returns are preferable. As the young plants often give the earliest and finest fruit they therefore pay for a little bedding. Light straw, short rushes, coarse grass, in short anything which does not contain seeds, is suitable for the purpose, and should be well laid as soon as the Strawberries reach the size of marbles. If it can be spread soon after a good rain

so much the better. Growers usually run over their plots before bedding and cut off the remaining runners to throw strength into

Early fruit is gathered in punnets, and sells readily; but as soon as the glut comes it is picked into gallon baskets ($6\frac{1}{2}$ lbs.) and sent up to market without further disturbance. Punnets can be cheaply bought in the winter by the gross, and the gallon baskets are not expensive, 2s. 6d. or 3s. per dozen. The fruit will sell readily at the nearest town, but where the fields are of large size the produce is put on the rail to London, Glasgow, Edinburgh; in fact, some of the best prices have this year been obtained in the two latter towns. The sale is practically certain, but great judgment is required in placing the fruit. The grower must know his man.

Strawberry plants bear their maximum crop when three and four years old. After the fifth year they require lifting, as the fruit begins to get small. In setting out a piece of land it is therefore necessary to arrange the beds in stages, so that they come in and go out of cultivation one after the other. When the crop is off rake up the bedding, and if only a few runners are required trim the plants with a hook, clear out the rubbish, and set the hoe to work. Old worn-out plants should be grubbed up and burnt and the ground dug for Potatoes, thus affording an opportunity of again getting the land into condition by liberal cultivation and plentiful supplies of rich manure. — EDWARD H. SMITH, Warminster.

BACTERIAL DISEASE IN TOMATOES.

EACH week since the appearance in the Journal of Horticulture of my first note respecting the above I have looked eagerly for some further communications throwing more light upon the subject. appears, however, that none is forthcoming, and we must, for the present at least, be content with Mr. Abbey's far-from-consoling assurance that there is no known remedy for the disease.

A few days subsequently to the writing of my former note I paid a visit to a friend, who showed me several hundreds of Tomato plants that had succumbed to an attack of this disease, and although my losses have been trivial, I consider the matter of sufficient importance to warrant its being thoroughly investigated in hopes of eventually finding a cure, or better still, a preventive. That seems impossible without first discovering in what way the bacterial germs or spores are introduced. Mr. Abbey, in his exceedingly interesting communication, page 472, advises the avoidance of animal manures, with which advice I entirely concur. At the same time I wish to mention that in the house where the most stable manure was used this year I have not lost a plant, whilst last year, in the same house, when Thomson's and silicate manures were used and no animal manure, I lost, as nearly as I recollect, seven or eight plants.

Before reading Mr. Abbey's report I felt fully convinced that the disease was not infectious, for on only one occasion have I had two plants in close proximity to each other die, although I have occasionally left an infested plant until it was quite withered. Allow me to add, this is simply my experience, and not intended to reflect suspicion of a

doubt on Mr. Abbey's statement.

Turning to "J. F. D.'s" remarks on page 505, I wish to inform him that for eight years before coming to this place I had grown Tomatoes without being troubled with diseased plants or fruits, and probably felt quite as sceptical respecting their injurious effects as your correspondent appears to do. Subsequent experience has taught me to believe in and also to respect Tomato diseases, although of all they are subject to, I consider the one now under consideration the most to be dreaded.

As to procuring seed from one of the best houses in the trade, I agree with Mr. M'Dougall that the best results do not always follow even then. In my case the seeds, as before stated, were procured from a friend whose plants have never been troubled with bacterial disease, and only to a limited extent with any other. In conclusion I would like to ask Mr. Iggulden to give us his opinion on this subject, as I was informed a few days since that he is by no means a stranger to its effects, both on Tomatoes and Cucumbers.—C. LOCK, Bristol.

DENDROBIUM HOOKERIANUM.

WHEN well grown this is a beautiful Orchid, and it is surprising that one does not se; it more frequently in small as well as large collections. Some time since I saw several fine plants with growths quite 3 feet in length, and these bore many flowers. The latter, as a rule, measure from 3 to 4 inches in diameter, and

are of a deep rich yellow colour. The lip is velvety yellow, and there are two blotches of deep yellow in the throat. This noble Dendrobium is also, I believe, known as D. chrysotis, under which name it is sometimes figured. Perhaps an illustration of it would convey to your readers a better idea of this grand Orchid than will any description of mine.—ORCHIDIST.

[The accompanying engraving (fig. 8) depicts a bloom of Dendrobium Hookerianum.]

CIRRHOPETALUM BRIENIANUM.

This species was introduced from Borneo by Messrs. Linden, of L'Horticulture Internationale, Brussels, with whom it flowered in March, 1891, when it was sent to Kew for determination. A plant from the same source flowered with Mr. James O'Brien, of Harrowon-the-Hill, in the following October. It belongs, says the "Kew Bulletin," to the group having the dorsal sepal and petals ciliate or

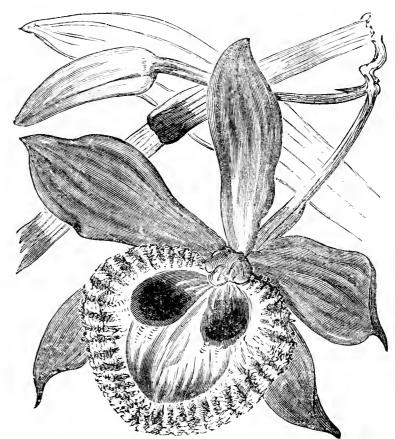

FIG. 8.—DENDROBIUM HOOKERIANUM.

appendaged, and is allied to C. Makoyanum. The lateral sepals are light straw-colour, except a small portion near the base, which, as well as the greater part of the dorsal sepal, petals and lip, is very dark dull maroon.

CŒLOGYNE BORNEENSIS.

According to the "Kew Bulletin" this species belongs to Lindley's small section Flexuose, and may be placed next to the Javan C. longifolia, Lindl., which has longer and narrower leaves, and the pseudo-bulb without a slender attenuated neck. It is a native of Borneo, whence it was introduced by Messrs. Linden, of L'Horticulture Internationale, Brussels, in whose collection it flowered last August. The flowers are whitish or light buff (this point remains doubtful owing to the flowers being somewhat withered), with red-brown reticulations on the side lobes of the lip, and some markings of similar colour on the front lobe.

STANHOPEA LOWI.

This handsome Stanhopea is allied to S. eburnea, Lindl., and S. Reichenbachiana, Roezl., differing from the former in its globose hypochil and differently coloured flowers, and from the latter (known only from description) in having the mesochil solid, not deeply channelled, as Reichenbach twice distinctly states in his description. The character is an essential one in the genus, other-

wise the distinctness of the present one might be doubted.

S. Lowi was introduced from New Granada by Messrs. Hugh Low & Co., of Clapton, and flowered in their collection last December. The sepals and petals are of a creamy buff shade, the latter with numerous minute brown spots on the disc. The lip is ivory white, the upper half of the hypochil with bands of dull marcon, formed of numerous suffused spots with some scattered dots between them. The column is pale green, with ivory-white wings. The flowers exhale a powerful, almost Narcissus-like fragrance.—("Kew Bulletin.")

CANKER IN FRUIT TREES.

BEFORE replying to the articles on this subject by Mr. Kruse, "A. D.," and Mr. Pendered in the issue of the Journal of Horticulture of June 22nd (pages 497 and 498), I desire to correct an error in my paper on "American Orcharding"—viz., the "36 bushels" in the first sentence of the seventh paragraph on page 437 should have been 24 bushels.

Mr. Kruse's able description of the soils of the ragstone range of hills in Kent is interesting and valuable. A brief digest of the conditions of soil and environment disfavouring or countenancing canker in Apple and Pear trees on the Kentish rag formation will be instructive

and useful.

1, On the lower slopes of the ragstone range of hills the rock (calcareous sandstone) is nearest the surface, therefore well drained; the ground is the richest from the rainwash or debris brought down from the higher parts of the range, and it is the lightest in colour, because it is nearest the rock, consequently contains more lime, and from the water percolating through it freely the iron has been eliminated or assimilated and taken up by the crops during an untold period of cultivation or carried off by the water passing through the soil. Under these conditions the Apple and Pear trees canker the least. This being 30, and if parasites are not the cause of the cankerous affections, why

do the trees canker at all?

2, At the top of the ragstone range of hills the subsoil is a red clay, water must pass through it slowly, or not at all, and this will, in a greater or lesser degree, irrigate the ground lower down, and enrich it with assimilible iron and other tree food; the soil is also redder and less rich than on the lower slopes—this through air and rain not entering it freely so as to liberate and render its stores of nutrition so quickly available as where the soil is more open. Thus the trees are placed at a disadvantage, not only in respect of soil, but of climate, for it must be colder at the top than at the bottom of the range. On this part of the hills the Apple trees canker the most, and "hardly any Pears will do well, the fruit of most varieties cracking so much as to be worthless, and the trees are unhealthy." Mr. Kruse, it will be observed, makes a distinction between the canker of the Apple trees and the cracking of the fruit and ill-health of the Pear trees, and this shows conclusively that the diseases are different. That of the Apple trees may or may not be due to fungi. I have never stated, as "A. D." alleges, that the cankerfungus (Nectria ditissima) was the sole cause of cankerous affections on Apple or Pear trees. The evil may and does result from several causes Apple or Pear trees. The evil may, and does result from several causes, and I have said and shown that trees may have many wounds without the fungus growing in them. But there is no question about the Pear trees; they or their fruit are troubled with scab-fungus (Cladosporium or Fusicladium dendriticum var. pyrinum), which attacks the young wood and produces the cankerous, scaly condition of the bark, so well seen in Louise Bonne of Jersey Pear in far too many cases, especially on the Quince stock, in cold localities and heavy or wet soils. Is not the canker in the Apple trees and the cracking of the fruit and ill health in the Pear trees as much, if not more, due to the unfavourableness of the environment than to the soil? The latter may be improved by drainage and cultivation, but who can alter the climate? Nevertheless, the climate may be much improved for tree growth by attending to the sanitation of the soil, or, in other words, the trees so benefited by drainage and soil improvement as to resist the parasites which await a

favourable opportunity to fasten and prey upon them.

3, Midway between the top and the bottom of the slope of the ragstone range of hills, "the soil is a rich brown loam in a very good condition, owing to the abundance of ragstone débris, is neither too heavy nor too light, and is well supplied with the principal elements of plant food. Experience shows that these are in a sufficiently available form. form, for all kinds of vegetables can be grown of splendid condition, and fruits of high quality are cultivated." Such is Mr. Kruse's description of the soil of the slope on which he operates. In this "rich brown loam in a very good condition," and in a favoured situation of a county that produces the best using Apples in the world, "some trees of almost every variety canker. With some varieties there is only a tree here and there, and other sorts canker so much that it is impossible to grow them except for a few years." Mr. Kruse's evidence is conclusive. It is not a question of soil so much as of environment and of the "survival of the fittest," for "the higher the ground the more the Apple trees canker."

But Mr. Kruse still adheres to the soil theory, and thinks he would be benefited in his culture by an "analysis of a good Apple soil in the Weald of Kent." I cannot help him in this matter, and think it would not benefit him much if I could. After a careful study of the soils of these islands, and guided by nearly half a century's experience, I am convinced that cultivators who pay the most attention to the natural adaptability of crops to the soil and position obtain the best results with the least expenditure of labour and manures. So with fruit trees. To secure healthy trees and profitable crops of fruit they must be suited alike to the soil and the location; and to avoid disease—canker or any other—we must select those varieties best able to resist and throw off the parasite producing it. This means finding out by experience or observation the varieties that succeed, and plant those only. This applies to all parts of the British islands, for there is not a spot in them applies to an parts of the British Islands, for there is not a spot in them up to 500 feet and more above the sea level that is not fitted for the production of some varieties of hardy fruits. With all duc deference to soil theorists and the ransacking of all parts of the world for manures, I am satisfied that cultivation and selection of kinds and varieties are far more important.

"A. D.," page 498, commences by sheltering under Mr. Tonks' mantle. I was under the impression that my views and those of Mr. Tonks and other earnest inquirers were identical—namely, that sound cultivation is the prime agent in securing healthy trees and profitable crops of fruit. It is as well to be disillusioned in this case. "A.D." says, "Canker is a product of starvation in respect of the particular variety affected, or in other words, it is a disease caused by the absence in the soil of the elements which are essential to the healthy maturation of the wood." This is a remarkable statement, and shows that he has nothing in common with Mr. Tonks, who did not advise different kinds of foods for various varieties of Apples, but a complete food for all the Apple family wherever situated, subject to variation according to the requirements of different soils as ascertained by analysis. "A. D." does not see this, but asks, "How is it that of two varieties of Apples or of Pears growing close together, . . . under absolutely the same conditions, yet one is healthy beyond all question, the other cankers badly, and hardly ever ripens annual growths?" He then answers, "The reason is obvious. One sort finds all that it needs in the soil, the other does not." How does "A. D." prove this? Where is the "obvious reason?" I see no description of the soil or an analysis, no specifying of the varieties, and "A. D." sees nothing but soil starvation to account for the difference. What about constitutional hardiness in different parieties? Here is a What about constitutional hardiness in different varieties? Here is a chance for "A. D." to tell us why the Calville Blanche Apple requires to be grown under glass in this country, and the Hunthouse thrives at elevations in North Yorkshire over 500 feet above the sea level. Will "A. D." oblige by naming the "predisposing cause," the reason for the difference in hardiness between two varieties of Apples, perhaps raised from two pips taken from the same core of the parent Apple, and why one has a better constitution than the other. Until an answer is given to this I must decline to accept "A. D.'s" preconceptions of predisposing causes; but at the same time he adduces evidence in support of my contention that the reason why all Apples and Pears do not suffer equally from earlier is more a question of constitutional hardiness and equally from canker is more a question of constitutional hardiness and adaptability to position than of soil. This is shown in the second para-

graph of his critique as follows:—

"Trees growing together side by side for forty years, Ribston, Alfriston, Wellington [Dumelow's Seedling], cankering badly; Waltham Abbey Seedling, Cockle's Pippin, and Beauty of Hants doing splendidly. All on Crab stocks, soil a deep and not very sweet clay. Again, of Pears, Alexandré Lambré, Thompson's, Nouveau Poiteau, and Williams' Bon Chrêtien do wonderfully well, planted twenty-two years on the Pear stock. Beurré Diel and Beurré d'Amanlis canker very badly, fruit split and spotted, comparatively worthless; others [what varieties?] fruit perfect, clean, and delicious." Then follows the question, "Why is the canker?" and "A. D.'s" answer is, "Because of predisposing causes." These "are deficiency of tree food, the lack of essentials to health; in other words, of the formation of perfectly sound ripened

Now let us recognise established facts. Ribston Pippin has its home in the rich, deep, porous soil of the great Vale of York, where it has a different climate to that over a "deep, and not very sweet clay." It cankers to death on hot sands. Alfriston deserves a better fate than a lingering death on a sour bottom; so also does Dumelow's Seedling, which, however, will not thrive in the warm soil of Sandy in Bedford-Waltham Abbey Seedling, Cockle's Pippin, and Beauty of Hants do well in all fairly good Apple soils, even as far north as the North Riding of Yorkshire in lightish soils. The soil theory, therefore, breaks down along the line, and the selection of varieties suited to different soils and localities marches on as it has done in all time to victory. As for the Pears, it is certain that they are similarly influenced by location, and the hardiness or otherwise of their inherent constitutions. Beurré Diel and Beurré d'Amanlis Pears had not the fruit cracked by soil influence, but by scab-fungus, and the susceptibility or otherwise thereto is more due to climate than to soil. In the north the trees are healthy and the fruit without speck or blemish, fruits of Beurré Diel often weighing 1 lb., and sometimes over 2 lbs. in weight.

Among other things "A. D." says, we get rid of the canker by taking the head of the tree clean off and replacing it by grafting with scions from a variety that thrives well on the soil. The head is not "replaced" but a new one provided of a variety suited to the climate, for the roots are in the same soil as before. Sir Walter Raleigh said "bcheading is a cure for all discases," and it is often the best for Apple trees afflicted with canker. But it is not Mr. Tonks' plan, for he cured his cankered trees, not one variety in particular, but all, with the same generous regimen. I have not the least doubt that Mr. Tonks cured his trees of what he considered to be canker, and I am equally certain that those trees had not canker-fungus (Nectria ditissima) growing in them, for the parasite, once seated in a shoot, sooner or later if not destroyed, compasses its destruction. Lift fruit trees and improve the soil by all means, apply manures and attend to all the cultural requirements, but rest assured that none of these will avail against canker or gum caused by fungi, for the diseased limbs will remain so unless the parasite is destroyed or removed by incision or amputation.

Trees injured by frost, as described by "A. D.," clenches my argument. They did "splendidly for many years" before the frost played havoc with them. Yes, the spores of the canker-fungus took possession of the wounds. He will not allege, I hope, that the frost would permanently affect the constituent elements of the soil. What then becomes of his soil theory? The soil had clearly nothing to do with the consequences in that case

quences in that case.

I could say much more in reply to "A. D.," but I am encroaching,

and must refer briefly to Mr. Pendered's communication, on page 498. He says, "I first thought the canker was caused by an insect" (so does Mr. Hiam and Mr. Harrison Weir), "and then by a fungus, but I came to the conclusion the insects and fungus were due to the disease, and not the disease to them." No reasons are given for this conclusion. This does not alter the facts. "Canker may differ on various soils and in different localities." Just so, it is a question of varieties suited to different soils and localities—a mere matter of selection. Then follows a very accurate description of canker in the second paragraph as caused by fungus, beating my best endeavours, and he goes on to say, "As a remedy I cut off all the worst cankered branches, and cleaned the remainder." "The result was a success." Just so, the fungus was got rid of to a certain extent, but not entirely, for "it comes again after a time." Had Mr. Pendered cut away all the cankered parts in the first instance, it is perfectly clear he would not have been troubled with canker afterwards, unless the fungus had appeared again in fresh wounds.

Mr. Pendered cures canker in Gooseberry and Currant bushes by letting it have its run upon them, and when they are no longer profitable roots them out and plants young trees. There is no canker in Gooseberry or Currant bushes caused by fungus. It mainly arises from larval attacks and damage in other ways, the Nectria found on these bushes being always on the dead wood or bark, and not in the living tissues. The canker, so-called, in the Laurel is really gum, due to a fungus (Coryneum Beijerincki), and is the same as that causing gumming in Cherry trees. There is no cure but incision or amputation. Old Laurel bushes cut off to the ground or near, no matter how large and badly smitten they may be, will push strong healthy shoots from the base and form fine bushes in less time than the best rooted and most carefully planted and tended young shrubs. It does not matter what the soil may be, provided it is such as Laurels will grow in, nor whether the locality be high or low, if it is not unfitted for their growth.—G. Abbey.

WASPS AND THEIR DESTRUCTION.

A CORRESPONDENT, "J. R. G." (page 28), writing on the destruction of wasps, pronounces gas tar the "most efficacious remedy his gardener has tried." It is the cheapest and most complete destroyer of wasps' nests that I have found, after experience with every method recommended in the Journal of Horticulture last week. Hundreds of nests have been "settled" by pouring a quantity into the entrances through the spout of an old watering can. It is the work of half a minute, and not in a solitary instance has the plan failed, whether a sod was pressed over the nest entrances or not. It is easy to cover them, and this is generally done, though scores have been left open for purposes of experiment, and always with the same result—nest destroyed. A neighbouring gardener, who has used gas tar for more than twenty years, never thinks of covering the nest entrance after the doctoring. In both these cases gas tar is made on the premises, and therefore costs nothing.—NORTH LINCOLN.

THERE are more wasps' nests this season than I ever remember seeing or hearing of before. To make matters worse, all are unusually strong at this early date, and the fruit is being attacked even before it is ripe. Taking or destroying a few score nests does not seem of much avail; at any rate, I see no great falling off in their numbers. Grapes, ripe and ripening, were soon found out, and before we were able to apply the right remedy it was scarcely safe to go near some of the bunches; and what is the remedy, will be the question to which many readers will be glad to have a reply. For several seasons past I have tried Davis' wasp killer, as a destroyer of wasps and a preventive of their attacks, with never-failing success, and once more it has done good service. A few drops of this poisonous syrup applied, with the aid of a pointed stick, to berries or other fruit that has been started on by wasps soon attracts the latter, with the result that those eating it are killed, and the rest are apparently frightened away. I would not be without so effective a remedy on any account. Gas tar for nests to which it can be applied, and Davis' wasp killer for the rest, are my remedies, and they never fail.—W. IGGULDEN.

MR. E. BROADY on page 14 asks for information from others respecting the effects of cyanide of potassium on wasps and the larvæ in the nests. I have used it with deadly effect in some cases, and have known it comparatively harmless in others. There are many things to take into consideration—weather, state of the ground when used, cracks, position of nests, and species of wasps. We have three species of ground wasps—Vespa vulgaris, V. germanica, and V. rufa, and three building above ground, all having their peculiarities. I have known the three species of ground wasps' nests within a yard of each other on a favourite bank.

Vespa rufa, which never grows into a large colony, so far as I have seen, usually, if not invariably, builds very near the surface, often so close that the paper covering may be seen without removing the soil; these would be easily destroyed with cyanide of potassium.

V. vulgaris, on the other hand, often traverse long tunnels, even a yard or two in moles' runs, and in consequence the cyanide of potassium would have very little effect on the colony, except the few at the

V. germanica, the largest and most destructive species, often have their nests deeper in the ground, and more frequently than the others build in open fields, and are consequently more accessible for using cyanide of potassium.

Wasps are very numerous this season, and the nests unusually strong in numbers for this time of year. I took a nest in the Easter week.—
J. HIAM.

ROSES AND THE VICTORIA FUND.

At the suggestion of the Directors of the Gardening and Forestry Exhibition a committee of ladies organised a Rose sale at the Earl's Court Exhibition on Saturday evening last in aid of the "Victoria" Fund. A number of stalls were arranged in the centre of the building around the band of the Hon. Artillery Company, and after eight o'clock a scene of busy excitement ensued. Although the idea was hastily developed upwards of £40 was realised. Among those who rendered valuable assistance were the Misses Milner, Mrs. and the Misses Dodson, and Mrs. Harry Turner.

ROSES AND ROSARIANS.

I AM very much indebted to "A Jubilee Rose Grower" for the interest he takes in my horticultural welfare. I perceive that the communication he has addressed to your columns has chiefly been inspired by my visit to Waltham. It may interest him to learn that I have just received a gratifying letter from one of the greatest of English rosarians, in which, with reference to that article, he says—"I have read with much pleasure your 'Visit to Waltham.' It is a production of very high literary merit, an oasis in the desert of horticultural literature, and marvellously accurate as to details." I could quote, if I had occasion to do so, from another distinguished horticulturist and successful author to a precisely similar effect. I hope you will permit me to say that my knowledge of modern Roses, such as Margaret Dickson, Mrs. Paul, Salamander, White Lady, Gustave Regis, Souvenir de S. A. Prince, Mrs. John Laing, Crimson Rambler, and Duchess of Fife, has been derived, not from the catalogue, but from practical experience, for though not an exhibitor at shows, I may claim to be a successful cultivator of Roses. In some instances I have written to their raisers regarding their parentage, which for the sake of perfect accuracy in description I was entitled to do. In my unconventional estimates of the value of these I have been independent and entirely conscientious. The characteristics which I have attributed to such Roses as those of the late Mr. Bennett, the Messrs. Dickson, Mr. William Paul, Mr. Cant, Mr. Cranston, and Mr. George Paul, are those with which I have become familiarised through the medium of careful and assiduous cultivation. Your correspondent has alluded to the National Rose Society. I have the greatest respect for that Association, whose President is my intimate personal friend. I think it would be a gain if anonymous contributions had a place elsewhere.—DAVID R. WILLIAMSON.

Your correspondent, "A Jubilee Rose Grower" (page 28), is, it seems to me, unduly severe on the articles on Roses written by the Rev. David Williamson. The latter has at least the courage of his opinions, as he signs his name to his articles, which your correspondent, "A Jubilee Rose Grower," does not. Moreover, Mr. Williamson's writings are enjoyable from the fact that they come fresh from the observations of a true lover of plants and flowers, who is keenly alive to all that is beautiful in Nature, if not educated (?) in all the technicalities and rules of the comparatively small number of Rose growers who are also exhibitors. Mr. Williamson draws direct from the garden that which too many of our writers on gardening gather from previous authors, from the frequenters of exhibition tents and committee rooms. It is amusing to find "A Jubilec Rose Glower," while questioning Mr. Williamson's accuracy, set up the N.R.S.'s new catalogue as an official guide. No Rose grower of taste, unless an exhibitor, would be influenced in his selection of Roses for his garden by this "official guide." It leaves out many of the best Roses for garden and house decoration, and recommends others that no one but an exhibitor would care to grow. But then it may be said the so-called National Rose Society is only an exhibitors' Society.—Audil Alteram Partem.

NATIONAL ROSE SOCIETY. PROVINCIAL SHOW AT WORKSOP.—JULY 13TH.

HISTORY seemed bent on repeating itself in one important and unpleasant particular in connection with the provincial Show of the National Rose Society at Worksop, and that was in providing a thoroughly wet and miserable day. Those who had the misfortune to taste the pleasures of the Chester Exhibition last year will remember the great downpour. But the worst did not come to the worst on Thursday last. After heavy showers in the morning the weather settled somewhat, and though dull was not so threatening as to prevent people coming out. The gratifying result was that in the afternoon the Show was crowded, and as the Exhibition of the Worksop Horticultural Society (referred to in another page) was held in conjunction with the Rose display, the visitors had value for their money.

The general opinion appeared to be that so far as the open and trade classes were concerned it was going to be a case of Harkness first and the rest nowhere, but in the amateurs' section there was a feeling of absolute uncertainty. A few bolder than the rest ventured a hesitating prediction or two, but they managed to hedge it round with so many qualifications that they were sure to be right whatever happened. The result was a complete surprise so far as the Jubilee class was concerned, an outsider in Mr. Whitton of Bedale coming in well ahead of the usual leaders, Mr. Lindsell in particular failing to get a prize. Somehow or other Mr. Pemberton also failed to display his customary interest in the welfare of the trophy. Another instance of the climatic see-saw, it will be said. Very likely; but for all that, 'twas a glorious victory. That both trade and amateurs' trophies should go to Bedale is, of course, a coincidence largely influenced by the season. Messrs. Harkness were not victorious without a struggle, for in the Jubilee and several other classes Messrs. Dickson & Son of Newtownards gave them a hard fight. In the former there was no doubt about the verdict, but in the class for thirty-six trebles many appeared to think that a mistake had been made, and that the Irish growers ought to have been placed first. The blooms were pointed up, however, and Messrs. Harkness & Son's flowers found by the Judges to be two points ahead; too close to be comfortable, no doubt. It was generally agreed that considering everything the Jubilee flowers made a marvellous display. The Palace winners had a really magnificent stand. How tenderly Mr. Harkness nursed it when he found there was no one to oppose him with seventy-two, and what a number of fine blooms he found he could dispense with in the latter! Mr. Merryweather, Mr. Mount, Messrs. Mack & Son all showed extremely well, as in the amateurs' section did Messrs. Whitton, Hutchinson, Machin, Mawley, Grahame, and Pemberton.

It can hardly be said that the Show was a completely satisfactory one—what "National" could be without the Cants, Mr. Prince, Mr. Burnside, Mr. Foster-Melliar, Mr. Berners, or Mr. Hill Gray? to mention only a few of those whose enforced absence was mourned—but it was a surprisingly good one considering the season. Let us hope that next year the crestfallen heroes will not be compelled, nolens volens, to leave the fray to others, but will once more show themselves worthy of places amongst the bravest and best. Mr. Mawley, Mr. D'Ombrain, Mr. Machin and others worked hard to get the Show ready for the Judges in good time, and were more successful than has sometimes been the case in the past. All honour to them.

The first of the nurserymen's classes was that in which the Jubilee trophy and £2 10s. constituted the first prize for thirty-six blooms. The Crystal Palace winners, Messrs. Harkness & Sons, were generally expected to repeat their southern victory, and they did so with a really superb stand, the flowers being large, richly coloured, perfectly fresh and clean. The varieties were as follows:—Back row: Mdme. E. Verdier (a grand flower), Mrs. Jowett (splendidly coloured), François Michelon, Camille Bernardin, S. M. Rodocanachi (very brilliant), Comte Raimbaud, Ulrich Brunner, Mrs. J. Laing, Earl Dufferin, Duchesse de Morny, Marie Rady, and Marie Baumann. Middle row: A. K. Williams, Maréchal Niel, Alfred Colomb, Madame H. Jamain, Horace Vernet (a splendid flower), Pierre Notting, Duchess of Bedford (very fine), Fisher Holmes, Hon. Edith Gifford, Prince Arthur (a grand flower), Comtesse de Nadaillac, and Chas. Lefebvre. Front row: Dupuy Jamain (splendid), Duke of Fife, La France, Reynolds Hole, J. S. Mill, Harrison Weir, Madame Haussmann, E. Y. Teas, Duke of Wellington, Countess of Rosebery (a beautiful flower, full of colour), Gustave Piganeau, and Exposition de Brie. Messrs. A. Dicksons & Sons, Newtownards, had a very fine stand, and one that deserved a better fate than the second prize in such a season; but they were well beaten by the Bedale growers for all that. They had some splendid flowers, particularly Général Jacqueminot, Mrs. John Laing, Chas. Lefebvre (although a little tarnished), Camille Bernardin, Catherine Mermet, Countess of Rosebery, Madame Eugène Verdier, Benoit Comte, President Willermoz, and Madame Hoste. Messrs. Mack & Son, Catterick, were a most creditable third, their blooms being smaller than the others, but very fresh and clean.

Absence of competition in the seventy-two class enabled Messrs. Harkness & Sons to concentrate their strength on the Jubilee class, and if the large stand was made to suffer somewhat in order to reinforce the quarter in which danger lay, it was not by any means weak, and comprised some very fine blooms, which, under the circumstances, it may be well to name, instead of going through the whole stand, and including the mediocrities in so doing. The best flower was a grand Horace Vernet, which the Bedale growers have shown very finely this year, and they were fortunate in having a still better one for the forty-eight. Mrs. John Laing was also beautifully shown, although a little marked by the weather. The same remarks apply to Fisher Holmes. Dupuy Jamain was a large and well coloured bloom, and so was Ulrich Brunner. Comtesse de Ludre was very rich, and Madame C. Crapelet, Général Jacqueminot, Prince Arthur, and Gustave Piganeau were also worthy of commendation, albeit the last named had its outer petals tarnished. First prize was awarded.

There was a close struggle between Messrs. Harkness and Dickson with thirty-six trebles, the Bedale growers eventually securing the award, but not by many points. Both were splendid stands. Messrs. Dickson had the cleanest flowers and the most variety, but Messrs. Harkness had the heaviest blooms. The latter were represented by Gustave Piganeau, Prince Arthur, Alfred Colomb, E. Y. Teas, Etienne Levet, Fisher Holmes, Comtesse de Serenye, Exposition de Brie, Dupuy

Jamain, Harrison Weir, Rosieriste Jacobs, S. M. Rodocanachi, Horace Vernet, Général Jacqueminot, Duchesse de Morny, A. K. Williams, H. Schultheis, Chas. Darwin, Pierre Notting, Reynolds Hole, La France, Duke of Connaught, Mrs. Harkness, Chas. Lefebvre, Pride of Waltham, Marie Baumann, Countess of Rosebery, Louis Van Houtte, Madame Haussmann, Marchioness of Dufferin, May Quennell, Dr. Sewell, Earl Dufferin, Marie Verdier, Mrs. John Laing, and Duchess of Bedford.

Mr. H. Merryweather, Southwell, won with thirty-six single trusses, and he had a very even, well-coloured collection, in which Duke of Albany, Mrs. J. Laing, Victor Hugo, Camille Bernardin, and Gustave Piganeau were particularly good. Messrs. Mack & Son were second with a very fair stand, Mr. Frettingham third, and Mr. Mount was awarded an extra prize. The best of three good stands of eighteen trebles came from Messrs. Mack & Son, whose Marie Baumann, Victor Hugo, Prince Arthur, and Général Jacqueminot were very good indeed. Mr. Merryweather was an excellent second, and Mr. Mount third.

The Jubilee trophy for amateurs brought several splendid stands, and the class was a noteworthy one considering the season. The premier award went out of the usual hands, falling to Mr. Whitton of Bedale. He well merited his victory, his flowers being in perfect condition. The varieties represented were—back row: Emilie Hausburg, Duchess of Bedford (a lovely flower), Mdme. Montet, Prince Arthur, François Michelon (weak), Comte Raimbaud, Marie Verdier, and Dupuy Jamain. Middle row: Ulrich Brunner, Rubens, A. K. Williams (a grand flower), Catherine Mermet, Dr. Andry, Innocente Pirola, E. Y. Teas, and S. M. Rodocanachi. Front row: Comtesse de Nadaillac, Camille Bernardin, Mrs. Laing, Alfred Colomb, Madame G. Luizet, Horace Vernet, Etienne Levet, and Victor Hugo. Mr. W. Hutchinson, Kirby Moorside, was second with a delightful collection, the only fault of which was that the flowers were rather light. Mr. H. V. Machin, Gateford Manor, Worksop, was third with a very good stand. The Palace winner, Mr. Lindsell, was altogether out of it.

There was also excellent competition with thirty-six single trusses, the Rev. J. H. Pemberton winning the piece of plate with somewhat small but clean blooms, the best being Mrs. John Laing, A. K. Williams, Horace Vernet, Comte Raimbaud, and J. S. Mill. Mr. W. Drew, Ledbury, was second with The Bride, Mrs. J. Laing, A. K. Williams, and a lovely Madame Hoste as his best flowers. Mr. Lindsell was third. Mr. Machin was the only exhibitor of twelve trebles, and was rightly awarded the first prize.

Division D was open to growers of less than 2000 plants. There were two classes, one for eighteen single trusses and one for twelve. Three competed with eighteen, and the first prize went to Mr. Whitton, the best blooms in a moderate stand being Prince Arthur, Duchess of Bedford, A. K. Williams, Catherine Mermet, and Alfred Colomb. Mr. Hutchinson followed with fair flowers, Duchess of Bedford being one of the best; and Mr. W. Boyes, Derby, was third. Mr. E. Mawley, Berkhamsted, was first with twelve, his flowers being small but extremely neat; Mrs. John Laing and Marquise de Castellane were perhaps the best. There was no other competitor.

In division E, for growers of less than 1000 plants, there were classes for twelve and nine. The former found Mr. C. J. Grahame of Croydon to the fore, his blooms being small, but the majority clean and fresh. Suzanne Marie Rodocanachi was a good bloom, although a little wanting in tone. Mr. Mallender, gardener to Miss Mellish, Hodsock Priory, Worksop, was second. In the other class there was only one stand, that of the Rev. F. H. Gall, Hitchin, and he was charitably awarded the first prize. Division F, in which there was a class for six single trusses, did not fill.

The local division brought out some very fair flowers. It covered a radius of thirty miles from Worksop Cattle Market, and consequently admitted Mr. Boyes, who defeated his solitary opponent, Miss Mellish, by a few points only, his flowers being much undersized. The best flower in either stand was Miss Mellish's Madame Eugène Verdier. Mrs. Jebb, Firbeck Hall, was the only one to stage a twelve stand, and was given the first prize; while in that for six Mr. H. Stewart of Carlton scored a bloodless victory. Competition was better with six Teas, Miss Jebb winning from three opponents with a very good stand indeed, her flowers being fresh and perfectly clean. The Hon. Edith Gifford and Marie Van Houtte were two of the best. Mr. Stewart was second with fresh flowers, and Miss Mellish third.

The extra classes for amateurs comprised one for six new Roses, one for six of any H.P. for exhibitors in divisions C and D, a similar one for those in divisions E, F, and G, and one for eighteen bunches of garden Roses. In the first the Rev. J. H. Pemberton was the only exhibitor, and was placed first for Gustave Piganeau, Caroline Testout, Duchess of Fife, Madame Delville, Marchioness of Dufferin, and Frances Bloxham. In the second Mr. Lindsell won with a moderate stand of Mrs. J. Laing, Mr. Whitton being second with Prince Arthur, and Dr. Budd third with Alfred Colomb. In the third Mr. Grahame won with La France, and Miss Mellish was second. In the fourth there were three excellent stands, much the best being that of Mr. Machin, who had Rugosa rubra, Mignonette, L'Idéale (beautiful), Paquerette, Gloire de Dijon, The Pet, W. A. Richardson, Damascena, Monthly, Anna Maria de Montravel, Red Pet, Salet, Rêve d'Or, Gloire des Polyanthes, Rugosa alba, and Perle d'Or in delightful condition. Mr. Pemberton was an excellent second, and Miss Mellish third.

Teas and Noisettes were not up to high water mark as a whole, but many were good. Mr. Merryweather scored in the only open class, which was for twelve trebles, and with one or two exceptions he had a

very good stand, for although the flowers were small they were in perfect condition. Mr. Mount was an excellent second. Messrs. Dickson & Sons won with eighteen in the trade class for that number, Messrs. Harkness & Son following. Both had good stands, but the Irish growers were well in front, their Marie Van Houtte, Madame Hoste, Madame de Watteville, and Francisca Krüger being beautiful blooms. Mr. Merryweather was first with twelve, again showing extremely well, his flowers being exceptionally fresh and clean. Ernest Metz was a splendid example. A capital box from Mr. Mount secured the second prize, and the third went to Messrs. D. & W. Croll, Dundee.

In the first division for amateurs, no specified number of plants, Dr. Budd of Bath won with a very beautiful box, the blooms displaying no exceptional size, but being extremely fresh and clean. Mr. Machin was a most creditable second. Dr. Budd was also first with six trebles, having another charming box, and Mr. Machin was the only other exhibitor. Mr. Mawley was first in the 500-plant section for nine blooms, Messrs. Grahame and Pemberton following. Mr. Mawley's was a box in his best style. Mr. Whittle of Leicester won with a neat stand in the 200-plant class for six; Mr. Whitton second, and Miss Mellish third. Mr. Machin won with nine of one variety, and Mr. Grahame with six, Mr. Mawley being second in the latter class, and Mr. Whittle

New Roses were splendidly shown by Messrs. Dickson, who won with Duke of Fife, Caroline Testout, Jeannie Dickson, Marchioness of Londonderry, Madame Delville, Salamander, Gustave Piganeau, Margaret Dickson, Le Flecheur (?), Marchioness of Dufferin, Kaiserin, Augusta Victoria, and Waban. Mr. Merryweather was second, and Messrs. Paul and Son third. For twelve of any yellow, Mr. Mount was first with a fair box of Maréchal Niel, and Messrs. Croll second with Marie Van Houtte. Messrs. Dickson won with La France in excellent order in the light pink class, Messrs. Harkness & Son being second with a bright box of Mrs. Laing, and Mr. Mount third with the same variety. Messrs. Mack & Son had the best twelve crimsons, winning with a splendid box of Horace Vernet. Messrs. Harkness were second with A. K. Williams, and Messrs. Dickson & Son third with Alfred Colomb. There appeared to be only two stands of dark velvety crimsons, and neither was good. Mr. Frettingham was placed second for Louis Van Houtte, and Mr. Mount third for Fisher Holmes. Messrs. Paul & Son had a pleasing stand of singles, and were awarded the first prize.

The premier Tea in the amateurs' class was a splendid Madame Hoste in Mr. Drew's second prize stand of thirty-six, and the premier H.P., a grand Mrs. J. Laing, included in Mr. Pemberton's first prize stand in the same class. The premier trade H.P. was Messrs. Harkness & Sons' magnificent Horace Vernet in the Jubilee thirty-six, and the premier Tea, a splendid Madame Hoste, in Messrs. Dickson's second prize box.

[As an ardent rosarian and one who has worked so assiduously in connection with the provincial show of the National Rose Society, we have much pleasure in publishing the portrait of Mr. H. V. Machin of Gateford, Worksop.]

ULVERSTON ROSE SHOW.—JUNE 10TH.

THE North Lonsdale Rose Society, which is affiliated with the National Rose Society, held its tenth annual Exhibition on the above date, and great public interest was manifested in it. Prizes to the value of £50 were offered, together with four bronze medals of the N.R.S. and a silver medal for Pansies. The Show was held three weeks earlier than last year, and would have suited many local amateurs had it taken place still earlier.

The nurserymen made an extensive display. Mr. B. R. Cant of Colchester was absent this year, the new comers being Messrs. R. B. Mack and Sons, Catterick, Yorkshire, and Mr. W. Frettingham, Beeston, Notts. They were not equal to the Irish representatives, Messrs. Alex. Dickson and Sons, the Royal Nurseries, Newtonards, who carried off all the first prizes in all the nine classes. Their exhibits were greatly admired, especially the new seedling Marchioness of Downshire, which was awarded the gold medal at the Crystal Palace. Messrs. Harkness, Bedale, took two second and a third prize; Messrs. R. B. Mack & Sons four seconds, also the prize for the best Rose in the Show with Horace Vernet.

In the amateurs' section J. H. Midgley Esq., J.P., Grange-over-Sands, took the leading prizes and gained the bronze medals for the best light H.P. bloom with Merveille de Lyon, and Souvenir d'Elise Vardon for the best Tea or Noisette. Mr. Midgley, however, withdrew his claim to the latter in favour of H. V. Machin, Esq., Vice-President of the N.R.S., another successful exhibitor. Mrs. Wm. Boulton, Ulverston, won the bronze medal in the dark H.P. class with Ulrich Brunner. The other classes were all well filled, and the Pansies were charming. The nurserymen judged the amateur section, and vice versâ. Altogether it was a grand show considering the season.—R. P. R.

[The "Herefordshire Incumbent" writes:—"In your otherwise wonderfully correct report of our Hereford Rose Show, considering my corrections and loose writing, I see the word 'would' is put for 'word,' in connection with Mr. Cant's name, and the word 'Noisettes' before the name of Caroline Kuster in the seventy-two list is obviously out of place. The reading should have been, 'Caroline Kuster (Noisette),' the H.P.'s then following in sequence." Mr. A. Whitton of Bedale also writes:—"In your report of Hereford Rose Show (page 38), the stand credited to Mr. Drew contained the twenty-four Roses with which I won first prize, also the medal for the best H.P., Pierre Notting. I was also winner of the twelve trebles and six Teas."]

A DESTRUCTIVE HAILSTORM.

The hailstorm mentioned in the Journal of July 13th (page 33) was only felt in a slight degree in this neighbourhood (Kirkbean), but from the local newspapers of July 12th it appears to have increased in severity in its progress in a northerly direction, and to have attained its greatest force in the parish of Kirkmahoe, a few miles north of Dumfries and near Amisfield. In the town of Dumfries a great deal of damage was done to glass, and, as was to be expected, nurseries and private gardens have suffered considerably. Mr. Jas. Service, Maxwelltown, had over 360 sheets of glass broken, Messrs. T. Kennedy and Co. over 150, and Messrs. Fotheringham & Co. a considerable number. Private establishments, such as that of ex-provost Lennox at Edenbank, where there were nearly 100 sheets broken, also received much damage in this way. The damage to fruit, flowers, and vegetables has also been very serious, as may be seen by this quotation from a local newspaper:—"Fruit trees were stripped to a large extent, and still greater loss was inflicted by the ice cutting holes in the Apples, Pears, and Plums which remained on the branches. They are thus practically destroyed, as they will rot on the tree. Vegetables were riddled as if with shot, and flowers in large numbers were broken and ruined for the season."

Great destruction has also been caused to farm crops, and young ducks and pheasants were killed by the hailstones. The account given

FIG. 9.—MR. H. V. MACHIN.

of the damage done at Carfield in Kirkmahoe, the residence of Dr. Williamson, is very dismal reading, but the following extracts will give an idea of the severity of the storm:—"One hundred and ten large squares of glass in the conservatories were broken. Some of these were one-eighth of an inch rough plate, and were further protected by a canvas blind." "The fruit crop is literally and entirely destroyed. Scarcely a single Apple, Pear, Green Gage, or Plum can be found, of those still on the trees, which is not chipped beyond hope of ripening. Leaves of Cabbage, greens, and Cauliflower are reduced to shreds; thick stalks of Rhubarb are split and twisted; Vegetable Marrows are completely wasted; whole rows of Peas and Beans are levelled, and the pods cut with hailstones." In the same parish one hailstone of circular shape, and not of exceptional size, is said to have measured 2 inches and a tenth in diameter. Such storms are of rare occurrence in this usually temperate district, and it is well that the area of its force was comparatively limited.—S. Arnott.

CARNATIONS AT PUTNEY HILL.

Amongst the best border Carnations I have seen this season are those at Red Brae, Putney Hill, S.W., the residence of Dr. W. S. Wyman. The plants, which are growing on a border facing due south, have made splendid growth, and an abundance of healthy layers with a profusion of flowers are the rewards they give for the generous treatment and concentrated attention they must have received both from the Doctor and his able gardener, Mr. Wheeler. The plants had not been disbudded to the extent to which the practice is carried by some growers, two objects being kept in view—good quality of blooms combined with large numbers. The flowers were of excellent form and substance, and this despite the fact that all the crown blooms and those immediately beneath them had been gathered. I was agreeably surprised to find such grand plants after the many small weakly ones which are so plentiful this season.

I will name a few of the best of those which were in bloom at my recent visit. First must be mentioned the well known Picotee Red Brae. This is a beautiful flower of fine shape; the petals are broad, and

the calyx very rarely splits, a point of the utmost importance in a garden such as this, where ringing is not practised. The ground colour is pure white and the edge a clear rosy purple, forming a charming combination. One of the best of the scarlets is unquestionably Lord Byron, the blooms of which are of exceptional size and of a rich striking The shape, too, is everything one could desire. James Cragg is a very beautiful fancy variety, having broad shapely petals, the colour of which is a dull white profusely spotted and flaked dark crimson. Constance is one of the best whites in the whole collection, the substantial blooms being of the purest white. Bely Cottle is a magnificant stantial blooms being of the purest white. Raby Castle is a magnificent flower with, so far as I can see, only one fault—it is inclined to burst its calyx, a serious drawback to such a bloom. The colour is a lively rose pink, and the flowers are very much fringed. The fine Rose Celestial is here in grand condition, blooming profusely and making strong healthy looking growth. Germania, perhaps the best of the yellows, is doing its grower every credit, as also is the popular Mary Morris. Ossian is a fine white flower, having fringed petals of much breadth and substance. Napoleon III. is an excellent variety, with brilliant scarlet flowers borne in the utmost profusion; not quite so bright in colour as the foregoing, but still bright, and of equal substance is The Coroner. Amongst other varieties noticed in the collection were Mrs. Reynolds Hole, Lord H. Pomeroy, Mrs. Fawcett, Mrs. Tegner, Alice Ayres, and three grand rows of the Old Crimson Clove, without which, no matter how choice the varieties, no collection could be termed complete.

Another excellent feature of this suburban garden is a charming little rockery, upon which nothing was more showy at the time of my visit than the Iceland Poppies. Some good Thymes were unfortunately just passed their best, as I should much have liked to have seen them; perhaps on the occasion of a future visit I shall be more fortunate.—

EVENTS OF THE WEEK.—As notified in another paragraph the Committees of the Royal Horticultural Society will meet at the Drill Hall, James Street, S.W., on Tuesday, July 25th. A special show of Carnations, Picotees, and other flowers will be held at the Gardening and Forestry Exhibition, Earl's Court, on July 26th and 27th. The Midland Carnation and Picotee Society will hold an exhibition in the Botanical Gardens, Edgbaston, on Saturday, July 22nd, instead of August 5th, as stated in the schedule.

- THE WEATHER IN LONDON.—The current week opened wet, rain falling heavily on Sunday morning. In the evening it cleared, and, with the exception of a slight shower, Monday proved fine but rather windy, as also did Tuesday. On Wednesday morning it was raining, and at the time of going to press it is dull and cloudy.
- —— ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Royal Horticultural Society will take place on Tuesday, July 25th, at the Drill Hall, James Street, Victoria Street, Westminster. The Fruit, Floral, and Orchid Committees will assemble at twelve o'clock, as usual, and at 3 P.M. a paper on "Alpine Houses and Plants" will be read by Mr. H. Selfe Leonard.
- THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We are informed that at the recent Bath Rose Show a large tent was set apart by the Management Committee for the use of members and friends of the above Institution, who were invited at five o'clock to hear an address from Mr. H. J. Veitch. R. B. Cater, Esq., presided, being supported by Mr. Ingram (Secretary of the Gardeners' Royal Benevolent Institution), Mr. William A. Garaway, Mr. B. R. F. Pearson, Mr. W. W. Jeffrey, and others. Mr. Veitch made a forcible appeal in support of the funds of this excellent Institution.
- HEDGES FOR SHADY PLACES.—It is often desirable to have hedges along lines where large trees are already growing. Among the best shrubs for this purpose, says "Meehan's Monthly," are the various varieties of Privet. They stand dry ground better than almost anything else. It is not so much the shade which injures the hedges in these situations as it is the drying of the ground by the roots of the trees. When we imagine the enormous amount of moisture transpiring from thousands of leaves of trees, we can readily see how dry the ground must be which has to supply this moisture. But those who have practical experience understand this without even a thought of the philosophy involved.

- THE REV. H. H. D'OMBRAIN.—We desire to record our deep sympathy—which will be shared by a host of friends—with Mr. D'Ombrain on the great loss he has sustained by the death of his beloved elder daughter. We know that her life was a noble and brave one, for it was consecrated to the good of those who needed succour—sufferers in institutions of which she was the devoted head. Mr. D'Ombrain's absence from many Rose shows, as well as from our columns of late, under the familiar nom de plume of "D., Deal," has been imposed by the illness of his daughter, which, to his great sorrow, terminated fatally. We shall hope to soon have something from his pen again.
- NATIONAL CARNATION SHOW.—Mr. M. Rowan writes:— In your enumeration (page 36) of the blooms shown in my stand at Chiswick, Alfred "S.B." is set down for "2." There were three scarlet bizarres shown—viz., Robert Houlgrave, Alfred, and Fred, and in appending the names to the flowers at the last moment I, in my hurry, wrote for the third one Alfred instead of Fred. The error was obvious enough, and the bloom was correctly named when shown in my twenty-four the next day at Earl's Court.
- EARLY RIVERS NECTARINE.—During a hurried visit to Sawbridgeworth a few days since, I noticed a fine crop of this new Nectarine just ripe on trees in pots. These were much in advance of Lord Napier grown in the same house, and better coloured. I counted twenty-six fruit on a tree in an 11-inch pot, all of which were fit for exhibition, which shows that it is a good cropper, and I consider it likely to become as great a favourite eventually as any of the varieties now before the public.—W. H. DIVERS, Ketton Hall Gardens, Stamford.
- —— Show at the Agricultural Hall.—As we have before announced, the Royal Horticultural Society will hold, from August 29th to September 1st, 1893, at the Royal Agricultural Hall, London, what the officials expect will prove to be "the grandest show of fruit, flowers, and vegetables ever held in this country." The amount of money offered in prizes exceeds £400, and this, it is considered, will attract nurserymen, gardeners, and lovers of fruit and flowers. Special awards are offered for heating apparatus, greenhouses, appliances, and other sundries, and in this division space is already being largely taken up. This section is under the direction of the managers of the Royal Agricultural Hall Company. Those desiring to secure space should make immediate written application for the same.
- EXETER GARDENERS' SOCIETY'S ANNUAL OUTING. The members of the Exeter Gardeners' Society held their annual outing on Wednesday, July 12th, combining, as usual, instruction with pleasure. The trip was to Sidmouth, making stoppages on the way at Streatham Hall, Exeter, Killerton Park, and Escott. At Streatham Hall the party was met by Mr. Franklin, head gardener to Mrs. R. B. West, who conducted them through. At Killerton the members were met by Mr. Garland, and under his guidance spent two hours in strolling through Sir Thomas Acland's grand old park. The pleasure grounds are very extensive and the walks charmingly arranged. The trees and shrubs are some of the finest in the West of England. At Escot, Sir John Kennaway accorded all a hearty welcome, inviting them to wander at will over the grounds and see all there was to be seen. Accompanied by Mr. Underdown, the head gardener, a hurried inspection was made of the gardens, the wilderness, and other parts of the park. Sidmouth was not reached until nearly half-past five, and an adjournment was made for dinner, after which the party returned to Exeter.
- FRUIT CULTURE AT WIGHTWICK MANOR, WOLVER-HAMPTON. - A Wolverhampton correspondent, Mr. T. B. Dobbs, writes:- "Mr. G. A. Bishop has proved the great advantage of a knowledge in chemistry applied to fruit culture, and the efficacy of well selected manures, by the production of three successive crops of fruit in pots, including Cherries, Plums, and Pears. There are several dozen trees in a line down the centre of an orchard house, every branch, from base to apex, being heavily laden with fruit according to the samples forwarded. These trees are only grown temporarily till the permanent Peach trees in the back and Nectarine trees in the front are sufficiently established, and will be removed this year. To get a combination of Pcaches, Plums, and an equally heavy crop of Cherries of all the best dessert varieties in the same house shows one of the highest forms of the cultivation of fruit, bearing in mind that the Péach and Nectarine trees are heavily cropped with fine fruit for the second time." [The samples of Plums are splendid-large clusters of fruit of the first size, and the foliage of the best possible description, the whole undoubtedly representing high-class culture.]

- GARDENING APPOINTMENTS.—Mr. W. C. Davis, for upwards of four years Mr. Clayton's foreman at Grimston Park, Tadcaster, has been appointed head gardener to Sir Andrew Fairbairn, Bart., Askham Hall, York. Mr. Richard Moore, the Gardens, Llanwern Park, has been engaged by Wm. Henderson, Esq., as gardener, at Berkley House, Frome, Somerset.
- COLEUS DISTINCTION.—Two beds of this distinct Coleus are now to be seen in grand condition at Messrs. Veitch's, Chelsea Nursery. The rich, dark, substantial foliage produces a very striking effect, it being next to impossible to walk through the nursery without giving it more than a passing glance.—H: W:
- PROPAGATING THE WISTARIA.—It is not generally known, remarks an American contemporary, that the Wistaria grows from root cuttings. Layering, however, is a very good method where there is room for it. The trailing shoots root by being buried in the ground a little, but better if a slit is first made in the shoot.
- WAKEFIELD PAXTON SOCIETY.—At the meeting of the above Society on Saturday evening Mr. W. E. Corden, who is well known as an amateur hybridiser, read a practical and interesting paper on "The Pelargonium." There was a collection of fine plants and cut blooms, and these were sold on behalf of the Royal Gardeners' Orphan Fund.
- THE WEATHER IN SCOTLAND .- At a meeting of the Edinburgh Botanic Society on July 13th, the Curator (Mr. R. Lindsay) observed that the past month was remarkable for the excessive heat and dryness which prevailed. The continued want of rain having lasted throughout nearly the whole of spring the marvel was that its effects had not been more serious on vegetation. A heavy fall of rain took place on the 23rd of the month, after which all danger from drought was at an end. The lowest reading of the thermometer during June was 40°, which was registered on the 2nd. On the night of the 16th the thermometer did not fall below 62°; the lowest day temperature was 50° on the 23rd, and the highest (89°) on the 18th of the month. Hardy herbaceous plants flowered freely, but went quickly past owing to the drought. The early flowering kinds had ripened from seeds abundantly. On the rock garden fewer plants came into flower last month than for any June during the last eleven years, the largest number having blossomed this year in May. In all 294 species and varieties came into flower last month.
- JAPANESE GARDENING. In a highly tasteful number of "The Studio" for July appears an interesting article upon the gardens of Japan by Mr. Charles Holme. The writer seeks to impress his readers with the fact of the intense admiration for Nature possessed by the Japanese. Their gardening is intensely artificial in the sense that they try laboriously to reproduce in miniature real, and in many cases ideal landscapes, differing in this respect from the Chinese, who stock their gardens with vegetation distorted into the shape of junks, pagodas, and other bizarre objects. He says, "Foreign plants, with the exception, perhaps, of a few characteristic ones from China, are not favoured by the Japanese; for they do not look upon their gardens as places to collect and display a variety of botanical specimens as in a nursery or arboretum; their idea is that the garden shall appear as a picture, complete in itself, each thing being in harmony with the rest, and forming, as it were, a part of a whole. The gardener in Japan is a sort of landscape painter, who uses actual trees, rocks, and water, instead of canvas, paints, and brushes. The picture he may form may be in imitation of some natural, well-known scene in his own country, or in China; just as though, if an Englishman, he might strive to reproduce the beauties of the Strid in Bolton Woods, or the Fairy Glen at Bettws-y-Coed. But often he takes for himself a theme of an abstract nature and eudeavours in his arrangements to express a sentiment, as of 'retirement,' 'meditation,' 'long life,' or 'fidelity.' In the majority of cases simplicity is aimed at rather than redundancy, as lavish display and vulgarity are synonymous in the Japanese mind." The perfect Japanese garden would seem to be one in which there is a waterfall, hills and glens, lakes and islands; stone lanterns incrusted with lichen, moss and leaves, shaped like a hat, a milestone, or a temple, and containing small oil lamps; a stone washing basin; bridges; curiously winding pathways of steppingstones, and summer-houses. In the absence of sufficient space, this multum in parro style will, one must suppose, somewhat resemble that of the Chelsea pensioner or the Broxbourne amateur. "The Studio" is a truly high art magazine, but we trust that it is not trying to imbue our æstheticised Englishwomen with a craze for Japanese gardening, otherwise unfortunate husbands who cannot extend their limbs in the drawing-room on account of the knick-knacks, gew-gaws, and bric-abrac, will soon find such relief equally impossible out of doors.

- WE are informed that Mr. M. CUTHBERTSON of the Public Park Nursery, Rothesay, was awarded a silver medal for 125 bunches of hardy flowers at the Royal Caledonian Horticultural Society. Also at Paisley, two days after, Mr. Cuthbertson had the same honour conferred for a similar exhibit.
- FUCHSIAS AND BEGONIAS.—One of the most attractive houses at Messrs. Veitch's at the present time is that containing some excellent Begonias, Zonal and Ivy-leaf Pelargoniums, and Carnations on the stages, with Fuchsias of various types trained up the roof. On entering the house one is met with a truly gorgeous display of colours which cannot fail to attract attention and admiration from all who see it —H. W.
- THE WEATHER IN JUNE.—June was a dry month, but not so bad as the preceding, as we had three good showers. The wind was in a northerly direction twenty-one days. We had sixteen bright days, three of which were clear. Barometer varied considerably. Highest reading 30.44, at 9 A.M. on 18th; lowest 29.35, at 9 A.M. on 23rd. Total rainfall 1 inch, which fell on nine days, the greatest daily fall being 0.31, on 22nd. Highest shade temperature 87°, on the 19th; lowest 36°, on 1st; lowest on grass 26°, on the 11th. Mean daily maximum, 71.90°; mean daily minimum, 48.43°. Mean temperature of the month, 60.13°. The garden spring ran 20 gallons per minute on the 30th.—W. H. DIVERS, Ketton Hall Gardens, Stamford.
- THE annual banquet of the Worshipful Company of GARDENERS was held at the Hôtel Métropole on the evening of the 12th inst. The Master, the Rev. W. Wilks, assisted by the Upper Warden, Mr. Beaumont Shepheard, received the guests, who numbered about eighty, half of whom were ladies. After the usual loyal toasts had been given by the Master, Sir Trevor Lawrence proposed that of "The Ladies" in glowing language. He commented on the pleasing innovation betokened by their presence, and hinted that considering man owed to woman his exclusion from the finest garden ever knownto wit, the Garden of Eden-man was very forgiving. Colonel Dampier Palmer, M.P., responded, and incidentally remarked that it was usual to select a bachelor in preference to a married man for this purpose, because on the principle followed in the House of Commons, he spoke from imagination rather than from knowledge. Consequently the Master could have discharged the function better than himself. Mr. Harrison Weir then proposed the toast of the evening, "The Worshipful Company of Gardeners." He dwelt, among much else, on the pleasure received in perusing the old authorities on English horticulture, on the connection between the plant world and decorative art, on flowers as a medium for expressing amatory sentiment, and the modern craving after excitement as shown in the cultivation of the unrestful Orchid. The Master, the Rev. W. Wilks, whose name was coupled with the toast, replied stating that the Company dated its origin from the reign of James I., that it was doing good work in the promotion of horticultural education, and viewed gratefully the generous donation of scholarships for this purpose by Sir Trevor Lawrence and Baron Schröder. Other toasts were honoured, and the proceedings of the evening agreeably diversified by both instrumental and vocal music.

REVIEWS OF BOOKS.

The Garden's Story. By George H. Ellwanger. London: William Heinemann.

From Mr. Heinemann there has come to hand an English edition of this very agreeable book. It is somewhat in the nature of an édition de luxe, prettily bound in light green, and well suited for display within the boudoir or the drawing-room. Not the least interesting portion of the volume is the introduction by the Rev. C. Wolley Dod, a careful perusal of which is indispensable to the understanding of the following pages. Indeed so interesting is it that we venture to reproduce a considerable part of it here, feeling quite sure that the terse and picturesque summary of the contrasts between the Old England and the New will excite a relish for the body of the work.

The scene of the book is the neighbourhood of Rochester, in the State of New York. It is situated on the southern shore of Lake Ontario, about sixty miles due east from the Falls of Niagara, and separated by less than that distance from the Dominion of Canada across the lake; a line of 150 miles may be drawn to Toronto. Canadian territory extends some hundred miles to the south of the latitude of Rochester, so that what we read in this story may be applied to a considerable part of British America. Our friends in that region have to deal with hardy plants under different conditions from those which prevail in our insular climate. Theirs is always a real winter, and the ground is not fully thawed until our spring flowers have been flowering in driblets for about two months. Hence it happens that spring flowers across the Atlantic come in a heap, and though there may be for a day or two a relapse into winter the early flowers there have a

wonderful power of resisting frost: indeed, we may sometimes see in our own flower beds Trilliums, Tiarellas, Uvularias holding up their heads without flinching on the coldest day that the end of a British April can bring, when every Daffodil is doing obeisance with its face on the ground. So the gay burst of spring, which is too often a mere poetical fiction with us, is a reality in North-America, though it may come late. The hot summer which soon follows brings many things which remind us of descriptions of tropical countries. Humming birds hover about the flowers in the sun, the Honeysuckles at dusk are crowded with the great Sphink Carolina, and fire flies blaze all night. The great heat favours the maturation of some plants, which rarely complete their cycle of growth out of doors in our short and doubtful snmmer, though from the same cause drought is more destructive there to the beauty of the garden. The Alpine plants, natives of high elevations in mountains of Europe and Asia, though the long and regular winter would favour their cultivation in the lowlands near Rochester, seem for the most part incapable of enduring that dry beat.

elevations in mountains of Europe and Asia, though the long and regular winter would favour their cultivation in the lowlands near Rochester, seem for the most part incapable of enduring that dry beat.

The colloquial names of flowers, many of them perhaps new to the reader, with which the story abounds, need not be explained here, because they are accompanied at least once in the book by the botanical Latin name, and a very complete Index enables us to refer with ease to the page where the name occurs. Hence such names as Partridge Vine—it may be noticed by the way that nearly all trailing plants are called Vines in America—Spring Beauty, Butterfly Weed, call for no comment. But the popular names of birds introduced without the addition of their scientific synonyms may puzzle those who know nothing of American ornithology, and who may like to learn what are the familiar feathered friends or enemies of the gardener on the shores of Lake Ontario. One bird seems to be the same everywhere in its wicked propensities, the cosmopolitan "English" sparrow (why "English," more than Russian, or French, or Turk, or Prussian?); but our friends insisted on having it sent over to them in spite of our warning, and though they repent of their bad bargain, and call the bird a little wretch—

"O factum male! O miselle passer!"

they must keep it now, and we heartily wish they would take the rest too. Many other birds are introduced, such as wrens, nuthatches, swallows, and martins, crows, orioles, and plovers, which though distinct in detail from their Old World representatives, are sufficiently near to make the allusions to them consistent with our experience; but in one or two cases it is not so; for instance, the first English settlers gave the name of Robin to a migratory kind of thrush (Turdus migratorius) with a red breast, a songster, but not a winter resident near Rochester, and therefore hardly suggestive, except in name, of the half domesticated little frequenter of our sheds and window ledges which sings to us all winter, and seems rarely to venture beyond the limits of its native shrubbery. Another ambiguous name is Blackbird, given in the North-Eastern States to the red-winged starling (Agelæus phæniceus), a gregarious and migratory bird, very destructive to grain crops, and breeding amongst the reed of marshes, having but little in common with our "ouzel cock," so black of hue, which warbles, eats, and dwells in our evergreens and orchards.

About other birds introduced, it may be acceptable information to some who do not know it already, that the chickadee is a titmouse, the bobolink or rice bird a migratory large bunting with a plumage of black, white, and yellow. The hair-bird is the hairy woodpecker, which, like our native green woodpecker or "rain-bird," is noisy before rain. The pee-wees (or peewits) are flycatchers, and the cat-bird—so called from the likeness of its note to the mewing of a kitten—is a dark-colouned thrush. The grackle or crowblackbird is an omnivorous and gregarious noisy depredator, something between a jackdaw and a starling. Such names as blue-bird—a bird about the size of our robin—and yellow-bird, a kind of goldfinch, while suggestive of tropical feathering, sufficiently explain themselves. To compare the garden birds of two countries, one ought to have resided in both; but, after consulting those who know, I conclude that in the matter of song the balance is in favour of the old country, while the Northern States of the New World have more gay plumage to admire in spring and summer.

The main portion of the book consists of fifteen chapters, each bearing a poetical or seasonable title, and couched in the form of a running monologue or soliloquy upon the panorama of natural incidents unfolded during one year. Early spring is dealt with under the title of "The Garden in Anticipation." We are introduced to later spring in the chapter entitled "When Daffodils Begin to Peer," while such headings as "Warm-Weather Wisdom," "Midsummer Flowers and Midsummer Voices," "Flowers and Fruits of Autumn," and "The Last Monk'shood Spire," suggest the inevitable progression of the seasons. It is from every point of view a most refined and desirable publication—a worthy successor to the works of White and Jeffries—and eminently suitable as a gift-book between naturalists and lovers of horticulture.

British Fungus Flora. By GEORGE MASSEE. London: George Bell and Sons.

We have to acknowledge the receipt of the above text book. The work is in two volumes, and is a model of excellence in respect of the clearness of its type and solidity of its binding. In a short preface Mr. Massee indicates to us the vast strides which have been made in the diagnosis and differentiation of fungus species during the last twenty years, these having almost doubled so as now to number nearly 5000. In the present work, however, Mr. Massee confines himself chiefly to the description of the Basidiomycetes and the Ascomycetes, leaving the Moulds and Mildews for those who choose to make a closer examination of the subject in his other work entitled "The Evolution of Plant Life: Lower Forms." The meaning of this is that the fungi dealt with and depicted in the pages of the book which we are noticing are those having a visible stem, or at least a visible pileus, such as we are accustomed to see in the common Mushroom, and many of which strike the eye of even ordinary observers as they adhere to the branches, trunk, collar, or the

roots of trees, or to posts or fences, or as they appear upon dunghills, rubbish heaps, and about swamps and plantations.

To the universalist, the revelation of the enormous vista to be opened up by mycological investigation is somewhat staggering, and must excite something like a feeling of despair at the brevity of life. If art was long and life was short in the days of Horace, what will be the relative importance of a life even like that of the late M. Chevreuil, in the face of the ultimate revelations of telescopy and microscopy? Perfect happiness will then only be enjoyed by the absorbed specialist, and men of science will spend a lifetime in the contemplation of a spot in the heavens invisible to the naked eye, or of the mould which gathers upon a particular kind of strawberry jam. One thing is certain, however, that the pleasure of a subject increases proportionately to the mental concentration with which it is pursued, and the consideration of fungiduring a perusal of Mr. Massee's book is pleasant even to a mind hitherto occupied with the more visible and striking beauties of phanerogamous plants. One fact impresses the reader, and that is the interdependence of organic life and the further revelations foreshadowed by science of the sequences which prevail upon our planet. It is in the highest degree interesting to read of the affinity certain parasitic fungi show for particular trees and particular situations, and induces the mind to expect and hope for an ultimate solution of the puzzle of creation. Whether this ever arrives or not, such investigation is at least a more profitable mental manifestation than the old-fashioned way of regarding each disjointed fact as an accident or a miracle. It is permissible even to look forward to a time when the unravelling of scientific problems may become of as absorbing interest to young persons of the future as charades and guessing contests are to those of the present day. "The British Fungus Flora" is the result of an exhaustive comparison of the best known authorities upon the subject, and it may be confidently recommended as a work of study and reference to those interested in mycology.

A NEW LILIUM.

At the Exhibition held in the Gardens of the Royal Horticultural Society at Chiswick on July 11th, considerable attention was centred on a new Lilium exhibited by Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, and Messrs. Wallace & Co., Colchester. The first mentioned firm exhibited it under the name of L. Ukeyuri, and the latter showed it provisionally as L. Alexandræ. A first-class certificate was awarded in each case; but in the latter instance subject to the Lilium being correctly named by Mr. Baker of Kew, who, so far as we can at present ascertain, considers it, on a cursory examination, to be a garden hybrid. Messrs. Veitch, on the other hand, as already hinted, exhibited it as a species from Japan, and according to the rules of the Royal Horticultural Society, which give precedence to those who enter an analogous exhibit first, we illustrate it (fig. 10) as L. Ukeyuri.

From a decorative point of view it is a grand Lilium, and one that will doubtless become as popular as L. auratum. It is a dwarf grower, being less than 18 inches in height, and some of the plants exhibited bore three flowers. The blooms, as will be seen by referring to the illustration, are very large, pure white, and of great substance. It is unquestionably one of the finest and most beautiful Liliums yet introduced.

GRIMSTON PARK, TADCASTER.

In many respects Grimston Park may claim a high place amongst the stateliest of the "homes of England." A noble mansion is associated with splendid grounds and a magnificently timbered park. The flower garden merges almost imperceptibly into the woodland, sharing in some measure its cool, reposeful aspect. If the Italian style, so conspicuous in the house and its immediate surroundings, should fail to prove satisfying—and consider it artificial, there is ample compensation in the bright pictures, painted by Nature's own prodigal hand, which abound in the immediate vicinity. The mansion was not built for Mr. John Fielden, who died recently, but for Lord Howden, and the architect was Decimus Burton, while the garden and grounds were laid out by Nesfield. How the work of the twin artists compares it would require the architectural knowledge, the deep artistic sympathy, and the literary skill of a Hardy to explain. But if the higher plane to which the accomplished author of "A Laodicean" would raise such a description is denied to a gardening writer he can at least make some acknowledgment of the many good features of Nesfield's work. The formalities peculiar to the Italian style of the flower garden melt away along the winding walks which lead to the wilder portions of the grounds, and in the broad belts of Conifers and forest trees, the shrub-covered banks, the cool recesses, the Fern-clothed undergrowth, and the profusion of wild and naturalised flowers, there is a store of interest and pleasure which grows the more closely it is examined.

In the garden proper statuary and flowers dispute attention. The beds are numerous and attractively filled, and at the right of the house is a beautifully furnished Rose garden. The latter is backed by a belt of Oaks, Sycamores, Copper Beeches, and other trees. The last-named are magnificent specimens, and in the evening glow their leaves are tinged with Coleus-like hues unique and pleasing to the eye. Valuable

marbles gleam amongst stately Conifers. The boar in the Borghese garden at Bologna is represented by a stone of great value, and from it the eye wanders to one of the finest specimens of Thujopsis dolabrata north of the Trent, 20 feet high or more, and admirably proportioned. Or, again, an almost priceless Figure of Europa divides attention with a noble Lawson's Cypress 40 feet high and a grand tree of Thujopsis

grounds disclose many objects of interest when pursued. Thousands of Narcissi are established in the grass, and in the spring they add their own peculiar charm. Huge bushes of the Mock Orange diffuse their powerful fragrance. One of Philadelphus grandiflorus 15 feet high and 10 feet through was a wonderful sight, being completely wreathed in flowers. A picturesque effect is added by the lofty Scotch

FIG. 10.—LILIUM UKEYURI.

borealis with an altitude of about 30 feet. There is no limestone in this portion of the grounds, and Rhododendrons as well as Conifers thrive well. Laurels are as luxuriant as at Swanmore, and there must be two or three acres of them in different parts of the estate; rotundifolia and caucasica do best.

The winding walks which lead to the undressed portion of the

Firs, with their heavy mantles of Ivy, supplemented in some instances by clustering masses of wild Roses, the pink blossoms of which break from the cool Ivy slopes in myriads. One of the most beautiful spots in the grounds, or, indeed, in any garden in the country, is the Emperor's walk, so called from the lines of busts of some of the most famous and infamous of the old Roman and other potentates on each side of it. The

marbles are magnificent pieces of work, and doubtless their value is great, especially the figure of the great Napoleon, a costly and superb piece of work in Carrara marble, but a gardener's eye is quite likely to wander from them to the grand Conifers, ornamental trees and lofty timber in their vicinity. The forest trees at the back are noble timber in their vicinity. The forest trees at the back are noble examples—and amongst the Conifers in front of them I would particularly mention Abies orientalis 25 to 30 feet high, A. Kutrow, an Indian species about 20 feet, Picea Pinsapo, and P. Cembra, both about 20 feet, together with Cryptomeria japonica 30 to 40 feet, and Cupressus Lawsoniana about 30 feet, all of which are extremely handsome specimens.

The grounds at the other end of the house are little less attractive, rich as they are in fine forest trees and Conifers. Corsican Pines are amongst the most remarkable. In reaching there what is known as the Church Walk is traversed, and the first portion of this is flanked by a border of hardy plants, with a long wall covered with summer Roses at the back. The latter were smothered in flowers, clustering in thick masses right on to the top of the wall. The herbaceous plants consisted of broad clumps, most of them a yard across or more, such bold and brilliant flowers as Pæonies, Hemerocallis flava, Spiræa plumosa, Inula glandulosa, Delphiniums, Geraniums, Centaureas, Potentillas, and Campanulas of many sorts being represented by huge masses. not be much interest in such a border as this, consisting of more or less common plants, to hardy plant specialists, but its effect is undeniable.

A somewhat brief reference must be made to the ornamental department under glass, which is in every way as well managed as the gardens and grounds. The conservatory was under revision, but a remarkably fine pair of Rhapis flabelliformis, 10 feet high and 7 to 8 feet through, were noticeable; also a lofty Seaforthia elegans, 30 feet high, in flower, and some immense Camellias. Later the structure, which is a very spacious and lofty one, will be embellished by the noble spikes of Campanula pyramidalis and other plants, now rapidly advancing, and in autumn it will be gay with Chrysanthemums. There is a feature about the plant houses at Grimston which is well worth copying. No bare space is permitted at the sides of the paths and beneath the stages, but all is attractively covered with such graceful plants as Fittonias, Panicum variegatum, Tradescantias, Cyperus alternifolius, Selaginellas, Panicum variegatum, Tradescantias, Cyperus alternitolius, Selaginellas, and a variety of Ferns. How great an improvement this is upon the ordinary plan can only be realised by seeing Mr. Clayton's work. The houses are, so to say, finished. One of the most beautiful of the structures is that in which an attempt is being made to combine a cool Orchid house with a fernery. The Ferns are not grown in pots on a stage, but cover banks and nooks in a natural and graceful manner, besides clothing the back wall, in association with Selaginellas, in a cool garment of greenery. No special attempt is made to produce specimen garment of greenery. No special attempt is made to produce specimen plants, but a few giants are noticeable, amongst them being a Davallia Mooreana about 9 feet across. Orchids are extremely well managed. There are from 300 to 400 Calanthes in a healthy and forward condition, besides a good assortment of Cattleyas, Cypripediums, Pleiones, Thunias, and others. It would be impossible to refer individually to all the stove and greenhouse plants which are represented, but throughout there is evidence of good culture and exceptional taste. At the front of one of the houses, on a warm border at the foot of the wall, and facing south, I noticed a grand mass of Guernsey Lilies. They are thoroughly established and bloom most profusely, in fact a score of flowers may be cut at a time instead of the ones and twos which are obtainable from the usual handful of plants in pots under glass.

Some surprising results have been recorded amongst fruit and vegetables; for instance, Potatoes were lifted from a south border without protection on the 26th of May, which is a striking proof of the earliness of the season considering the northern locality. Strawberries (Noble) were gathered at the same time. The Apple crop is somewhat disappointing, for there was a marvellous show of bloom, Lord Suffield, Irish Peach and Yorkshire Greening being about the only three to carry a really satisfactory burden of fruit. A dwarf, spreading, open type of tree is favoured. The famous Sherburn Winesour Plum (for which as much as a guinea has been paid for a stone of fruit from the limestone) is bearing well. A south wall furnished with Peaches, Nectarines and Plums is worth noticing. Condor proves to be one of the most useful of the Peaches, ripening three weeks before the other varieties. Apricots are loaded with fruit, and St. Ambroise is the most trustworthy variety. It is an excellent sort, cropping well, displaying no desire to die off, and being of good quality, though hardly equal to Moor Park. The Peaches and Nectarines under glass are in splendid condition, Bellegarde, Grosse Mignonne, A Bec, Early Albert, and Prince of Wales being a few of the elect. The Vines are equally good. Mr. Fielden favoured the Frontignans, and these, as well as the more popular varieties, are carrying admirable One house of Frankenthal, bearing the usual complement of about 200 bunches, is particularly striking. The kitchen garden is extensive and well cropped. Grand Brussels Sprouts are secured by planting them 2 feet apart between rows of early Potatoes 3 feet asunder, the soil being tilled around the sprouts after their associates are cleared A dressing of wood ashes and night soil encourages splendid crops of Onions, 1 ton and 70 lbs. having been taken off about 270 square yards of ground last year, and the present year's quarter is equally promising. There is, in fact, the impress of good work in every department at Grimston, and in the present notes many things have been lightly touched on which merit special notice, but even with the season of Rose shows practically over space is not too abundant.

Without a doubt Grimston Park may be ranked amongst the leading places of the land, and Mr. Clayton as one of the foremost British gardeners.—W. P. W.

BARLY FLOWERING CHRYSANTHEMUMS.

THOSE who grow the early Chrysanthemums can scarcely be other than satisfied with the way in which the plants are flowering this year. Those which I grow on borders are covered with bloom, Early Blush being particularly good. This is a grand old early flowering variety, and one that should be extensively grown: It is a favourite in many suburban gardens in the north of London. The yellow and white varieties are, however, more attractive, and of these a good selection might be made.—SUBURBAN.

NATIONAL CHRYSANTHEMUM SOCIETY'S ANNUAL OUTING.

FOLLOWING a thoroughly wet day it was generally thought, when the morning of the 17th inst. opened dull and cloudy, that the annual picnic and outing of the members of the National Chrysanthemum Society would be somewhat a failure. Fate, however, ruled otherwise, and as the black clouds rolled by the sun shone brilliantly on the "Mum" growers and their friends who had burdened themselves, wisely, perhaps, if too well, with umbrellas, macintoshes and other safeguards against rain. The outing was a decided success from a numerical point of view, and the officials of the N.C.S. must feel gratified with the result. Thanks to the energies of Mr. R. Dean, the Secretary, the arrangements were carried out in a most efficient manner, and all who availed themselves of this opportunity for a pleasant run in the country

spent a most enjoyable day.

As previously announced in these pages, Wycombe Abbey, High Wycombe, Bucks, the beautiful seat of the Right Hon. Lord Carrington, was the place selected for this year's picnic, and the parties were conveyed thither by the Great Western Railway on Monday last. A long programme had been arranged, and among other things was a cricket match between members of the N.C.S. and the Aylesbury Floral and Horticultural Society. This started at eleven o'clock, so to enable the players to be on the ground promptly a party accompanied by Mr. Dean left Paddington Station at 8.20 A.M., the other section following at 11 A.M. On previous years the party has usually numbered about eighty, but on this occasion there were at least 150. Arriving at their destination the visitors explored the grounds, gardens, and watched the cricket match, which proved a most exciting if not particularly brilliant game. Those of our readers who are cricketers will be interested to know that the N.C.S. team was beaten by seven wickets. In the first innings neither side scored very heavily, but the bowling of Mr. Agate, the well-known Havant Chrysanthemum grower, deserves more than a passing reference. Playing for the N.C.S. team this bowler, who obviously is as much at home in the cricket field as among his Chrysanthemums, took no less than six wickets at the cost of one run—no mean feat. Some of the opposing team also distinguished themselves in the field.

An excellent dinner was served in the large Hall adjoining the Abbey by Mr. F. W. Miles, and this was presided over by Mr. Dean. Justice having been done to this by the excursionists, the loyal toasts were proposed and drunk, following which came the toast of "The Health of Lord Carrington." This was briefly proposed by Mr. R. Ballantine, and Mr. Miles, the head gardener at Wycombe Abbey, responded. Mr. Dean gave the "Aylesbury Floral and Horticultural Society" coupled with the name of Mr. Fowler the Contain of the Society," coupled with the name of Mr. Fowler, the Captain of the Aylerbury cricket team, who responded. An adjournment was then made, the cricketers to resume their match, and the rest of the party to wander over the grounds and neighbourhood. Many went to Hughenden Manor, the residence of the late Earl of Beaconsfield, which is about two miles distant, but here disappointment—the only blot in the day's programme—awaited them. After exploring the pretty church at Hugh-enden, which, by the way, is of great historical interest, some of the party proceeded to the Manor House with the object of seeing the Here, however, they were met by the present proprietor, who informed them that, owing to his not having received an intimation of their visit, he was unable to allow them to view the grounds, which apparently are rich in Conifers. Returning to High Wycombe, a visit was made to the chair-making factory of Mr. W. Birch, who kindly conducted the party over the premises and explained the details connected with his extensive business. This was one of the most interesting features in the day's programme, and those who failed to see the factory missed a treat. Seats of every conceivable kind are made here in thousands, and complete "antique" chairs are turned out in hundreds by the aid of modern machinery!

During the afternoon, too, an exploration of the gardens and grounds of the Abbey was made. The pleasure grounds and park are of an undulating and picturesque character, and, moreover, well wooded. The common Beech seems to thrive remarkably well on the dry chalky slopes, and on the lawn there are two exceedingly fine specimens of the Copper Beech. Some large trees of Platanus orientalis also attract attention on entering the grounds, and the same may be said of the Elms, which are very fine. Bedding is not extensively done, but the Abbey is partially

covered with various climbing plants, including Ampelopsis, Ivy, Roses, and the Grape Vine. An old orangery near the house is of exceptional interest, although Nature holds the sway on this beautiful place, but few attempts at artificial decoration being noticeable. In the gardens Vines, Peaches, and Cherries are evidently well cared for under glass, and fruit is extensively grown in the open air. Vegetables, too, form a feature, and it would appear that flowers for cutting are required in bulk. Carnations are extensively grown, as also are other plants that give an abundance of blossom. At 6 P.M. visitors partook of tea in the hall, and at 8 P.M. most of them assembled at the railway station on the homeward journey, evidently tired but satisfied with their day's outing.

HORTICULTURAL SHOWS.

WOLVERHAMPTON.—JULY 11TH, 12TH, 13TH.

THE character of the Roses exhibited on the occasion of the great floral fête held in this busy Midland town was indicated last week, and the names of the successful competitors in the chief classes recorded. There was, however, a great and meritorious display in other sectionsspecimen plants, groups, flowers, fruit, and vegetables, to which reference must be made without any pretence to giving a detailed report and full list of prizewinners. This would be too exacting on space during a period of pressure, while a great deal of the matter would possess local interest only. It is true the Wolverhampton Shows are local, but it is equally true they are much more than this, for the more important classes are open to all comers; and so great have been the successes during past seasons, that in the course of five years the floral fête has won for itself an honourable position among the great provincial gatherings of the kingdom. This is due mainly to a generous, yet well-considered policy adopted by a Committee of large views and business capacity, whose services are recognised by the municipal authorities as well as by the inhabitants of the town and surrounding district. The Mayor of Wolverhampton (T. C. Mander, Esq.) is President of the Society, and takes an active interest in its prosperity. In response to his invitation the town was decorated from end to end, and everything was joyous—till the rain came down.

The rain! It was not a drizzling that fell at wide intervals, but exactly the reverse, for the rain almost came down in sheets, and only the best of tents could have afforded shelter from the downpour. The canvas was, however, good, and a large extent was necessary for accommodating the exhibits. Five marquees, each apparently 150 feet long or more, and 40 or 50 feet wide, were well filled in every case. But what of the officials? They must not be pictured with doleful countenances. "The rain would do good, the Treasurer was well fortified, the weather would clear and the crowds come before the three fête days were over.' That appeared to be predominating theme, and a more cheerful body of officials were never seen under the watery circumstances, but they had their equal at Woodbridge in Suffolk three days later; of that, however, more anon, and we will now take a glance at some of the Wolverhamp-

ton exhibits. Specimen Plants and Groups.—Of these there was a wonderfully fine display, as there ought, considering that close upon £80 were offered in the two classes. The first was for sixteen stove and greenhouse plants, not less than eight in bloom. When it is said that Mr. Cypher put forth his full strength it will be conceded there was something to see. He won the £20 prize with a grand collection. His chief flowering plants were Erica Parmentieriana rosea, a huge fleecy mass; Kalosanthes coccinea, a glowing semi-globe; Allamanda nobilis and Statice profusa like a huge bouquet. The foliage plants were also noteworthy for size and excellence. The second prizewinner, Mr. Finch, gardener to J. Marriott, Esq., Coventry, was a powerful antagonist, and well won the £15 with, among others, a symmetrical and densely flowered example of Erica impressa, a large Aphelexis and still larger Ixora, with a neat Allamanda grandiflora, fine Palms, and a splendid specimen of Croton Morti. Mr. Dyer, gardener to Mrs. Marigold, Edgbaston, won the remaining prize of £10 with a highly creditable assortment. Messrs. Cypher and Finch were the respective winners in the class for six flowering plants with fine examples. In foliage plants the first-named exhibitor was prominent, his Croton angustifolius, 8 feet in diameter, resembling a fountain of gold. In the class for six exotic Ferns, Mr. R. Sharpe, gardener to J. Lovatt, Esq., Bushbury, was the premier exhibitor with large and admirably grown plants, Mr. Dyer following—a strong second. Among the six Orchids with which Mr. J. Palmer, gardener to Wm. Bown, Esq., Birmingham, won the chief prize, was a remarkable plant of Epidendrum prismatocarpum with twenty-seven vigorous spikes and hundreds of sparkling flowers. This plant was in consideration for the medal offered for the gardener's or amateur's exhibit that displayed the best culture in the Show, but Mr. Finch's great and good contribution of specimens overwhelmed it. Mr. Palmer also had Cattleya Sanderiana in admirable condition.

Groups.—Prizes of £15, £10, £5, and £3 were offered in the open class for plants arranged for effect in space not exceeding 450 square feet. There were five competitors, whose collections were arranged down the centre of a large tent, and produced in the aggregate a picturesque display. Mr. Cypher was the premier exhibitor with a somewhat diamond shaped arrangement. The ground was covered with Adiantum cuneatum, forming a level surface, in which was lightly dotted small Palms, Crotons, and Orchids. The four corner points of the diamond each contained larger Palms and Orchids, and in the centre was a bold free mound of Hydrangea paniculata in a groundwork of Ferns, surmounted by a graceful specimen of Phænix rupicola. It was a charming arrangement without the least suspicion of crowding, every plant showing itself fully, and all good. The second prize was well won by Mr. Francis Denning, Moseley, Birmingham, with a somewhat similar shaped group, but with more points—no improvement. Libonias were effectively disposed with Palms, Liliums, Crotons, Caladiums, and Statices amongst Ferns. A good group but rather crowded. Mr. W. H. Dyer was third with a richly coloured group of well grown plants, but rather too many of them. The fourth prize was won by Mr. J. Wright, nurseryman, Wolverhampton, who also employed too many plants.

Prizes of £6, £4, and £3 were also offered for groups not to exceed 400 square feet, open to gardeners in Staffordshire, Worcestershire, Warwickshire, and Shropshire. Mr. W. A. Powell, gardener to G. H. Kenrick, Esq., Edgbaston, was the premier exhibitor with a circular arrangement of well-grown plants-Liliums, Palms, and ornamental foliaged kinds, brightened with Libonias and Clerodendron fallax, margined with Isolepis. Mr. S. Horton, gardener to W. Fowler, Esq., Sedgley, was second, Francoas being effectively associated with Crotons, Orchids, Bouvardias, and Ferns. The remaining prize was won by Mr. Dyer.

Fruit.—The display of this was not remarkable for extent, while the quality of several dishes left much to be desired, still there were creditable examples of culture in the chief prizewinning collections.

With a collection of ten varieties, including black and white Grapes, Mr. Gilman, gardener to the Earl of Shrewsbury, Ingestrie Hall, took the lead with a good Pine, excellent Black Hamburgh and good Foster's Seedling Grapes, a fine Mclon, with excellent dishes of Pcaches, Nectarines, Figs, and Waterloo Strawberries. Mr. Bannerman, gardener to Lord Bagot, was a rather close second, with excellent produce; and

Mr. John Bailey third. In the class for four bunches of Grapes, distinct, Mr. J. Wilkes, gardener to Mrs. Meakin, won first honours with Madresfield Court, Black Hamburgh, Foster's Seedling, and Muscat of Alexandria, not large, but all ripe and good. Mr. Sidney Brammill, gardener to W. H. F. Mayhurst, Esq., was second with larger but less ripe bunches of Alicante, Foster's Seedling, Gros Maroc, and Muscat of Alexandria; Mr. Bannerman third with Foster's Scedling, Alnwick Seedling, Duke of Buccleuch, and Black Hamburgh, neat bunches, good berries, ripe, but rubbed. With two bunches of white Grapes Mr. C. Froud, Coventry, won first with good Muscats, Mr. Brammill second with fine Foster's Seedlings, and Mr. Bannerman third with small bunches but clean and good berries of Duke of Buccleuch. In the corresponding class for black Grapes Mr. Froud was first with Black Hamburgh, and Mr. Brammill second with Alicante. In the local class for six dishes of fruit the prizes were won by Messrs. Brammill and Bannerman, both staging excellent collections. Mr. F. W. Plant, Bilston, staged most creditable Black Hamburgh Grapes, not for competition, grown on banks formed by the exceptations from coal mines, and perhaps some banks formed by the excavations from coal mines, and perhaps something else. They deserved a mark of high commendation. The best Peaches and Nectarines were staged by Mr. Waite, gardener to Col. the Hon. W. P. Talbot, Glenhurst, Esher, who also took the lion's share of prizes for vegetables offered by Messrs. Suttons, Webbs, and Carters, closely followed by Mr. T. Wilkins, gardener to Lady Guest, Inwood House, Blandford. The collections were excellent.

Cut Flowers.—In the open classes only two stands of twenty-four varieties of hardy herbaceous flowers were staged. First, Messrs. Townsend & Sons, Worcester; second Mr. G. Newell, gardener, Birming-Mr. Alderman Dickinson, Chairman of the Baths and Parks Committee, offered a two-guinea prize for twenty-four varieties of hardy flowers most suitable for park decoration, but there was only one exhibit made by Messrs. Townsend & Sons, and these were chiefly annuals, and some of not a very decorative character. The idea is a good one, but it will be well in the future to make the schedulc more definite. Mr. Paul Lutz, of Wolverhampton, offered as a first prize a handsome gold medal for the best display of Pansies and Violas, and Messrs. Dobbie & Co., Rothesay, won it with a superb display well staged. The Viola sprays, a large number, were especially attractive amongst the newer kinds. In addition, and as a part of Messrs. Dobbie's display, there was a good display of the choicest Sweet Peas, some superb African and striped French Marigolds, Pelargoniums, Carnations, and herbaceous flowers, to all of which a handsome silver medal was awarded. The second prize for collection of Pansies and Violas was awarded to Messrs. Paul & Co.; third to Mr. Campbell, both well-known Scottish florists. Messrs. Perkins & Sons won the prizes for

Miscellaneous Exhibits .- These were extremely numerous, and in many instances of excellent quality. Messrs. Smith & Co., Worcester, had a display of herbaceous and other blooms; Messrs. Birkenhead, had a display of herbaceous and other blooms; Messrs. Birkenhead, Sale, Manchester, their usual fine display of choice Ferns; Mr. J. H. White, nurseryman, Worcester, a bright effective display of cut herbaceous blooms, Carnations, and Begonias; Mr. C. F. Thurstans, Wolverhampton, fine Carnation and Picotee blooms; Messrs. Edwards & Sons, Sherwood, Nottingham, a pretty display of Edwardsian pottery and Ferns; Messrs. Webb & Sons, vegetables; Mr. Bason, Wolverhampton, his famous Mushroom spawn; Messrs. Hewitt & Co., Solihull, Birmingham, a fine display of Begonia, Carnation, and herbaceous blooms; Messrs. Thomson & Co., Sparkhill, Birmingham, some good border Carnations and other flowers; and Messrs. Dobbs & Co., Wolverhampton, and Mr. R. Lowe, Wolverhampton, also had honorary exhibits.

Garden accessories were in evidence outside the tents, and medals

Garden accessories were in evidence outside the tents, and medals were awarded to Messrs. Wright & Holmes, Birmingham, for excellent greenhouses and garden frames and their improved glazing; to Messrs. Bayliss & Inmann, Birmingham, for artistically designed and constructed garden arbours, &c.; to Mr. G. H. Brotherton, Wolverhampton, for garden furniture; to Mr. Jabez Attwood, Stourbridge, for improved hot-water apparatus for amateur greenhouses, and to Messrs. W. Cook and Co., Wolverhampton, for their patent double-action force foot pump, an excellent and easily worked garden hose distributor.

On the third day of the Exhibition special prizes were offered for garden Roses, the object of the Committee being to encourage the cultivation of the older-fashioned garden Roses, and at this Show last year these were brought out in good style, many very old garden favourites being seen. But this year our old kinds had been prematurely driven into and out of flower, and scarcely any were left for exhibition, so H.P.'s and Teas and what older Roses were left in flower had to be fallen back upon. Messrs. Perkins & Sons won first prizes, and Messrs. Townsend & Sons seconds. Mr. Coombs, gardener at Himley, was first for a basket of such Roses.

As a result of the successes of the annual floral fêtes, the public park in which they were held has benefited by sundry erections, and recently an offer of £1000 was made by the Show Committee to the Town Council for the erection of a conservatory in the park, with an undertaking to maintain it. This was not accepted, on the ground that the amount would be more acceptable if applied to the acquirement of an additional park in another locality, where such appears to be needed. The Show Committee, however, prefer to take their stand on the principle that where the money was earned there it should be expended. Undoubtedly the erection of a sensible and commodious structure would be an acquisition, as at Leicester and other places, including some of the London parks; and in every instance, so far as we know, where displays of Chrysanthemums have been provided under glass in the autumn they have given unbounded satisfaction. These park Chrysanthemum shows are visited by thousands, and the public interest in them increases yearly. It is possible the offer in question will be reconsidered, and we may expect the end of it will be that both a new park will be obtained and a new feature of interest added to the fine existing enclosure. This would be a happy issue of which the authors would have every reason to be proud in achieving. As evidence of the success of the Wolver-hampton Shows as rehabilitated largely on the initiative of Mr. W. A. Green, an ardent amateur florist and trusted town official, it may be stated that the takings in 1889 amounted to £907, in 1890 to £986, in 1891 to £1275, in 1892 (wet days) to £1152. On the present occasion the rain led to a reduction of £175 the first day, the receipts being £100 7s. 6d. On the second day they were £322 5s., and on the third £589 9s. 6d., the greatest amount ever taken in one day at these shows. On the last day there were 35,000 visitors.

BOSTON.—JULY 12TH.

THE "port of Lincolnshire" was en fête on the 12th of July, the annual horse, dog, cat, bird, rabbit, Rose and horticultural Show taking place on that date. One large tent sufficed for the gardening portion of the Show, contiguous to which was that devoted to the canines, and it was to a mournful accompaniment of howls in all manner of keys that our representative pursued his work. He thought of giving the dogs a look up afterwards, but a stony stare from a sad-eyed bull dog induced him to alter his mind and he contented himself with admiring Spratts' fine stand of biscuits, &c., outside. The plants were not a very grand display, but cut flowers, fruit, and vegetables were very fair, while the few Roses staged were excellent.

Taking the fruit first, the first prize for black Grapes was awarded to Mr. A. Black, who had large and heavy bunches, but unfortunately they were rubbed, and their appearance thus marred. The variety appeared to be Gros Maroc. Mr. A. Jarnell was second with Black Hamburgh, small, but splendidly coloured; and J. Oldred, Esq., third. Whites were not nearly so good, the first prize bunch (that of Mr. A. Lighton) being uneven, and Mr. Black's second prize one unripe. There were some splendid dishes of Gooseberries, such as are not often seen in the south. Mr. W. Nightscales was first, the Rev. T. Staffurth second, and Mr. Jarnell third. It is getting late for Strawberries, and only two moderate dishes were shown, Mr. Vinters being first, and Mr. M. Crowden second. Currants were excellent, especially the blacks. Mr. King and Mr. Staffurth both had splendid dishes, the former winning. The third prize went to Mr. W. Greenfield. Mr. Staffurth won with whites, and Mr. Nightscales with reds, a second award going to Mr. Greenfield. Raspberries were rather poor, and so were Cherries, Mr. King winning with the former, Mr. Staffurth second. Only a second prize was awarded for Cherries, this going to Mr. Crowden. Mr. Black had the best dish of Peaches, Mr. Dolby following, and the latter won with Nectarines.

The vegetable exhibits were good on the whole. Tomatoes were grandly represented, there being twelve dishes in all, most of them excellent in quality. Mr. King won with a very fine dish of the Perfection type, Mr. Lighton second, and Mr. Vinters third. The best of a fair lot of Peas came from Mr. Nightscales, Messrs. Crowden and Greenfield following. French Beans were of about equal quality, the prizes going to Messrs. Crowden, Nightscales and Staffurth. Broad Beans were very good, Messrs. Nightscales, Staffurth and Jarnell being first, second, and third in the order of their names. A splendid pair of Cauliflowers came from Mr. Dolby, who won from Messrs. Nightscales and Crowden, and Cucumbers were equally well shown by Mr. Greenfield, who defeated Messrs. Crowden and Nightscales. Cabbages as shown by Messrs. Dolby (first), King (second), and W. Mumford (third) were all very good, but neither Lettuce nor Endive was quite up to the mark. Mr. Crowden took

a second prize for both. Mr. Dolby had excellent Carrots and won easily from Messrs. Mumford and Crowden. Capital Turnips came from Mr. Roe, who easily defeated Messrs. Mumford and Jarnell. He also showed Onions extremely well, the second and third prizes for these going to Messrs. Staffurth and Mumford. Mr. Roe had a somewhat thin pot of Parsley, but the quality was better than that of Messrs. Mumford and Staffurth, who followed him in the order of their names. Mr. Staffurth was the only exhibitor of Rhubarb, and was placed first for grand sticks. Mr. Dolby won with Kidney Potatoes and Mr. Nightscales with rounds, the minor awards going to Messrs. Staffurth, Jarnell, and Crowden.

In another section Messrs. Craven and Lockwood divided most of the first prizes for fruit between them, and also showed very prominently in the vegetable classes, other prizes going to Dr. Ashdown, Mr. A. Tapster, and Mr. Vines. The latter had some excellent Potatoes. In classes for collections of vegetables, Messrs. Dolby and Tapster secured first prizes, the minor ones going to Messrs. Jarnell, Craven, and Ashdown.

Cut flowers were somewhat numerous. Mr. J. Illman, Lincoln, had the best bouquet and also the best one of Roses, Mr. Dolby following in each class. The latter won with garden flowers, and was also first in other classes, but Mr. Illman defeated him with buttonbeles and also with twelve stove and greenhouse flowers, the Lincoln exhibitor having some fine clusters. With hardy flowers Mr. W. Clegg was first and Mr. Dolby second. Pansies were rather poor, neither Mr. Clegg nor Miss Porter, who were first and second respectively, having particularly good blooms. The Rose classes showed a must unusual state of affairs, there being only two exhibitors, Messrs. G. & W. H. Burch and Mr. Clegg. The Peterborough growers were placed first for forty-eight, second for twenty-four, and second for twelve trebles, having no opposition in each case. Their forty-eight stand was a very fine one, and the twenty-four deserved first prize considering the season. Mr. Clegg was first in another class for twelve.

Plants were only moderate. Mr. Oldred appeared to be the only exhibitor of Selaginellas, and was placed first for healthy plants. Mr. Dolby was the only exhibitor of Petunias, Fuchsias, and Begonias. The latter were the best, and the first prize was given to them; but he had to put up with second for the others. The best group came from Mr. Oldred. It was well arranged, but somewhat wanting in flowers, the foliage work having been a little overdone. Mr. Dolby was second with a group exhibiting precisely the same fault as the other. Mr. Night-scales was third. Mr. Dolby won with a hanging basket, and the first prize for foliage plants went to Mr. A. O. Scrivener, whose plants were small but healthy. Mr. Dolby was second, and Mr. Nightscales third. Mr. Dolby won with Coleus, having large plants just a little wanting in colour; and for Ferns the prizes went to Messrs. Oldred, Dolby, and Black in the order of their names.

WOODBRIDGE.—JULY 13TH.

A LOCAL reporter, skilled in the art of observation and description, "wrote up to" the annual Exhibition, which is an event of the year, in the "East Anglian Daily Times" as follows:—"The annual show of the Woodbridge Horticultural Society, which claims and deserves the name of a grand musical and floral fête, was held on Thursday last under somewhat unfavourable conditions. It is a traditional coincidence, not out of harmony with the different character of the two enterprises, that Ipswich Flower Show is always spoiled by rain, and the neighbouring event always brightened by sunshine. With the present exceptional season, however, there was a change of luck. Rain fell in torrents just as the charming Abbey Grounds opened upon this year's Exhibition at Woodbridge, and the weather was dull and threatening throughout the day. The scene lost something of its bright and pleasure-inspiring aspect in consequence, but it takes something more than a few showers to subdue the energy of the promoters, or the public spirit of the inhabitants, and in all essential respects the old prestige of the town was habitants, and in all essential respects the old prestige of the town was splendidly sustained. The streets were decorated, general holiday was observed, and there was an exceedingly large attendance of visitors from all parts of the neighbouring district. The entrance to the Show was by a path beneath the spreading Beeches in front of Capt. R. J. Carthew's mansion—whose kindness on these occasions merits warm acknowledgment—and the splendid site provided on the sloping meadows beyond was laid out in much the same style as in previous years. Four large marquees were erected for the staging of the various exhibits; a handsome bandstand was "o'er-canopied" with festoons, and illuminated at night by fairy lights; and the natural surroundings, with the square tower of St. Mary's Church rising above the trees, formed a lovely setting to the animated scene. Judges from a distance were much impressed with the beauty of the grounds. The prize schedule comprised nearly 200 classes, and, generally speaking, the Show was a long way ahead of the Ipswich and East of England Exhibition, and why it should be so was a question much discussed by visitors from the county town. Does the inferiority arise from want of money, lack of good management, or what? The fact remains, whatever may be the cause, and the Woodbridge folk have good reason to feel gratified with the comparison.

The Woodbridge Shows are popular for several reasons. 1, The Society has been long established, and its Jubilee Exhibition is not far distant. 2, It is managed by a body of business men who take great interest in the shows and work together harmoniously. 3, The town, of between 4000 and 5000 inhabitants, is breezy and clean, and not too far from Ipswich (about seven miles by rail) to render the journey a task. 4, The Exhibition grounds are picturesque, and in themselves a force of attraction. 5, The local gentry, tradesmen, and apparently the inhabitants

generally take an interest in the event. 6, The best garden produce obtainable is displayed, and the best music provided—no roundabouts or mountebankism, but a pure "floral and musical" fête, with nothing whatever to offend, but wholesome pleasure is great objective; and (7) the people appreciate all that is done for their delectation, and attend the Shows, "rain or shine." It was nearly all rain on this last occasion, and it seemed proper to endeavour to sympathise with Mr. John Andrews, the indefatigable Honorary Secretary, on the prospective failure; but sympathy was wasted. "Oh! never mind," he coolly replied, "we usually have it fine, and you will see the people will come if it does rain." It rained in torrents, and two of the Judges at least will not forget it (for they had to reach London before getting dried), yet soon after the Show was open the tents were filled with visitors, and a stream of people entered the grounds—as fine an assemblage as one could hope to see. Well done, Woodbridge!

The Rose tent was perhaps the great centre of attraction, for therein was the contest for the 25-guinea cup with stands of twenty-four blooms. Not as a competitor in the class but as an adjudicator, a rosarian was espied, who wears the familiar initials "W. R. R." Good humour was stamped on his countenance, and to the gentle suggestion that he would "take a note of the Roses" came a response "Yes, short." Not that he wanted anything; he simply meant his account would be a short one,

and here it is, quite long enough for the time of year.

The competition in the professional classes was good, one of the brothers Harkness holding his own well against the full strength of Coichester, while at the same time the other brother was winning the Jubilee cup at Worksop against the rest of Great Britain and Ircland. It was a considerable feat, but Roses are grown in such quantities by the leading members of the trade, that it is probable, without detracting from the merits of the performance, that any one of them at his best, with all the others out of form, might have done it.

For the Woodbridge challenge cup, value 25 guineas, Messrs. Harkness was placed first, the best bloom being an exceptionally fine specimen of Duke of Wellington, Horace Vernet, Reynolds Hole, and Earl of Dufferin being also very fine. The stand was sadly marred by three light-coloured blooms put in for the sake of change of colour, La France being especially poor. Mr. Frank Cant was second, not far behind, having Black Prince very fine, and the Duke of Connaught good. Mr. B. R. Cant

hird.

In forty-eights Messrs. Harkness were again first, Horace Vernet and Reynolds Hole being again conspicuous. Mr. B. Cant second, and Mr. Frank Cant third. In twelve Teas Messrs. Prior were first, Mr. B. Cant coming as a very close second indeed, and Mr. F. Cant third. In twelve trebles Messrs. Harkness were again to the front, Horace Vernet being once more the pick of the collection. Mr. B. Cant second, and Mr. F. Cant third. It transpired, however, that the schedule, which was somewhat eccentric, specified twelve trebles of H.P.'s, and as Mr. B. Cant had a fine triplet of Maréchal Niel inadvertently inserted, a substantial extra prize was liberally awarded to them by the Executive, and Messrs. Prior became third.

A silver medal was to be awarded to the best Rose in the professional classes, but as the cup class was strangely debarred there was some trouble about this, and the award eventually went to the best shaped flower, a very light coloured specimen of Comtesse d'Oxford in Mr. B. Cant's forty-eight. Each of Messrs. Harkness' stands was disfigured by sorry specimens of Comtesse de Serenye, introduced apparently for

the sake of light colour.

In the amateur classes the competition was as weak as it was good in the trade division. It was as difficult to avoid winning a prize as it sometimes is, and should be, to get one. A certain gentleman, having no opponent, won a third prize for six H.P.'s of a sort with five indifferent blooms; there was a stem and a few scattered petals on the moss to show where there had presumably been another specimen, but nothing more. In the principal class (18), Rev. A. Foster-Melliar had no opponent, a good bloom of Mrs. John Laing winning him also the medal for the best Rose in the large amateur classes. For twelve Teas, the same gentleman and Mr. Orpen renewed their Crystal Palace contest with the same result, the Sproughton Teas being much larger, though not quite so well shown. Mr. Orpen, however, secured two medals, both with Maréchal Niels: one for the best Rose in the smaller amateur classes, and one, which was a sure win for him to start with, as he had no opponent, for the best Rose grown by an Essex amateur.

The schedule, though not altogether satisfactory, was evidently designed with the utmost goodwill for the encouragement of small growers, there being classes for those growing less than 1000 and less than 500 plants local classes for districts of different radius, and classes for four, two, and even single specimens. It was disheartening to see only one exhibit in a class, and even some classes perfectly empty; but what could be expected in such a season? Thus ends the Roses, and there is very little space left for the rest. This may be filled by the Ipswich chronicler, as we have internal evidence that it was whispered to him by one of the Judges who officiated in the classes referred to.

Second in order of arrangement was the marquee in which fruit and first-class vegetables were displayed. Lord Suffield was as successful here as were the north country exhibitors with Roses and perennials. His lordship's collection of eight varieties of fruit, so well grown by Mr. Allan, the able gardener, would have taken a leading position at any show in England, so fine was the quality of them all. Two new varieties of Strawberries were here particularly noticeable. One of them, named Lord Suffield, is particularly dark coloured, and, unlike some others of that hue, is also of delicious

flavour. The other, Gunton Park, very bright, firm, and good. Both sorts received special certificates because of their novelty and excellence, and will probably take a position as standard Strawberries. Throughout the fruit was excellent. Grapes were generally good, although some small and loose bunches were seen. Mclons looked a great deal better than they were, for there was quite a remarkable absence of flavour. The Judges, after tasting every variety, had great difficulty in finding four good enough for the prizes, and the smallest Melon of the lot was eventually selected as the best. Cherries were splendidly shown in all classes. Lord Suffield's Black, Tartarian and White Hearts were marvellous specimens, and the Morellos could hardly be beaten anywhere. Peaches and Nectarines were not extensively shown, and the first prize dishes were unmistakeably first; there was a great falling off in the rest. Red, White, and Black Currants made an astonishing show, such as is rarely seen. Messrs. Daniels Bros. of Norwich had a capital stand here, not for competition, of Gloxinias, Pelargoniums, Carnations, and new varieties of Potatoes and Peas. The vegetables were staged around the sides, and were also in harmony with

the general standard of excellence.

A third tent was devoted to cottagers' exhibits, and this must be passed by—for want of space, not because the exhibits were unworthy of notice. Last of all, but not least, came the grand section for pot plants and groups arranged for effect. An old moral was here pointed by the Judges. The first prize was given, not to the more imposing groups, but to that (Lord Rendlesham's) which was most freely and artistically arranged, without packing and overcrowding. That every plant should show its own beauty without using one to hide the defects of another, is the principle on which a decision was arrived at. In the centre of Lord Rendlesham's display was a plant of the graceful Humea elegans, and the group was made up of Carnations, Tuberoses, Orchids (for which the Rendlesham Hall gardens are famed), and bright scarlet Anthuriums, together with splendid pots of Dracena, Caladiums, and Crotons. Some of the others had too many Crotons, but the second and third were simply spoiled by overcrowding. The most remarkable feature of the Show here, however, was supplied by the Tuberous Begonias. A new class was formed for groups of Begonias and Maidenhair Ferns in pots (6 feet by 3 feet), and this association of bright colour with delicate foliage had a surpassingly lovely effect. Woodbridge people must be careful to develop an idea which they have had the honour of originating. The Begonias in pots in the classes were highly creditable to the whole of the cultivators. Baskets of pot plants were effective. Exotic and hardy Ferns (first prizes for both going to the Duke of Hamilton) were noticeably good, and the larger specimen plants—Pandanus, Acalypha, Asparagus plumosus, Allamanda, foliage Begonias, and so forth—completed a grand general grouping.

Woodbridge is a very pleasant town with fertile land surrounding it, and this well tilled. The noble church, with the magnificent Seckford Charity, however, constitute the pride of the place. The latter was founded by Thomas Seckford in the reign of Queen Elizabeth, and supported by a small estate in Clerkenwell, then let for a little more than £100 a year. It now comprises several streets, and yields a great revenue. The homes for decayed tradesmen and their widows have a frontage of 337 feet. The inmates have two rooms and a garden, the aged couples enjoying about £30 a year and single inmates £20, with clothing, medical attendance, and everything necessary to their comfort. A pleasure ground and broad terrace walk 560 feet long in front of the buildings is free to all and the public. The site is unique and picturesque. On remarking to the occupant of one of the dwellings, a hale old man, yet bent with years, that he had an outlook as grand as the Prince of Wales has, he replied, with great emphasis, "Yes, sir; and I am as happy as the Prince is too." It is truly a splendid charity, and as well worthy of a note as the flower Show is in the salubrious Suffolk town.

CHERTSEY, WALTON, AND WEYBRIDGE.-JULY 13TH.

The twenty-eighth annual summer Exhibition of this Society was held this year on July 13th in the grounds of Oatlands Lodge, belonging to C. Swinfen Eady, Esq., in every way a charming site for such a purpose. The place is rich in historic points, having been once the residence of the first Duke of York. In the grounds there is a magnificent grotto, said to have cost £40,000 in building. The grounds are beautifully timbered, some very fine Beeches and Lebanon Cedars are to be seen. The Exhibition, although showing a slight falling off in large specimen plants, was a really good general one. The exhibits were numerous, and altogether of commendable quality. The groups arranged for effect had a tent to themselves. Mr. Rawlings, the energetic Secretary, as usual, had all the arrangements complete by the specified time.

Substantial special prizes were offered for the group of plants. There were five competed in the class for a group to be arranged in a half circle 14 feet by 7 feet. Mr. G. J. Cook, gardener to J. S. Sassoon, Esq., J.P., Ashley Park, Walton, was a good first with a remarkably fine arrangement of suitable plants. Well grown and coloured Crotons were effectively disposed above a base of Maidenhair Fern, intermixed with such decorative plants as Francoa ramosa, Cocos Weddelliana, Pancratium fragrans, and Gloxinias. Mr. G. Carpenter, gardener to Major Collis Brown, Broad Oaks, Byfleet, was a good second, a trifle heavier in the arrangement. Mr. H. Jacques, gardener to Miss Kenny, The Almness, Chertsey, third. Four charming groups were arranged in the class for those less in size than the former. Mr. Hopkins, gardener to Mrs. Wodderspoon, Walton-on-Thames, was first. The arrangement of suitable plants was all that could be desired. Mr. Millican, gardener to

H. Cobbett, Esq., Ongar Hill, Addlestone, a good second. Lilium auratum and longiflorum were especially effective here. Mr. Cook staged the best six foliage plants, also the finest exotic Ferns; well grown specimens. Mr. Hopkins took the premier award for a specimen flowering plant, a profusely bloomed Bougainvillea glabra, Mr. Jacques following with Clerodendron Balfourianum. Mr. Millican had choice varieties and well grown specimens in the class for British Ferns, which are usually well shown here. Mr. Cheeseman, gardener to W. Riddall, Esq., Rydens Road, Walton, won in the class for Fuchsias with four specimens freely flowered and not too formally trained. Tuberous Begonias are always a feature at this Exhibition. Those staged on this occasion were no exception, being not only freely grown but grandly flowered, Mr. W. Stedman, gardener to Miss Verity, Moorcroft, Wcybridge, carrying off premier honours. A class was provided for dwarf Lobelias in pots, and a good display they made, being compact and freely flowered. Mr. Pagram, gardener to A. F. Hobhouse, Esq., The Whim, Weybridge, was first. Mr. Stedman staged the best Gloxinias, well grown and freely flowered.

Cut flowers were numerously staged, making a bright display; space, however, forbids more than a passing reference to one or two classes. Mr. Will Taylor, Osborn Nursery, West Hampton, took the premier award in the class for twenty-four distinct bloom Roses, with fresh well-formed flowers, if not large. Mr. T. Osman, Ottershaw Park, Chertsey, staged the best stand of miscellaneous flowers. Mr. Pagram won with herbaceous flowers in a spirited competition. Zonal Pelargoniums, both single and double varieties, were well represented by several exhibitors.

Fruit, though not numerous, was good in quality. For the best collection of six varieties there were four competitors. Mr. J. Swann, gardener to Murray Smith, Esq., Brockley Lodge, Weybridge, won the premier honour with well-finished Black Hamburgh and Foster's Seedling Grapes (extra fine), Princess of Wales Peaches, Hero of Lockinge Melon, and Apricots. Mr. Osman was second. Mr. Swann secured the leading position in the classes for both black and white Grapes, two bunches of each, with really fine examples of Black Hamburgh and Foster's Seedling, Mr. Osman following in the former class, and Mr. C. Gardner, gardener to R. H. Turner, Esq., Rydens Road, Walton, in the last named class. With Princess of Wales Mr. Swann secured leading award in the class for a single dish of Peaches, Mr. Carpenter securing a similar distinction for Nectarines. Mr. Protheroe, gardener to Miss Green, Oakwood, Weybridge, had a really good Melon (Premier) in the class for that fruit.

Messrs. J. Laing & Sons, Forest Hill, staged an interesting group of plants not for competition, in which figured some very fine double Tuberous Begonias. Mr. G. Jackman, Woking, had eight dozen Roses, also not for competition.

PEOPLE'S PALACE.—JULY 13TH, 14TH, 15TH.

A FLOWER and Rose Show was held at the People's Palace, Mile End Road, E., on July 13th and the two following days, primarily for the purpose of encouraging horticulture in the east of London. The Exhibition was opened by Lady Rothschild, who was supported by, amongst others, the Hon. L. Rothschild, Sir Frederick Young, K.C.M.G., Spencer Charrington, Esq., M.P., F. Wootton Isaacson, Esq., M.P., T. Dyer Edwards, Esq., Harry S. Samuel, Esq., Frederick Charrington, L.C.C., Nathaniel L. Cohen, Esq., S. B. Boulton, Esq., and C. A. Murton, Esq. The opening ceremony was of a formal character, and various speeches were made. Mr. Cohen, in the course of some remarks, observed that the governors of the People's Palace were looking forward to the time when it would be possible to form a horticultural society and hold exhibitions of a more pretentious nature in the building. Mcssrs. Harold Boulton, Ernest Flower, and C. E. Osborne are the Hon. Secretaries, and by these gentlemen the arrangements were admirably conducted.

A large and effective group of plants came from the Royal Gardens,

Frogmore, and these being sent by Her Majesty the Queen attracted much attention. They comprised Palms, Liliums, Caladiums, Balsams, Campanulas, Crotons, and Ferns. The Duke of Fife also sent some Crotons, Dracænas, and Pandanus, with bunches of cut flowers, including Iceland Poppics, Sweet Peas, Carnations, and Liliums. Lord Rothschild (gardener, Mr. Reynolds) also had a group of plants, amongst which Ferns, Crotons, Dracænas, and Coleus were conspicuous. The group was edged with Panicum variegatum, which gave the whole a finished appearance. From the same source came a magnificent basket of Water Lilies.

The Countess of Brownlow sent some bunches of hardy cut flowers, principally Alströmerias and Phloxes. Lord Hothfield and the Duke of Wellington also sent some Sweet Peas and Carnations, and R. G. Hargreaves, Ezq., some Pelargoniums, Allamandas, Stocks, and Carnations. Messrs. H. Cannell & Sons, Swanley, had some double Begonia blooms set up in bunches with Maidenhair Fern. The same firm also sent a small collection of Cacti in pots, and J. C. Tasker, Esq., Middleton Hall, Brentwood, had three boxes of cut Roses and some Cannas, the latter being especially good. Colin Romaine, Esq., likewise sent four boxes of Roses, which were admired, and the same may be said of the plants arranged by H. G. Hubbuck, Esq. Some Carnations and Grapes came from Richard Ovey, Esq.

from Richard Ovey, Esq.

Messrs. W. Cutbush & Sons, Highgatc, sent a large collection of miscellaneous plants all charmingly arranged. Amongst these were Palms, Liliums, Vallota purpurea, Dracænas, Oranges, and Crotons. Messrs. W. Paul & Sons, Waltham Cross, also sent a collection of plants and hardy flowers. A group of stove and greenhouse plants came from N. L. Cohen, Esq., and Mrs. J. Butcher, St. Swithen Lane, E.C., had

some beautiful bouquets. Leonard Noble, Esq., sent plants and cut flowers, and S. B. Boulton, Esq., a large collection of stove and greenhouse plants and cut flowers. Ludwig Monde, Esq., had a group of Fuchsias, Palms, Coleuses, and other plants, and J. L. Firbank, Esq., some good Carnations in pots. T. Dixon Galpin, Esq., had plants in pots, and the Duke of Norfolk some cut flowers. E. N. Buxton, Esq., sent a group of stove and greenhouse plants. Mr. J. Douglas, Great Gearies, Ilford, had some Fancy and Show Carnations, as also had Mr. C. Turner, Royal Nurseries, Slough. H. H. Marks, Esq., sent a small group of plants and some baskets of flowers. Mr. E. A. Holmes, Frampton Park Nurseries, Hackney, staged a group of plants, and Mr. J. R. Chard, Stoke Newington, had some table decorations. Messrs. J. Cheal & Sons, Crawley, sent a collection of hardy flowers, and Lady Henry Somerset some cut Roses. A group of plants was also sent from the Royal Botanic Gardens, Regent's Park. Prizes were awarded for miscellaneous exhibits staged by amateurs.

WORKSOP.—JULY 13TH.

It is not at all unlikely that the British public, or such portion of it as attended the floral display at Worksop on Thursday last, got somewhat confused over the Worksop Rose and Horticultural Society's Show of the National Rose Society, held in conjunction with each other as they were; indeed, it was clear from the remarks of many that they did not grasp the distinction between the two. That, however, was not of any great consequence so long as they were satisfied with the dual display, and of that there need be little doubt. A certain reporter, however, experienced a slight shock when on going to deal with one show he found two awaiting his attention. The fulness with which the "National" had to be treated precluded a lengthy account of the local Exhibition, but some features of it were too good to be passed over in silence, notably the fruit from Osberton and Clumber, which spoke volumes for the skill of Messrs. Wood and Slade. The former's Grapes were magnificent. The groups, too, were much in advance of what we have in the south, particularly Mr. Webb's.

Taking the plants first, Mr. Slade, gardener to the Duke of Newcastle, Clumber, won with table material; Mr. Wood, gardener to F. Foljambe, Esq., Osberton, second, both having clean and healthy plants. Mr. Slade was also first for Begonias, Mr. Morris, Worksop, following. The Clumber gardener had some beautiful Gloxinias and defeated Mr. Morris very casily, also showing Lilium auratum extremely well. Mr. Wood won with stove and greenhouse flowers, his Anthuriums being very fine; Mr. Slade was second. Fuchsias were rather poor, and Petunias hardly call for comment, Mr. Stewart of Carlton winning with them. The groups were extremely attractive, the first prize one, arranged by Mr. A. Webb, Kelham, Newark, displaying marked originality of treatment, the sloping bank arrangement so dear to southern exhibitors being departed from in favour of a parallelogram with four small corner mounds and a large central one, the groundwork being formed of moss and Selaginella. There was abundance of healthy flowering and foliage plants tastefully arranged in the groups. Mr. Horton, gardener to the Duke of Portland, Welbeck, was second, also with a charming arrangement, but it was too light, Grasses, Palms, and slender Crotons being too liberally employed. It is praiseworthy to avoid overloading a group with flowers, but Mr. Horton had gone to the other extreme. Mr. Slade was third, his group also having too much foliage, but it was heavier than the other. The plants composing it were healthy and clean. Messrs. Fisher, Son, & Sibray had a beautiful miscellaneous group not for competition.

Cut flowers were largely composed of children's bouquets and similar exhibits, but herbaceous flowers were extremely well shown by Mr. Mallender, gardener to Mrs. Mellish, Hodsock Priory, who had Galega officinalis, Lilium Thunbergianum sanguineum, and L. excelsum very good. W. H. Mason, Esq., Retford, was second, and Mrs. Alderson, Workson, third.

Worksop, third.

Mr. J. H. Wilson had some charming Sweet Peas and Carnations. The latter were extremely good, embracing his yellow ground fancy Mrs. Wilson, and many standard sorts. Messrs. J. R. Pearson & Sons, Chilwell, exhibited their beautiful dark velvety crimson Gloxinia The Beacon, and some attractive floral decorations. One bouquet of Mrs. Reynolds Hole Carnation and bronzy Croton leaves was unique and pleasing to a degree. Messrs. E. D. Shuttleworth & Co. had one of the most effective displays in the Show, consisting of some very fine Roses and hardy flowers, also a collection of healthy foliage plants. The Shireoaks Market Garden Co. had a splendid display of Stocks, the plants being admirably grown, and the strain first rate.

Fruit was exceptionally fine. Mr. Wood had some grand produce in the class for a collection, his Grapes, both black and white, being magnificent, while his Pine, Cherries, and Melon were very good. Mr. Slade was second with fair Grapes, excellent Peaches, good Cherries, and a capital Melon. Mr. Webb was third, his Peaches, Nectarines, and Figs being very good indeed. Mr. Slade won with black Grapes, having finely coloured clusters. Mr. Wood was second, and Mr. Rose, Kirklington Hall, third. Mr. Wood had splendid white Grapes, defeating Messrs. Slade and Preston easily. Mr. Wood won in two other Grape classes, and the character of his bunches showed him to be a grower far above the average. He was first for a Melon, and Mr. Slade second. The latter beat him with Peaches, but was defeated in turn with Nectarines. Mr. Allen, gardener to T. Huntsman, Esq., was first for Strawberries, and Mr. Mallender second, while for Cherries Mr. Slade won, and Mr. Mallender was again second. Hardy fruit was abundant and good. Mr. Joseph Stanley won with Raspberries, and Mr. F. Clark

with both light and dark Gooseberries; minor prizes going to Messrs. J. Hurst, R. Lee, T. Clifton, and A. Ryalls. The awards for Currants went to Messrs. F. Clark, J. Stanley, T. Clifton, J. Darby, and R. Bram-

The cottagers also showed hardy fruit well.

There was an extensive display of vegetables. Mr. Slade was first with a collection, his Cauliflowers, Potatoes, and Onions being excellent. Mr. W. H. Mason was second, and Mr. J. Allen third. The former had very good Peas and Beans. The Shireoaks Market Gardens Co. had a fine dish of Hackwood Park Tomatoes, and were placed first, Mr. Slade being second. The winners also had some very fine Tomatoes not for competition. Mr. J. Doughty was first with Broad Beans and Mr. Stubbings with French, while Mr. Howard was victorious with Cucumbers. Excellent Cabbages and Lettuces were shown by Mr. M. Wood of Rayton, and Mr. Garside was to the fore with Peas. First prizes for Potatoes went to Messrs. Garside and H. Hewitt.

WOOD GREEN .—JULY 15TH.

THE annual Exhibition of the Wood Green and District Horticultural Society was held in the grounds attached to the Town Hall, Wood Green, on Saturday, July 15th. There was a good display of plants and cut flowers from private gardens as well as nurseries. Fruit and vegetables were also fairly well represented in the respective classes, and the same may be said of bouquets and floral decorations. A "Rose Queen" procession and sports were held during the afternoon, and the arrangements were carried out in an efficient manner by Mr. Horace Bates, the

Hon. Secretary.

Some well-known metropolitan nurserymen made a good display of flowers and plants. Mr. T. S. Ware, Tottenham, sent a large collection of hardy flowers, amongst which Gaillardias, Phloxes, Delphiniums, Coreopsis, and Poppies were noticeable. Messrs. G. Paul & Son, The Old Nurseries, Cheshunt, also sent a large number of hardy flowers, comprising two good boxes of Carnations, bright and fresh in appearance. Messrs. R. and G. Cuthbert, Southgate, had a charming group of miscellaneous plants, including Dracænas, Liliums, Ferns, and Begonias. Messrs. H. Low and Co., Bush Hill Park, Enfield, sent some cut Roses; and Mr. W. Bowers, The Vineries, Wood Green, had a group of Tomatoes in pots. The plants were heavily laden with fruit. Messrs. Whellock and Whellock, Wood Green, sent a large number of Roses and Carnations. Messrs. W. Cutbush & Sons, Highgate, exhibited a large group of miscellaneous plants and a stand of Mushroom spawn. Messrs. W. L. Lewis and Co., Southgate, sent a group of Orchids, chiefly Cattleyas and Odontoglossums. These were tastefully arranged with Ferns and other plants.

Groups of plants in the competitive classes were fairly good, the best in a special class coming from Mr. S. Card, gardener to W. Hollingsworth, Esq., Wood Green. Mr. W. Wilson, gardener to — Sydney, Esq., Bowes Park, was second, and Mr. J. Armstrong third. Mr. D. Slater, gardener to F. O. Field, Esq., East Finchley, was awarded an extra prize for a group of plants. Mr. F. Page, Wood Green, was first for a group of Ferns, Mr. F. V. Marment, Bowes Park, being second. Specimen plants were very good, the best being staged by Mr. W. Wilson, Bowes Park, and Mr. S. Card.

Considering the season and late date Roses were finely shown by

Considering the season and late date Roses were finely shown by Mr. G. W. Cook, New Southgate. This gentleman, an amateur grower, won several first prizes. Mr. J. Armstrong, gardener to John Allen, Esq., Southgate, likewise secured a first prize for twelve cut Roses. Mr. E. R. Smith, Muswell Hill, and Mr. E. H. Gould, Bowes Park, were also among the premier prizewinners for Roses. Mr. W. Rumsey, Joyning's Nursery, Waltham Cross, sent half a dozen boxes of beautiful Roses, the flowers being fresh and bright.

ASCOT AND DISTRICT HORTICULTURAL SOCIETY.

By kind permission of the trustees of the Ascot Grand Stand a Cottagers' and Industrial Show was held on the 13th and 14th inst., in connection with the above Society. The following nurserymen exhibited, not for competition: - Messrs, Sutton & Sons of Reading, a fine collection of Gloxinias, with Stocks, Carnations, and hardy annuals. Messrs. J. Laing & Sons, Forest Hill, sent two boxes of Begonias, containing single and double blooms. Messrs. W. Cutbush & Son a good display of Carnations and Pinks, also hardy herbaceous flowers. Mrs. Phippen of Reading, a very attractive group of decorative plants, floral crosses, and a bouquet of Carnations, which was much admired. Messrs. J. Standish and Co. filled the end of the Rotunda with Palms, Acers, &c. Mrs. S. F. Ponton of Wokingham had Cucumbers and Tomatoes. Attractive groups of plants were sent by local gentlemen. The one arranged by Mr. Thorne, gardener to Major Joicey, of Sunningdale Park, was highly admired, as was a fine bank of Begonias from Sir William Farmer (gardener, Mr. Hataway). E. Hamilton, Esq., The Charters (gardener, Mr. Cole) and Mr. Lane, King's Ride, furnished the centre of the tables with good Crotons, Caladiums, and other plants. The cottagers' exhibits were of very good quality, but not so numerous as in other years. Prizes were also given for well kept gardens. The Committee have plenty of funds and a charming place to hold a show. In a neighbourhood containing good gardens it is a pity they do not offer prizes for amateurs at summer shows.—A VISITOR.

TRADE CATALOGUES RECEIVED.

George Bunyard & Co., The Old Nurseries, Maidstone.—Roses, Bulbs, and Strawberries.

J. Laing & Sons, Forest Hill, S.E .- General Plant Catalogue. Ant. Roozen & Son, Overveen, Haarlem, Holland.—Dutch and Cape

Bulbs.

CARNATION AND PICOTEE UNION.

THE annual Exhibition held in connection with the Carnation and Picotee Union took place on Tuesday last in the gardens of Mr. E. S. Dodwell, Stanley Road, Oxford. As might have been expected the northern growers were to the fore, their blooms being just at the summit of their beauty, while those of the more southern men have been over for two and in many cases three weeks. Taken as a whole the Exhibition was an unqualified success, the flowers being of perfect form and substance, if slightly lacking the size it is now customary to see amongst them. High praise must be accorded to Mr. Dodwell and the Committee for the admirable manner in which the Show was conducted. The occasion of this Exhibition bringing together so many friends was considered a fitting one for presenting to Mr. and Mrs. Dodwell on the happy attainment of their golden wedding, a silver tea and coffee service and salver, which had been subscribed for by over 200 of the veteran florist's friends. With the above was also given a testimonial which had been signed for by the numerous subscribers.

The following is a copy of the testimonial presented to Mr. and Mrs. Dodwell:—" Very many friends throughout the kingdom as well as abroad desire upon the occurrence of the fiftieth anniversary of your wedding day to offer you their warm congratulations on this memorable and happy occasion, and to add their earnest hope that, surrounded by those you love and who so dearly love you, much length of days may yet be granted to you. They gladly avail themselves of this opportunity to give expression to the feelings of respect and admiration with which they have long watched Mr. Dodwell's floricuitural work, and to record their sense of his unvarying kindness and courtesy among his fellow florists. They wish, then, as a mark of their regard, and of the gratification they feel that you have been permitted to reach this crowning point of your wedded life, to beg your acceptance of the accompanying tea and coffee service and salver—the produce of many subscriptions purposely limited in amount—assuring you that it is a souvenir of widely felt loving regard, and equally assured that you will find in that feeling the chief value of this gift."

The Rev. Mr. Collier made an excellent speech in making the presentation. Mr. Dodwell expressed thanks and gratitude on behalf of himself and Mrs. Dodwell to their friends for this unanimous proof of their real regard. Many speeches were made by friends at the luncheon, after which the presentation took place. The following ladies and gentlemen were present, amongst others, to assist Mr. Alderman Buckell in the chair-The Rev. C. P. Brickwell, Rev. Mr. Scott, Rev. Mr. Collier, Rev. Mr. Gibbs, Mr. and Mrs. E. S. Dodwell, Mr. Alfred, Mr. Arthur, and Mr. Fred Dodwell, and other members of the family. Dr. Guinness and Messrs. Ranger Johnson, T. E. Henwood, Chas. Phillips, Arthur Brown, Robt. Sydenham, Wm. Bacon, Wm. Harding, J. S. Hedderley, J. Whitham, Tom Lord, J. Wynne Ffoulkes, C. H. Herbert, Thos. Anstiss, and Mr. and Mrs. J. Hill. The company numbered over one hundred in all. Let us hope that on the occasion of Mr. and Mrs. Dodwell's diamond wedding such a meeting of friends may again take place. Mr. Dodwell has worked hard in the interests of horticulture generally, and has thus gained many personal friends and the high approbation of many gentlemen who have never yet met him. We append the names of the principal prizewinners, also those of the varieties exhibited in the leading stands.

In the class for twelve flake or bizarre Carnations, in distinct varieties, Mr. Tom Lord, Todmorden, was an excellent first, staging blooms of Bruce Findlay, Master Fred, Duke of York, Gordon Lewis, Thaddeus, Admiral Curzon, two seedlings, George, Sportsman, J. D. Hextall, and Robert Houlgrave in magnificent condition. Mr. J. Whitham was a very close second; Mr. Robert Sydenham a creditable third; Messrs. Thomson & Co. fourth; Mr. Geo. Chaundy fifth; Mr. A. K. Brown sixth; and Mr. W. Read, gardener to Mr. E. S. Dodwell, who in ordinary seasons is usually found much nearer the top of the tree, seventh. Mr. J. Edwards took the premier position in the class for six flakes and bizarres, dissimilar, exhibiting fine blooms of Master Fred, two seedlings, Teddy, Sportsman, and Guardsman. Mr. E. Shaw was a good second; Mr. J. S. Hedderley third; Mr. C. Phillips fourth; Mr. A. Medhurst fifth; Mr. Wm. Bacon sixth; and Thos. Anstiss seventh.

For twelve white ground Picotees, in distinct varieties, Messrs. Thomson & Co. were first, showing in finc form Mrs. Sharp, Amelia, Nellie, Dr. Epps, Mrs. Chancellor, Thomas William, Little Phil, Zerlina, Campanini, Mrs. Payne, Lady Louisa, and Mrs. Gorton. The flowers in this stand were, with scarcely an exception, fresh and bright. The second prize was awarded to Mr. Robt. Sydenham for a fine stand, Mr. J. Whitham being third, Mr. Tom Lord fourth, Mr. A. R. Brown fifth, Mr. J. Edwards sixth, Mr. E. Shaw seventh, and Mr. Chas. Phillips cighth. Mr. A. W. Jones staged some beautiful blooms in the class for six white ground Picotce Carnations. The stand included Mrs. Payne, Nellie, Favourite, Thos. William, Brunette, and Campernini. Mr. J. B. Sharp was second, Mr. J. S. Hedderley third, Mr. Wm. Bacon fourth, Mr. Medhurst fifth, and Mr. Anstiss sixth. The competition was keen in this class, the flowers being remarkable for their perfect colouration and form.

For twelve Carnations, either selfs, fancies, or yellow grounds, in distinct varieties, Mr. Robert Sydenham was deservedly awarded the first prize. The exhibit included Romulus, Tournament, A. W. Jones, Gladys, Stadtrath Bail, Dodwell's 167, Germania, Janira, Victory, Mrs. Robert Sydenham, Mrs. Jameson, and Brockhaus. The second place was taken by Messrs. Thomson & Co. with a fine exhibit, Mr. George Chaundy being third, Mr. A. R. Brown fourth, Mr. W. Read, gardener to Mr. Dodwell, fifth; Mr. J. Walker, Thame, sixth; Mr. Thos. Anstiss

seventh, and Mr. C. Phillips eighth.

For six Carnations, either selfs, fancies, or yellow grounds, dissimilar, Mr. W. Spencer was accorded the premier position, staging beautiful flowers of Mrs. Robert Sydenham, Schlieben, Theodore, Madame Van Houtte, Stadtrath Bail, and Vandyck. Mr. Chas. Harden was a very good second; Mr. J. S. Hedderley, third; Mr. E. Shaw, fourth; Mr. N. Medhurst, fifth; Mr. Chas. Henwood, sixth; Mr. J. Edwards, seventh; and Mr. Wm. Bacon, ninth. Mr. W. Read was placed first in the class for six blooms of the Kilmory yellow ground seedlings in not less than three dissimilar varieties. This stand included perfect examples of Tournament, Queen of Hearts, Nora, Tournament, Sport, Nosula, and Nancy. Mr. A. Medhurst was second; Mr. Geo. Chaundy, third; Mr. Thos. Anstiss, fourth; and Mr. Wm. Bacon, fifth.

Mr. A. W. Jones was accorded the first place in the class for six yellow ground blooms, any raiser's variety, with Stadtrath Bail, Almira, Counters of Jersey, Germania, Mrs. Robt. Sydenham, and Atalanta. The second prize was awarded to Messrs. Thomson & Co., Mr. Wm. Reid being third, Mr. Chas. Phillips fourth, Mr. Chas. Harden fifth, Mr. T. E. Henwood sixth, Mr. A. R. Brown seventh, Mr. J. S. Hedderley eighth,

Mr. J. P. Sharp ninth.

The premier blooms in the Exhibition were Master Fred, a scarlet bizarre exhibited by Mr. Tom Lord; Germania, yellow self from Mr. A. W. Jones; Dodwell's 1528 fancy Carnation, shown by Mr. Wm. Read; white ground Picotee Little Phil, staged by Mr. J. Whitham, and yellow ground Picotee Mrs. Robt. Sydenham, exhibited by Mr.

Spencer.

Certificates were awarded for the following blooms:—Arline, pink and purple bizarre, magnificent flowers; Thaddeus, crimson bizarre of great merit; Bruce Findlay, a pink and purple bizarre of superb form; Duke of York, a beautiful scarlet bizarre, all of which were staged by Mr. Tom Lord; Feron, a fine purple flake, exhibited by Mr. J. Whitham; and Mrs. Anstiss, a rich apricot-coloured self of great substance and good form, shown by Mr. Anstiss. It being very late when our reporter reached Oxford, it was found impossible to get a full list of the prizes, as some of the blooms had been removed.

FRUIT FORCING.

Vines. — Earliest House. — Thoroughly ripened wood and well nourished properly developed buds are of primary importance in securing a crop of Grapes the following season. The wood is generally well ripened in the early houses, for the Vines as a rule are not overvigorous, and the dry atmosphere maintained during the ripening of the Grapes tends to mature the foliage, buds, and wood. This is sometimes fatal to the principal leaves, or those corresponding to the pruning buds by encouraging red spider, and the consequence is the Vines go to rest early and start into growth in September, when they should be completely at rest. When the Vines lose the lower leaves on the bearing shoots growth should be encouraged from the laterals, alike to stimulate root action, appropriate the sap, and prevent premature resting. Where the Vines retain the foliage to the base of the bearing shoots—termed laterals—it will be necessary to maintain a dry atmosphere to thoroughly ripen the wood, but it will not be needful to employ artificial heat. Ventilate fully, keeping all laterals and late growths stopped, and aim at complete rest by having the border cool and moderately dry. inside borders may require watering, but avoid making the soil very Outside borders may need covering with dry straw or bracken in order to throw off heavy rains, for a too moist condition of the soil tends to late growth. Where the Vines are in an unsatisfactory condition prepare for lifting at an early date, getting fresh loam and clean drainage handy, so that the work can be quickly performed when started. It is desirable to lift the roots and lay them in fresh soil near the surface whilst there is foliage on the Vines, but the leaves corresponding to the pruning buds must be maturing, and the lateral growths will favour speedy root action. Work of this character ought not to be delayed beyond August in the case of Vines that are to be started early in December, which will need pruning by the middle of September or a little later.

Vines for Early Forcing.—When it is contemplated to start Vines early that have hitherto not been so subjected, it will be necessary as soon as the crop is off to thoroughly cleanse them by syringing or the application of an insecticide. If there is any doubt about the maturity of the wood and the plumpness of the buds it will be desirable to employ fire heat in the daytime to maintain a temperature of 70° to 75° with moderate ventilation, and turn the heat off at night to allow the pipes to cool. This, with a thorough circulation of air, will soon cause the wood to harden and the buds to plump, inducing rest. When the Vines have the wood ripe and the buds plump they will only require full ventilation day and night.

Vines in Pots for Very Early Forcing.—When these are to be started early in November to afford ripe Grapes during March or

April the wood should now be thoroughly ripened and the buds plumped. If not the house may be kept rather warmer by day, say 70° to 75° artificially and 80° to 85° with sun heat, closing early so as to raise the temperature to 90° or 95°, and throw the ventilators open at night. Afford water or liquid manure in sufficient quantity to prevent flagging, and expose the foliage to all the light possible. Laterals must be kept well in check, leaving no more than are absolutely essential to appropriate any excess of sap and so prevent the principal buds being started. When the wood is brown and hard and the buds are prominent the Vines should be removed to a situation outdoors, standing the pots on slates or boards in front of a south wall or fence. Secure the canes to avoid damage from wind, and only give water to prevent the foliage falling prematurely. In wet weather the pots may be laid on their sides or some waterproof material be employed over them. When the main leaves turn yellow commence reducing the laterals, and prune when the leaves are all off, the laterals being cut off close and the canes shortened to the length required. This done place them in any cool, airy, dry place Keep moderately dry at the roots, and until required for forcing. exclude frost.

Successional Vines Freed of their Crops. — If there be any red spider thoroughly cleanse the Vines by means of water from a syringe or engine, and repeat occasionally. Mealy bug and scale should be combatted with petroleum. It is easiest applied in emulsion form, but this coats the glass with soapy matter, which is not easy to get off once it hardens. There is no objection to pure petroleum and water, the thing is to keep it well mixed whilst it is being applied. This may be done by one person syringing into the watering-can, whilst another applies it to the Vines forcibly so as to well coat every part of them and house with the mixture—a wineglassful of petroleum to 4 gallons of This repeated two or three times at intervals of a few days is an effectual remedy. Keep the laterals within reasonable limits. If the Vines are vigorous, and the wood not ripening well, keep the house rather dry, and ventilate fully at night, but turn on the heat by day, and ventilate moderately. This will tend to the maturity of the wood and buds. Vigorous Vines must not be stopped too closely or the principal buds may be started into growth by an excess of sap, and they may be kept without water until the foliage becomes a little limp. Vines, on the other hand, that are enfeebled by continued cropping should be encouraged to make growth by applying liquid manure to the border. Ventilate the house freely day and night, for it is mainly a question of evaporation in securing thoroughly ripened wood.

Grapes Ripening.—Whilst colouring most Grapes swell considerably, and there must not be any deficiency of moisture in the border. Give, therefore, a good supply of water or liquid manure, especially the latter, where the Vines are heavily cropped, for though it may not materially influence the Grapes it will contribute to the general health of the Vines, and by giving them plenty of time the crop may finish satisfactorily. Hastening heavily burdened Vines and a deficiency of nourishment is almost sure to culminate in defective colour in the Grapes. A good rest at night in a temperature of 60° to 65° with air is a great help to Vines taxed to the utmost by a heavy crop. Allow the laterals to extend if possible. A moderate amount of air moisture is essential to the health of the Vines, sprinkling the floor in the morning and afternoon in bright weather, or occasionally, and no ill effects will follow, provided a circulation of rather warm air is secured This is absolutely essential to avoid spot in Muscat of Alexandria and some other tender skinned Grapes, therefore admit air constantly enough with a gentle warmth in the hot-water pipes to insure a circulation and prevent the deposition of moiscure on the berries.

Melons.—Stopping and Removing Growths.—When the fruit is swelled to the size of an egg, the laterals shou!d be kept pinched to one leaf, and if this results in too much foliage, so that the main leaves are crowded or shaded, thinning must be resorted to. This should be done a little at a time, for removing a large quantity of foliage at once gives a check to the fruit swelling. Instead of distant manipulation, the plants should be gone over once a week at least, and in the case of vigorous plants twice, for stopping and the removal of superfluous shoots, never allowing the principal leaves to be crowded, but fully exposed to light and air.

Watering.—Never allow the plants to lack moisture at the roots, for when water is withheld until the foliage flags a check has been given, and the effect is seen in their feeble aftergrowth, from which they seldom recover and often collapse, or the crop ripens prematurely and is poor in flavour. The great point is not to allow flagging, and yet not to give water until the soil is becoming so dry as to be insufficiently moist for the support of the plants, when a thorough supply should be given. Plants swelling their fruits will need water or liquid manure at least once a week. When setting and ripening it will suffice to just keep the foliage from flagging, and if watering becomes necessary it should be given to those in frames without wetting the foliage more than can be helped. A poor growth is not good either for setting or the ripening of the fruit, but a drier condition of the soil is desirable at those times than when the fruit is swelling.

Syringing the Plants.—When the flowers are advanced for expansion withhold water from the foliage, also when the fruit is ripening, as this is the chief cause of the fruit cracking. At the time of setting and ripening in frames and pits the atmosphere can hardly be kept too dry; in houses moisture must not be entirely withheld at those periods, but surfaces should be damped in the morning and afternoon in bright weather. When the fruit is swelling syringe well at closing time, and if morning syringing is practised it should be done early.

Plants in frames should be sprinkled at closing time during the swelling of the fruit, but on fine days only, being careful to keep the water

from the neck or collar of the plants.

Ventilating.—During the setting and ripening of the fruit admit air freely, leaving a little on constantly to prevent the deposition of moisture on the blossoms or fruits through the night. Give more ventilation early in the morning of bright days, always when the temperature has advanced to 75°, and gradually increase it with the advancing heat, keeping through the day at 80° to 90°, and closing sufficiently early to rise to 90°, 95° or 100°, and before nightfall admit a chink of air at the top of the house or the back of the frame. This is particularly necessary in closely fitting and glazed structures, in badly constructed houses night ventilation may be dispensed with.

Temperature.—Resource will only need to be had to fire heat in houses and to linings for frames in dull cold periods, then a little artificial heat is desirable to maintain a buoyant atmosphere when the blossoms are setting and the fruit is ripening, otherwise the temperature will be ruled at this season by external influences. A night temperature of 65° and 70° to 75° by day must be given to plants in houses.

THE FLOWER GARDEN.

Carnations.—If not already done a mulching of old Mushroom-bed manure or leaf soil should be given Carnations after very lightly loosening the surface, and giving a good watering. This will serve to prolong the display considerably. The Margaret Carnations, if raised moderately early and duly planted out, will flower strongly in August or September, though not if they are topped; give these also the benefit of a mulch.

Propagating Carnations.—If the smaller side shoots are slipped off now these will strike quite as readily as Pinks in a frame or handlights placed at the foot of a north wall or fence. In warm moist localities bottom heat may be dispensed with, but a very slight hotbed is of good assistance. Pack enough material inside the frames to raise about 4 inches of loamy gritty soil well up to the light, and face over with sharp sand. Little or no trimming is required by short slips, but longer cuttings or any upwards of 4 inches in length should be shortened, not however, by cutting with a knife, the better plan being to pull them cleanly apart at a joint. Fix them firmly in the soil, give a gentle watering, and keep close and shaded from what bright sunshine reaches the frame till rooted.

Saving Pink Seed.—Seed if ripe may be either stored till next spring, or else be sown at once. When quite new yet properly ripened it germinates quickly either on a well prepared border or in boxes set in a cool shady position. If not sown very thickly neat little plants will be formed before the winter arrives, those in boxes being kept in cool frames. Mrs. Sinkins, and varieties raised from that robust popular form, come quite true from seed, and young plants partaking somewhat of a perpetual flowering character are more likely to flower the same season they are planted out than are the more delicate varieties.

Mollyhocks.—Red spider can be destroyed by mixing a handful of flowers of sulphur into a paste and then mix it with two gallons of clear water, and with a syringe thoroughly wet both the under and upper surface of the leaves. Black fly is also unusually prevalent on Hollyhocks, and this may be got rid of by means of tobacco powder or strong snuff, puffing this well over the under side of the leaves. No side shoots should be allowed to grow on any of the plants. They ought to be kept well supplied with moisture at the roots, and be given a mulching of short manure. If leaf buds are found at the axils of the leaves of any side shoots removed, the latter may be cut into short lengths, placed singly in small pots, and rooted in a gentle but not very moist heat. All that develop into plants should be shifted into larger pots before they become much root-bound.

Dahlias.—Old stools push up very many more shoots than should be left to grow, much better results following upon the practice of confining the plants to a single stem, or at the most two stems. These being kept properly secured to a strong stake, will branch strongly and produce either a few extra fine blooms for exhibition purposes, or an abundance of ordinary good flowers. If the former are desired about four stakes should be placed to each plant, and some of the best placed branches be fastened to these, the rest being cut away or better still early pinched out. Dahlias require abundance of moisture at the roots, a good mulch of strawy litter further serving to keep the ground cool and moist.

Gladioli. — Stakes should be placed to these before the spikes become heavy, frequent syringings and waterings also being necessary if fine spikes and large flowers are desired. In order to have the spikes for exhibition with the flowers well together and all facing one way they ought to be enclosed in a V-shaped trough, made by nailing two long thin pieces of board about 4 inches wide to a strong stake. With the aid of these troughs it will also be an easy matter to shade the lower flowers with newspaper, with a view to keep them fresh and of good colour to match the upper flowers.

PLANT HOUSES.

Epacris.—Give these full sunshine and abundance of air, so that their wood will become thoroughly ripened, which is necessary to insure abundance of flowers. Also give a sufficient supply of water at their roots, or the lower foliage will soon turn yellow and fall. On the other hand do not allow the soil to become saturated by heavy rains. Old lights that can be placed over them when necessary is all the protection they need. Erica hyemalis may have the same treatment.

Ralosanthes.—Plants that have flowered should be cut close back and be placed in a frame until they break into growth, after which keep perfectly cool and wintered on a shelf in the greenhouse. Young shoots may be inserted singly or four or five together in 5-inch pots, and if put in gentle warmth the cuttings root quickly. If they are to flower the following season they ought to be hardened when rooted, and either placed outside or on a shelf in the greenhouse. The growths should be well ripened, the object is to prevent them starting again into growth. If they make fresh growth while being rooted flowers need not be looked for until the plants have enjoyed one clear season's growth. Where an increase of stock is needed the stems may be cut into lengths, for these root quickly and break freely into growth.

French and Fancy Pelargoniums.—Cuttings that are rooted for early flowering should be placed into small pots at once and stood in frames until they start into growth. The points of the plants ought to be removed if not done when the cuttings were inserted. Cuttings for the main stock of young plants for another year should be inserted at once. They will root with freedom if put in sandy soil outside. We find this the easiest and most certain method of propagating these plants. Do not insert mere flower stems, older portions of the plant root freely and make much better plants. Plants that have been ripening on the walks for a few weeks may be cut close back and placed in a frame until they break into growth. Keep the frame moderately close and syringe the plants twice daily until they commence to grow, when the old soil may be shaken from their roots, and repot. Keep close for a time until root action has commenced, when the plants should be grown perfectly eool.

Zonal Pelargoniums.—Plants that are growing outside and are intended for autumn and winter flowering should have the flower trusses removed as they appear and any shoots stopped that are taking the lead. If the pots are well filled with roots give weak stimulants every time they need water, or artificial manure may be given to the surface of the soil at intervals of a fortnight. The plants should be fully exposed to the sun, and firm sturdy growth must be encouraged. Plants that have been flowering inside and have grown leggy may be cut back. If started in frames and grown under glass these will make excellent flowering plants during the winter. The cuttings from these plants may be inserted in boxes, or in borders outside, and when rooted placed into small pots. These will flower in 5-inch pots during the early spring months. Cuttings that are rooted may be placed into 3-inch pots, and if stood outside when established will flower profusely under glass during the declining months of the year. The points of these plants may be removed, and then they should be allowed to grow on without further pinching.

Solanums.—Plants that have set a good crop of berries should be watered freely. If once they are allowed to become dry the foliage will turn yellow and the beauty of the plants will be destroyed. Soot water assists them wonderfully and imparts to the foliage a fine dark hue. These plants may be plunged outside in ashes. The syringe should be used freely to been the foliage free from red spider.

used freely to keep the foliage free from red spider.

APIARIAN NOTES.

AT THE MOORS.

As much information regarding the management of bees is gleaned at the moors, I will, according to my custom in previous years, record what comes under my observation. Owing to the continued heat and dry weather there is the most profuse bloom on the Heather that I have ever witnessed.

On July 1st I took one prime swarm, an old Punic stock not rid of its surplus queens, and a number of nuclei. Owing to some oversight or an accident on the way, there was a small opening in one of the boxes sufficient for bees to escape, but wherever we were they returned to the box, even when moving along. When discovered of course I stopped the hole, shutting out two bees. The day was fine and warm, and on my return, three hours afterwards, the escaped bees met me at the place they were shut out, accompanying me to the station, a distance of one and a half mile. Had I travelled the other way the bees would I have no doubt found their hive. The moment the old stock was opened, although it had previously swarmed and been divided into eight, it threw off another swarm, and I have reasons for believing it was not The prime swarm was a strong one, and only a the last one. week old. Although subjected to rough treatment in the conveyance, no combs were broken. Some of the Punic surplus queens entered this hive, and in eight days after it was set down it swarmed at a distance of two miles, and was hived in a tool-box upon the railway. In the course of a week the nuclei filled their boxes with combs, and the prime swarm increased in weight 20 lbs., while all the queens were fertilised, and every available cell filled with eggs and larvæ a few days after.

On July 11th we started in the morning with sixty hives,

and owing to the rough roads I expected the whole of them would be spoiled, but not a bee was lost, nor a comb broken, after a journey of fifty miles by road and rail. Six men managed the whole, and in two hours after their arrival at the station, which is two miles from their destination, the work was completed. Taking the number and other things connected with them into consideration it will be easily seen there is no other hive extant that could be set down with similar safety and expedition. If there were any reliance in the advice to give timeous room to prevent swarming, and the returning of after swarms for the same purpose, it would be a boon to bee-keepers. Three hives, with a plurality of queens piping for four weeks, swarmed a day after they were set down. Notes from the moors will be continued next week.—A Lanarkshire Bee-keeper.

• All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Verses (Castanea).—We are unable to inform you in what book the verses you send are to be found, and we have not space for their insertion in our columns.

Biennials and Perennials from Seed (Reader).—You may sow at once in light soil in the open ground, any or all kinds of which seed is offered in catalogues, but there should not be a day's unnecessary delay. Your letter only arriving as our pages were being made up for press we cannot possibly do more than give this brief reply to your question.

Showing Annuals (Constant Reader).—When prizes are offered for three annuals schedules usually say they must be distinct kinds. In that case there must be no more than three, and the Sweet Scabious may be one of them in one colour. Neither a Dahlia nor a Gladiolus would be admissible in such a class for they are not annuals. Annuals are plants which are raised from seed, flower, and die, root and branch, the same season.

Criticism (S. J. A.).—By all means exercise your critical intelligence to any extent so long as it affords you pleasure. We do not intend to discuss the unending theme of market prices, nor to alter them to meet diverse individual views. The measures we have recommended will prevent, do prevent, and have prevented, the Tomato disease. We have grown Tomatoes for thirty years, and never once failed in having good crops from clean plants, and we do not expect to fail in the future.

sowing Begonia Seed (Begonia).—Probably the best plan would be to sow the seeds very thinly in boxes or large pans, so that the seedlings would have room to grow undisturbed as long as they could be kept growing, and winter the tubers in the soil in which they grew until they showed signs of growth in the spring. Under proper management they would make good flowering plants next year. Certainly transfer the pollen of the fringed single variety as you propose. You may not, however, succeed in your object the first year of the seedlings flowering.

Crinum capense (G. A.).—This plant is hardy in sheltered positions, and we have never seen such large floriferous clamps as in the deep rich soil of a south border, the plants mulched and watered in the summer, and the ground thickly covered with leaves in winter to prevent injury by frost. The bulbs are usually safe when planted 6 or 8 inches deep and have a little surface protection. The plants do not always succeed in dry conservatories, in which they are often some distance from the glass, and considerably shaded. With healthy root action in sweet loamy soil, and abundance of light and air, the leaves are not yellow, but green. The plants enjoy root moisture in summer, but not stagnant soil, and a sunny position. In the autumn the water supply may be reduced and the plants exposed to all the sun possible for ripening the growth and storing nutrient matter in the bulbs. They succeed admirably in cool frames during the period of growth, or in light greenhouses, with plenty of air. The soil should be kept dryish,

not dust dry, in the winter. The root action of your plant may be defective, and the position it occupies not quite suitable.

Petræa volubilis (Young Gardener). — The history of Petræa volubilis is brief but interesting in some degree. It was first discovered by Houston at Vera Cruz, but has also been found at Martinique and elsewhere. On the authority of Alton's "Hortus Kewensis" it seems that seeds were first sent to the Chelsea Botanic Garden before 1733, but from these Miller states only two plants were raised, flowers not being produced until 1802, when a specimen bloomed in Mr. Woodford's collection at Vauxhall. From this a coloured plate was prepared for the "Botanical Magazine" (plate 628), but the variety there shown is distinct from that you mention, the corolla lobes being larger, the calyx lobes more narrow, and the colour a uniform purplish-lilac. Houston named the plant in honour of Lord Robert James Petre, who, it has been said, was "the worthiest of men, whose death was the greatest loss that botany or gardening ever felt in this island." A very large collection of plants was formed by this nobleman, large stoves and conservatories being erected for the tropical species, while the outdoor collection was also extremely large, the total number of individuals being said to be about 219,925. The culture of the plant is easy. Given an ordinary stove temperature, a good compost of turfy loam and peat, with a small proportion of well decayed manure, and little difficulty will be experienced in both growing and flowering the plant, providing it be kept clear of insects, mealy bug being its especial enemy. Supply water liberally when growth is advancing, syringing freely to keep the foliage fresh and clean. It can be increased by layers, but the best way is to graft young shoots upon pieces of the root in April or May, when if treated like other root cuttings, placed in heat and shaded, young vigorous plants can usually be readily obtained.

Gros Colman Grapes (Youngster).—The Grapes are a credit to you; but since you say you have "never seen larger and would like to do so," we show you a good sample as grown by Mr. J. Goodacre, of

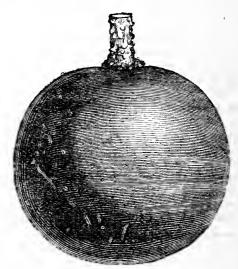

FIG. 11.—GROS COLMAN GRAPE.

Elvaston. The berry depicted in the engraving, fig. 11 was taken from a bunch that weighed 7 lbs., but contained only sixty-eight berries. Keep on striving, and you will excel as a Grape grower.

Ivy on Trees (A. D. W.).—There is no question but that Ivy is injurious to trees against which it grows, as is evidenced by the diminished vigour of the trees as compared with those that are not mantled with Ivy; but there is no disputing the fact that when trees have been long and so much covered with it as to be very much enfeebled thereby, that the removal of the Ivy acts prejudicially by exposing the long-protected bark to the direct influence of the atmosphere. Ivy ought never to be allowed to grow on trees that are intended for profit, but should be cut or removed before it has made much headway. Trees covered with Ivy in a young state will never make profitable timber, and aged trees are better felled when covered with it, unless it be desired to retain them as ornaments.

Muscat of Alexandria Vine Leaves Vellow (B. A.).—The leaf has the peculiar appearance incidental to scorching in this variety. It is probably caused by excessive evaporation from foliage subjected to a close and moist atmosphere during the night and early part of the day. Admit a little air at night if the house is closely glazed, and in all cases increase or give ventilation in the morning by the time the sun acts upon the house, so as to dissipate the moisture and allow the evaporation from the leaves to go on correspondingly with the increasing temperature. As for the wireworms, they are best trapped. Pieces of turf about 4 inches square inserted in the border about 1 foot apart are good traps, the turf being fresh—that is, with live grass and roots, placing them a little below the surface, so that they may remain moist and right side upwards. The wireworms feed on the roots, and by withdrawing the turf occasionally the pests may be caught. Carrots cut into 2-inch lengths and buried about an inch below the surface are also good. A pointed stick may be thrust into each bait, so as to form a handle, and by it the bait can be readily withdrawn at short intervals and examined. The wireworms will be found feeding on the Carrot, and may soon be cleared away. Lime water will not do any harm to the Vines nor to the wireworms. The best plan is to catch and kill them.

S we in the old country are interested in the work and ways A horticultural of our kinsmen on the "other side," so do our transatlantic friends and fellow workers seek to become acquainted with the plans, methods, and intentions of cultivators in the mother land. Those who had the privilege of attending the luncheon at the Trentham Show last week will not soon forget the splendid welcome given by some 200 Englishmen to the American Consul; neither will they forget his earnest, eloquent, responsive speech. The Consul, though a new comer, had been quick to perceive the love for gardens existing among the inhabitants of this country. He recognised the great advantages of this to a community, and expressed his full sympathy with all that had been done and was being done to foster the taste in flowers and improve the cultivation of the land around the dwellings of the people. The example of the mother nation, to whom his people looked with pride, in making home plots bright as well as useful would not be lost on the daughter land. He had communicated his impressions and views to his authorities, and told them that wherever a patch of ground could be found near a cottage door a Pansy smiled. Flowers grew because they were loved, and it was gladdening to see the produce of the gardens of England. Such in brief and substance was the speech of Mr. Warner.

It is well to see ourselves as others see us, and take courageto press on in work that is good for the worker, beneficial to the community, and which may exert a wholesome influence far beyond the confines of our shores. It is well also to note that Britain as a nation is not, as pessimists would imply, behind all the world in everything, but can even win encomiums from representatives of what is admittedly one of the most enterprising nations of the earth. The Great Republic of the West, in whose marvellous progress we take just pride, has taught us many things besides the value of Tomatoes, and it is well if we can teach something in return of a tendency to add to the comforts and pleasures of domestic life. The enterprise of its people has taught us something commercially-namely, that the produce of one country is good for another, and that by skill in production and methods of presentation each may share in meeting the wants of the other to the benefit of both. That both have been benefited by the interchange of commodities is indubitable, though we do not vet work on equal terms.

With all our faults and failings the Old World remains more liberal than the New in tariff arrangements. The disadvantages on this side rest with producers, while on the other they press heavily on consumers. The "greatest good to the greatest number" is the keystone of the policy of Britain, but the "most wealth to the fewest persons" would appear to be the predominating factor in moulding the customs and framing the laws of greater and newer countries. Yet one has become accustomed to the methods of the other, and all may work in friendly rivalry. The latter, after all, is the important point, for friendly rivalry is the great lever of trade development; friction, through mistrust, ever impeding commercial progress. We will send to other lands whatever we can place in their markets in better form at current prices than they can supply: and we will also strive to excel in such products as our land affords for the needs of our own people. It is a case of

turning to the best possible account the natural resources and local peculiarities everywhere, and sending the products everywhere else, where they will command the attention of purchasers. Possibly we have not done all we could and ought in this direction, and our competitions have become our educators. May we profit by the lesson.

The foregoing is a prelude. Though the pleasant experience at Trentham would entitle the day to be regarded as "Anglo-American," another day is more particularly in mind, not less pleasant to those who spent a little time together in seeking to impress on an American mind that we have something worth seeing a little different from the scenery in the States, as well as examples of cultivation that we consider well representative of British horticulture both as viewed in its useful and ornamental aspect. An American florist of repute is visiting the Old Country, from which he took his departure forty years ago, and has won fame and fortune in the land of his adoption. In sturdy build and steady speech Mr. Palmer of Buffalo, New York State, might be taken as a typical Englishman, but his mind and lingual characteristics are distinctly American. He believes in dollars, and can "guess" as well as any native-born New Yorker. But he is not ultra-prejudiced, and can recognise what is good wherever he may see it, and when he does see something of particular merit he appears as if instinctively to appraise its "worth" He is great, among other things, in Carnations and Roses, blooms of which he grows extensively and profitably for sale. "Yes, sir," he will say, "we can beat you in these-growing them under glass in winter; but you can beat us in" (and who could anticipate the conclusion of his sentence) "in crooked country lanes and hedges."

Mr. Palmer has doubtless seen a great deal more in England than he did last Saturday; but he saw what he wanted in what are left of Carnations at Slough, as well as Roses in pots being grown for specimens, also Turner's new Crimson Rambler, which has caused somewhat of a sensation, growing alike in pots and in the open ground in the nursery. As to Carnations, it may be interesting to know what Americans think of varieties and methods of showing them. The paper collar style is to them an abomination, and they will not look at a flower twice that is not supported by a stem strong enough to hold it boldly, firmly, upright. In America the flowers are shown on stems a foot or so long in clear decided colours, and as large as they can be produced by cultivation and disbudding, these being the kinds that bring in the dollars. They are raised early in the year, planted out, generously treated, topped once or twice, carefully lifted in September, and planted on benches in large light houses for affording blooms through the winter and spring, one only on each stem, and as many stems as practicable without overcrowding. After blooming, the plants are thrown away, young stock alone being relied on for producing the coveted blooms. "Malmaisons" are not yet grown to any great extent in America, but when it becomes known that they are among the favourite flowers with our aristocrats and millionaires they may perhaps "take" among the Democrats and Republicans, who appear to have a sneaking fondness for exalted personages, and it is pretty well known that strenuous endeavours were made to obtain the presence of Royalty at Chicago.

Returning to Carnations. The bold-stemmed, free-growing border varieties, Mrs. Apsley Smith and Queen of the Bedders, attracted the Buffalo florist. The former is the brightest of flame scarlets in the collection, and the robust plants had passed through the winter unscathed. It is most effective in a glowing mass, also valuable for affording a wealth of flowers for cutting, and their size would be increased by disbudding. Queen of the Bedders is similarly bold, hardy, and free, with large, smooth, salmon-pink blooms, and altogether a first-class border Carnation. King of Scarlets comes within American "claims" in character, and two or three of the yellow ground Picotees found favour with

the specialist—notably, Countess of Jersey, a fine variety; Annie Douglas, very large; and Mrs. Sydenham, rich in ground colour, and chastely margined with reddish-pink. Iver White was considered the best of the early white Carnations.

In America Roses are produced much in the same way as Carrations. Vigorous young plants grown in beds of soil 4 or 5 inches thick on benches, flowered once then thrown away. Plants 8 feet high in pots of Maréchal Niel and others, including the new Crimson Rambler interested the visitor at Slough, and he recognised the excellence of the work in producing them, as he did the specimens in pots for producing forty or fifty fine blooms next year; and it may interest growers of Roses in pots to know that Mr. Turner finds that the best time for repotting the plants is soon after they have bloomed, keeping them under glass for a few weeks and duly syringed, then removing them to the open air. That is not the plan adopted by the majority, though it is the practice of the most successful growers. A line about the new Rambler in the open ground. The growth is marvellous, and the adaptability of this distinct Rose for pillars, arches, walls, hedges, or any other space that requires covering with wreaths of semidouble crimson flowers can no longer be doubted. It is probably destined to find its way into most gardens in most countries. The Manetti stock suits it to perfection.

Now we start for the picturesque and ancient arboricultural scene afforded by the historical Burnham Beeches. Passing East Burnham Park, the country residence of Mr. H. J. Veitch, where much was evidently being done in beautifying the grounds, and in which a new gardener's house was observed—good, we may be sure —we twist and turn down the embowered lanes in which we "whip" even the U.S.A., and soon find ourselves in the forest. It is, with a little open common land, 374 acres in extent, the property of the Corporation of London, free for the citizens and for all whencesoever they may come. Mr. Forbes, the Ranger, says in his concise "Guide," "the trees are among the existing remnants of the ancient forests that once covered the greater part of Britain, and Burnham Beeches will bear comparison for hoary antiquity and sylvan beauty with any forest scenery in Europe." No doubt he is right. By whom or when the trees were last pollarded no one knows, but it is centuries ago. The result of it is that each gigantic trunk, with its grotesque contortions, supports a number of branches of tree-like dimensions, and though several of the trunks are mere hollow shells, and the half of some wasted away in the lapse of centuries, the young growths are as healthy and the leafage as fresh and green as on many youthful trees. These relics of past ages have their local names founded on structural Thus the "Elephant" and the "Camel," from peculiarities. fancied and not far fetched resemblances to those animals, while Gray's tree commemorates the name of the famous poet whose remains rest at Stoke Pogis near by. There are numbers of these trees, but the "Queen," standing alone on the margin in solitary majesty, is the monarch of them all, strong, sound, and healthy, with still a long future before her, typical let us hope of the life of our noble Queen, whose magnificent home is in view beyond the trees. But we must pass on, though not before recording the American's notions. Have you, Mr. Buffalo, any such Beeches "No, sir, we have not, and I guess if some of our people had them they would think they were not worth much, and pretty soon turn some of the wood into fuel. Mind, I don't say I should, but some of the boys would not be long before they did some clearing.'

"Dropmore" was the word given to the coachman, and in twenty minutes we were shaking hands with Mr. C. Herrin, the able and courteous gardener there. Fair is the scene from this mansion of the Fortescues, with the towers of Windsor in the distance. Richly is the country wooded all around, the blue Surrey hills rising above the trees, forming a splendid background to a real English landscape. Quaintly interesting is the long terrace in front of ancient glass structures and unique apiaries.

Pleasurable it is to see the beds of old English flowers, with brighter masses of exotics to enliven the scene, and the stately woolly-headed Thistle, Carduus eriophorus, in bold contrasting effect in the borders. Blue Chinese vases and pedestals collected by the late Lord Grenville are a feature, and stand all weathers in an avenue between and among the flowers. Cool are the glades of noble trees, and then in openings in the wood beyond are the famous Conifers, splendid in stature, health, and contour -monuments of the late Mr. Phillip Frost, who planted them. The noble Douglas Fir, 120 feet high, the glory of the fine old place; while others, such as the gigantic Araucaria, graceful Abies Albertiana, weeping A. Morinda, and massive Pinus insignis, with several more falling little short in beauty. As their dimensions were recently given in the Journal of Horticulture (page 312, April 20th, 1893) it is not necessary to repeat them. A glance through the Peach houses containing splendid fruit, and with an expression of surprise that Mr. Herrin had kept things so fresh with no rain to speak of, and a nearly exhausted water supply, we took a hasty departure. And what do you think of this, Mr. American? "Well, it's very good and very fine, but your gentry keep the wood growing till it's worth nothing, and I guess our people would have some of it out sooner - before it was spoiled." This in reference to the old plantation trees through which we passed via Cliveden en route for Windsor. Looking over the wall our friend guessed Cliveden was bought by one of his people. "The richest man in America, worth £40,000,000, Mr. Astor." He supposed "our man" had to sell it because he wanted money, but was promptly told "No" by an ardent Englishman from Germany, as "the Duke of Westminster could buy Mr. Astor out and out, and then have plenty to spare!" What sturdy Britons our naturalised citizens become! A native would scarcely have made the correction in that form.

Windsor, or rather Frogmore, for we entered on the Datchet side, was reached under a slanting sun, just the time to run through the houses comfortably and see the home park in fullest beauty, with the shadows of the trees reaching far across the grass, and golden streaks of sunlight playing between them. It was calm, cool, and restful, a perfect evening after a somewhat fatiguing day, yet a day as the law-made loyal Britain said at its close, "long to be remembered." The district around Windsor has borne the brunt of the drought. Large Elm trees on the way appeared as if roasted, and hedges were sere and brown. The rainfall at Frogmore was 1.70 inch between the 4th of March and 4th of July, surely the driest experience yet recorded.

"Look out for red spider" was the silent thought as we entered the Peach ranges. Healthier, cleaner, greener foliage was not to be seen, and Walburton Admirable Peaches weighed 1 lb. each and more. Most of the trees were cleared of fruit. The demand has been unusually great and met, with abundance to follow on the outside walls. Not a sign of red spider to be seen on the trees inside or out. House after house cleared of Grapes, but a good supply still left for later use. Young Vines, two years planted, bearing heavily, and last year's planted Muscats carrying two fine bunches each at the base of splendid long, strong, and short-jointed extension canes — two from each Vine. Earliest Vines nearly ready for pruning; second house maturing fast, but shaded. "Shaded," does someone exclaim? Yes, shaded. Mr. Thomas does not work by rule of thumb, but according to circumstances, and wishes to keep the foliage working a little longer than it would under brilliant sun. He would shade Melons rather than have injured and consequently ineffective leaves. Speaking of Melons reminds of a house of the new Frogmore Seedling (recently certificated), the plants swelling a full fine crop. The variety is evidently as free as it is good, but, like all Melons, to develop fullest quality there must be no premature collapse by exhaustion.

We climb up and look down into the Pine pits. Splendid are the plants in sturdiness and colour with fruits of Smooth Cayennes twelve pips deep. One smaller fruit is ripening, produced by a rootless sucker inserted only ten months ago. Is not this going to beat the record? We pass by lines of Tomatoes. "Ah, yes!" remarks the American, "we can grow and sell them at half a dollar a bushel, and you can't beat that, I guess." No, our price is about 6d. a pound, rather than 6d. a peck. A house—a long case of cordon Pears—will be a feature of interest in a year or two, and useful withal, as the best of fruit will be a practical certainty. We have a glance, just a glance, in the plant houses, and note the same health and cleanliness that prevail in the fruit department. Nepenthes were luxuriating, the not often seen N. lanata thriving and pitchering well. Everything is grown for castle and palace, and the choicest and best plants have to go on great occasions. The long conservatory was gay with many flowers, including one that would not be thought "valuable" enough by many a parvenu. It is a Godetia, the seed of which Her Majesty brought from the Continent; the flowers crimson with white rays—a really effective variety, and notwithstanding its simplicity, perhaps because of it, found favour with the Queen.

We could only look at, not through, the kitchen garden of fifty acres, for we have yet to see the terrace, and arrive just in time to view from the battlements of the majestic castle the sun sinking behind the distant hills. We look down on the dizzy depths, peering between the tree tops into the grassy dells and beautiful slopes below. We walk round the horseshoe shaped terrace, and admire the beautiful enclosure in which flowers, ornamental shrubs, and statuary combine to produce an altogether charming effect on the smooth emerald turf. The long walk, or avenue of magnificent Elms, stretches far away, its dignity not being lessened in the first faint suffusion of twilight, and we pass through the precincts into the town.

Now, Mr. Palmer, we have shown you the best we can of what we think great and good in park and garden scenery, and of English garden culture in its broadest aspect by a master in the art. Are you satisfied? "Yes, perfectly; it is fine all through and good all over; the under man has to admit himself beaten, and you are at the top this time anyhow. But don't forget to call on me in Buffalo when you are passing."

Thus ended our Anglo-American day. Our friend will not forget it when in his far-away home, while those who formed his escort will long remember with pleasure his genial company and naive comments. We all join in a hearty vote of thanks to Mr. Harry Turner for his good guidance, and the indulgent reader will, mayhap, not object to this narration during holiday time.

CYPRIPEDIUM × WINNIANUM.

This charming hybrid is the result of a cross between C. Druryi and C. villosum, the former being the pollen parent. A plant of it was exhibited by Messrs. J. Veitch & Sons at a meeting of the Royal Horticultural Society on February 14th of this year, and the Orchid Committee deemed it worthy of an award of merit. The bloom is a harmony in brown. The petals are deep brown on the upper part, lighter below, with a broad central stripe. They are rather blunt and incurving, as shown in the illustration (fig. 12). The lip is light brown, and the dorsal sepal purplish brown, edged with lemon, and margined with white.

PHALÆNOPSIS TETRASPIS.

ALTHOUGH introduced into English gardens from the Andaman Islands by Major-General Berkeley twelve years ago, and described at that time by Reichenbach from a plant flowered by the late Mr. John Day as "a very free-flowering species, bearing a rich panicle of ivory-white flowers in the way of P. violacea, delightfully fragrant," this Phalænopsis is, says a writer in a recent

number of the "Garden and Forest," rarely heard of amongst cultivators. There were several plants of it in flower at Kew a short time ago. Each flower was 1½ inch across, with broad, fleshy, pure white sepals and petals, and a narrow, hairy labellum blotched with yellow. According to General Berkeley this species grows on Mangrove and other trees in muddy swamps at the extreme end of the creeks where the water is fresh, and where the plants hang from the branches a few feet above the water, growing with extraordinary luxuriance.

PLEIONES.

THESE charming little Orchids are invaluable where cut flowers are required. Considering they are so easy to grow it is surprising we do not see more of them. Anyone possessing a warm greenhouse or stove need not be afraid of disappointment. The pseudobulbs after flowering should be allowed to rest a short time, but

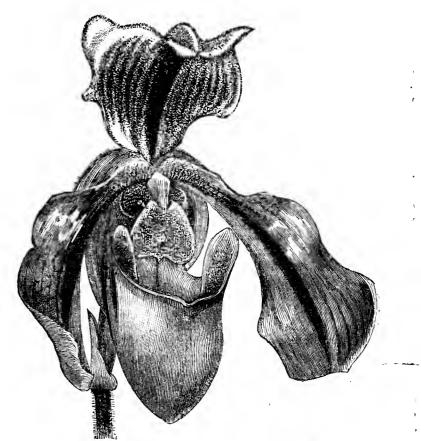

FIG. 12.—CYPRIPEDIUM × WINNIANUM.

never be quite dry. When the young growths are about 1½ inch long the pseudo-bulbs should be taken out of the pot and separated, carefully removing all the old compost from them, cutting the old roots to within about an inch of the pseudo-bulb; the portion left serves to keep them firm in the pot. They must be carefully washed to clear away any traces of scale, to which pest they are very subject, and which is very troublesome if allowed to run on the young leaves.

The compost I use, and better results cannot be desired, is good fibrous peat and chopped sphagnum with a liberal proportion of nodules of dried cowdung and charcoal, and a good sprinkling of sharp sand mixed well together. Six-inch pots half filled with potsherds are employed. The pseudo-bulbs, five or six according to the number of young growths, are potted firmly, raised above the rim of the pot. Afterwards place them in a temperature of about 50°, and keep them damp but not wet until the new roots have reached the sides of the pot, then an increase of heat will be advantageous. We are always careful not to wet the leaves, or they will soon become spotted and will decay prematurely. As growth advances the pots are occasionally plunged in weak liquid manure up to the pseudo-bulbs. Continue this about twice a week until they have swelled; they will then require less water, and may be placed in a cooler part of the house. In due course the leaves will ripen and fall, and the flower buds appear.—Specialist.

SPRAYING VERSUS INSECT PESTS AND FUNGOID DISEASES.

THE question is no longer "Shall I spray?" but "When and how shall I do it?" Such is the heading of a leading article of a paper received recently from America. Agriculturists and horticulturists are now fully realising that they must fight hard against the ravages of insect pests and fungoid diseases if they wish to ensure a remunerative crop in field, garden, or orchard

Fruit trees, Vines, Tomatoes, Potatoes, and Onio: are alike

attacked by these pests, and the results obtained on the experimental stations in the States and also in England, prove without doubt that at present the only way of dealing successfully with these natural enemies of the plants in question is by spraying. Poisonous solutions must at all times be dealt with cautiously and by reliable men. Such mixtures to be effective must also be properly made, or a failure exposes the whole thing to ridicule. It is my intention to speak of the easiest and safest method of preparing the Bordeaux mixture so greatly used for Vines, fruit trees, Tomatoes, and Potatoes. This mixture should now be applied by all gardeners in the country as a test upon the Potatoes. In a week or two the disease will be rampant, the weather is now suitable for its propagation, and we must give the first dressing before the fungus commences its raids. The experimental plots in this district have all been sprayed, and we are now hard at work upon the cottagers' allotments and the plots in fields and village gardens. By the time we have been round once I anticipate 15 to 20 acres will have received treatment.

The mixture is very easily made in large quantities, but small brewings require greater care and consideration. I will, however, deal with each case. We want a solution of copper sulphate (blue vitriol), some freshly slaked lime, and a supply of water. The mixing apparatus consists of two wooden buckets and a tub holding from 10 to 20 gallons. Take 2 lbs. of copper sulphate, dissolve it in a bucket containing a gallon of hot water, stirring it well until the copper is dissolved. Slake about 1 lb. of fresh quicklime in the second bucket, and when slaked add about another gallon of water and stir the whole until the water is quite milky. Place 8 gallons of cold water in the tub, and when the contents of the first bucket are cold mix the whole 10 gallons in the tub, stirring vigorously with a stick, and the solution is ready for use. This is sufficient to spray 10 perches, and the cost does not exceed 1s. 3d. The mixture is much more easily made when large areas are to be dressed. Suspend a sack containing 40 to 50 lbs. or more of copper sulphate in a tub in which there are 20 to 40 gallons of cold water. The copper dissolves, and we can soon obtain a solution of 25 to 30 per cent. of copper. Having a 25 per cent. solution, about 3 gallons of this will make 40 gallons of the bouille.

this will make 40 gallons of the bouille.

After mixing the copper and water, slake about 2 lbs. of lime and add as before, stirring during the whole process. The lime is added simply to neutralise the acidity of the sulphate, and less than the above quantities may be used; but if it is not of good quality and slakes badly, the time to cease adding milk of lime is detected by dropping in one or two drops of a solution of ferrocyanide of potassium. This poisonous solution gives a deep brown colour if the copper is not neutralised, but remains unaltered in colour if there is sufficient lime. A good spraying machine is Vermorel's Eclair, and this before long will come into general use for spraying. It can be used with advantage for fruit trees and vegetables, but in this country it is as yet little understood, and even the time to use it is unknown to many practical men. Since writing the above I have found a plot of Schoolmaster Potatoes badly diseased. The plot is low-lying, shaded by Apple trees, and Mangolds were grown on it last year. In other parts of the garden Schoolmasters are as yet untouched.—EDWARD H. SMITH, Warminster.

(To be continued.)

PARSLEY FOR WINTER AND SPRING.

THERE are few gardens, either large or small, in which this indispensable herb is over-plentiful during severe winters, but there are many in which the supply has not been equal to the demand, and it is on record that "market men" who have made a "lucky hit" with it during such seasons have reaped a richer reward than any other crop is capable of realising. At other times, when mild winters have been experienced, this self-same herb has been a drug in the market. Whatever weather is likely to come it is wise to be prepared for the worst. The produce of sowings made in early spring and during May will keep up a constant supply till very severe weather is experienced, and on no account should the winter supply be drawn upon until that from other sources is quite exhausted. Much may be done to economise by attending to this point, for there is generally too great an inclination to pick from sheltered positions as soon as a few degrees of frost are experienced. Although the leaves may be frozen stiff and look uninviting, if placed in cold water and gradually thawed they will serve for all purposes, and, moreover, be a distinct gain.

Moreover, be a distinct gain.

No matter how exposed a position Parsley is grown in, it is seldom much disfigured by frost unless it is continuous. Then is the time to draw upon the supply which has been prepared for use during severe weather and throughout the early spring months. A good sowing should be made as soon as possible to provide this supply. If space at the foot of a south wall is available the ground should be prepared by forking in a little old hotbed manure, or leaf soil and wood ashes if the land is heavy. A shallow drill ought then to be drawn a few inches from the wall, in which the seed should be sown thinly.—D. W.

THE N.R.S. CATALOGUE.

"AUDI ALTERAM PARTEM," in your last issue, referring to the National Rose Society's new catalogue of exhibition and garden Roses, says that "no Rose grower of taste, unless an exhibitor, would be influenced in his selection of Roses for his garden by this 'official guide.' It leaves out many of the best Roses for garden and house decoration, and recommends others that no one but an exhibitor would

care to grow."

Now, this strikes me as a very sweeping, and at the same time misleading statement. In the first place I know dozens of non-exhibiting rosarians who have warmly welcomed the appearance of this new catalogue, and who regard it as a trustworthy guide, philosopher, and friend, in the selection of Roses for their gardens. It certainly contains a list of exhibition Roses, a small proportion of which cannot be recommended to amateurs generally; but on the other hand, half the catalogue in question is devoted entirely to the description of varieties suitable for garden decoration and general cultivation, Roses which would be quite out of place in any collection grown exclusively for exhibition purposes. In fact, the catalogue recently issued by the Society was not in the first instance intended for cxhibitors at all, but for its non-exhibiting members. Your correspondent appears to be of opinion that the National Rose Society "is only an exhibitors' society," whereas more than two-thirds of its members have probably never exhibited a Rose in their lives. It may also surprise him to hear that the entire cost of the new edition has been defrayed by exhibitors, and that it has been issued by the Society more especially for the benefit of their non-exhibiting brethren.

The new edition, which is bound in cloth and illustrated, contains descriptions of nearly 300 selected Roses, many of which are as yet to be found in very few trade catalogues. If any of your readers would like to judge for themselves as to the value of our new catalogue, I can only say that I shall be happy to supply them with a copy at the small cost of fourteen stamps.—Edward Mawley, Rosebank, Berkhamsted,

Herts.

Roses and Rosarians.

It is very strange to see the contemptuous way in which lovers of Roses who are not exhibitors speak of those who are. Anyone may accuse anyone else of want of taste if their likings do not coincide, and such accusations against exhibitors are common enough in newspapers with a column or so devoted to gardening, though one does not expect to find them in the Journal, and I do not remember ever seeing an exhibitor hit back by condemning the lovers of garden Roses for want of taste. But to go farther and accuse exhibitors of ignorance, as "Audi Alteram Partem" seems to do by saying it is "amusing, on a question of accuracy, to find the new N.R.S. Catalogue set up as an official guide," is "rayther too rich," as Sam Weller would have said. Some items in that catalogue may be open to criticism (I hope to make some humble ones myself before long) but it is prepared by men who are without question the highest authorities on the Rose in all its branches, most of whom make it the special study of their lives. Surely, in any other branch of art, science or manufacture, the "amusement" would come in when such a compilation was denounced as untrustworthy by an outsider, without any proofs and merely upon his ipse divit. Whether it is "amusing" or not to find, after the statements of "Audi, &c." ("it leaves out many of the best Roses for garden and house decoration, and recommends others that no one but an exhibitor would care to grow. But then it may be said that the so-called National Rose Society is only an exhibitor's Society") that the catalogue in question contains eleven pages of exhibition Roses and twelve of garden Roses of every description and species, must be left to the readers of the Journal to decide.

It was plain to anyone acquainted with the catalogue that the mention of it as an official guide in the letter of "A Jubilee Rose Grower" referred to the statement as to the raisers and dates of the different Roses catalogued, which is the result of thorough investigation by the best au horities, and may be relied on as impartial. Other points in the letter of "Audi, &c.," might possibly be found "amusing" by an irreverent peruser, but I leave him and Rev. D. Williamson in the able hands of "A Jubilee Rose Grower," with each word of whose letter I heartily agree. I trust, however, that "an oäsis in the desert" of the Rose column of the Journal may still be found occasionally from the pen of Mr. Williamson, whose writings have caused real amusement to others besides myself.—W. R. RAILLEM.

Your fluent correspondent, Mr. Williamson, should not attribute motives to persons who may venture to differ from him in a respectful manner on a point of form. I had not his visit to Waltham the least in mind when I sent the short note to which he refers on page 51 last week. I had noticed, as have others, his tendency to direct public attention to his personal friendships and distinguished associations, and

to appear to make these even more prominent than the legitimate subjects of his communications. That is the Society paper style. Some persons enjoy public familiarities, others do not. It is not long since I had the pleasure of a handshake with the genial President of the National Rose Society, and I have had many such pleasures over a long series of years, but I should shrink from publicly proclaiming anything like "intimate personal friendship" on the ground of such acquaintance. The same remarks apply to Mr. William Paul. I hold both these gentlemen, and notabilities of the Rose world, in great respect; but why should I tell it from the housetops to a circle of readers who care nothing about my connections? I could not do it except under the shelter of a nom de plume, and that is not doing it at all in the sense to which the reference applies.

A word about these terrible noms de plume and the heinousness of "anonymity." Permit me to say I think there is a great deal of cant written on this subject. All the best leading articles in the world are unacknowledged by the writers of them. Would Mr. Williamson or his supporter denounce a Times leader that praised them or their work because the writer, whom we will call John Smith, did not append his name to it? Does your correspondent first alluded to (I try to avoid introducing his name needlessly) object to the letter of "Audi Alteram Partem," and think it should have had a place "elsewhere," because the writer prefers to withhold his name? the same writer, be it noted, applauding the "courage" of the gentleman he defends, but whose example he does not follow.

Again, let me ask why did the courageous writer, who is so fond of introducing names, withhold the particular name of the great rosarian who praised an article so highly for its "literary mcrit and marvellous accuracy?" It seems even Mr. Williamson can suppress a name when it answers his purpose, though, considering his proclivities, he might be supposed to be the last man to do so.

I am sorry he has introduced this subject, but having done so the rejoinder is imperative. Please let it be understood that I do not wish for your correspondent to disclose the names of either of his two admirers whom he conceals. He is quite justified in doing so, and there are plenty of names without them. Critics should do all they can to be consistent, and writers on Roses or anything else treat the subjects fairly on their merits and not make them vehicles for scattering compliments in prodigal profusion on friends and acquaintances; or, may I add, for speaking scornfully of the work of others, as for example the N.R.S. catalogue. Give credit where credit is due for good work well done by all means, but do not overdo it, or in the estimation of many it will degenerate into mere laudation of no value to anyone. Mr. Williamson evidently has the pen of a ready writer and is apparently sympathetic. Let him steel himself against his tendency to flatter individuals, and let his pen be guided more by his head, less by his heart, and he will shine the more in horticultural journalism. I may not live to see, yet I suspect the time will come when he will acknowledge that someone has done him a service in this discussion, though at the present moment he cannot be expected to admit that his friend is—A Jubilee Rose-Grower.

N.R.S. Worksop Show.

LET me first congratulate your representative on the admirable report he has written on this Show, and also on the very keen discrimination he has generally given evidence of in that report. Although I do not agree with every item of his account, yet I do with the greater part of it, as being far above the average in appreciation of merit in Roses.

My reason for writing this letter is in consequence of his remarks on the thirty-six trebles of the large trade growers. He says, "Both were splendid stands. Messrs. Dickson had the cleanest flowers and the most variety, but Messrs. Harkness had the heaviest blooms." Of course he may mean variety of colour by "most variety," but there must be and only be thirty-six varieties in this class, so that the expression "most variety" hardly correctly applies; but when he goes on further to state that Messrs. Harkness had the heaviest blooms as contrasted with the freshness of those of Messrs. Dickson he brings me to the subject of this letter.

There has been grave dissatisfaction on many occasions this year, and I have myself, although fairly successful at all the shows I sent flowers to, been a sufferer by this very method of judging Roses by weight as opposed to freshness. It is an utterly incorrect system, and one which I regret to say the professional element of the N.R.S. are more prone to give attention to than amateurs, although some of the N.R.S. amateur authorities sin also. It is time that attention should be drawn to this question, and that some discussion took place in some leading horticultural paper. I dislike judging with people who ignore the Rose "in the most perfect phase of its possible beauty" (N.R.S. definition of a good Rose), and surely freshness is an absolute necessity for this desideratum, and not mere size. See also N.R.S. rules for points—"Where flowers are of equal merit judges shall consider arrangement, freshness," &c.; and this, I state, some judges ignore! I am not averse to saying in public that although my vote may be outweighed by the majority (when there are three), I always have and shall give preference to the exhibits that are staged fresh to those that are merely large, this being the true reading of our rules, and the method that should be carried out at shows under N.R.S. rules. I would like to emphasise the fact, however, that all Messrs. Harkness' flowers were fresh, and that consequently in the instance which has called forth these remarks the question of freshness versus size did not apply. Both

boxes were beautiful, and throughout their exhibits at Worksop the same may be said of Messrs. Harkness' and Messrs. Dicksons' flowers.—Charles J. Grahame, Croydon.

THE FRAGRANCE OF ROSES.

It was the immortal Shakespeare who said, in the most romantic of all his dramas—"Romco and Juliet"—"A Rosc by any other name would smell as sweet." Nevertheless, it cannot be denied that certain names of Roses, such, for example, as La France and Marie Baumann, are suggestive of fragrance, while others are not. And doubtless the want of fragrance in a flower, however imposing in appearance, is a serious limitation, almost as regrettable as the lack of moral sweetness in a beautiful woman. Some Roses indeed are so very impressive, so commanding in their size and substance and splendour of complexion, that we almost forget their utter ignorance of odour in the contemplation of their almost imperial majesty, and among these we may reckon Baroness Rothschild ("who would be white if she were not always blushing, as if in the consciousness of her beauty," says the Dean of Rochester), the White Baroness, and Merveille de Lyon. The two beautiful Roses last named are closely affiliated to the first, and, unless in colour, partake of the parental qualities and characteristics, a fact which may be learned by any rosarian without reference to the catalogues, by comparing their nature and manner of development.

In my own garden, where for the sake of their colour not less than their fragrance, the fairest flowers are partially shaded from the oft-times too exacting sun, Roses are arranged according to their parentage; an interesting experiment, and a valuable one also, as I have already learned from experience, for the study of their attributes. There White Lady, which I have frequently eulogised for its exquisite perfume, finds itself in close proximity to Lady Mary Fitzwilliam; while Margaret Dickson, the most superb and majestic of ivory-white Roses, is not far distant from Merveille de Lyon, though considerably nearer to the prolific Lady Mary, from whom her fragrance is derived. On the same principle, Augustine Guinoisseau, one of the most fragrant of modern Roses, blooms sweetly beside the silvery pink La France. The colour of the former is white, delicately and most gracefully suffused with rose. It is a very abundant bloomer, and its pendulous habit is a valuable characteristic, constantly giving it the appearance of being much fuller and more perfect than it is. Though I do not profess to be a great authority on Rose cultivation, I do not hesitate to recommend this "almost white La France" to those of my readers to whom it is a stranger by reason of the qualities to which I have referred.

Among Teas and Noisettes two of the most attractive are L'Ideale and Souvenir de S. A. Princc. Mrs. Paul, a gold medallist of the National Rose Society, and probably the finest of modern Bourbons, has a most delicious fragrance, much resembling that of the old Monthly Rose; it is also remarkable for form and substance, and is altogether a distinct and splendid acquisition. Among other comparatively recent productions which I find irresistibly fascinating by reason of their sweetness of odour and aspect are Mr. Paul's Corinna and Salamander, Mr. Cant's Prince Arthur, the beautiful Aberdonian Duchess of Fife, Lady Ethel Brownlow, Mr. Cranston's Crimson Bedder, and the late Mr. Bennet's Mrs. John Laing. There is unquestionably at present a strong and growing aversion to inodorous Roses, and I doubt not that ere long a Rose without fragrance will be accounted an anomaly.—DAVID R. WILLIAMSON.

OLD ROSES AT KIRKCONNELL, DUMFRIES, N.B.

THERE are many interesting plants in Mrs. Maxwell-Witham's garden at Kirkconnell, and on a recent visit there I noticed the beauty of the great bushes of the old Roses which have been in the garden for many years. They are mostly in great masses, which have been for long unmutilated and allowed ample room. It is in masses such as these that the old Roses are seen to most advantage, and one is led to wonder if our newer flowers such as Her Majesty will ever lend themselves to such grand effects as are produced by the older sorts.

The old Maiden's Blush—a mass of bloom—is about 6 fect high. One known as Carmine Rose grows about 8 feet. A white one called St. Margaret's Rose, which always flowers about June 10th (St. Margaret's Day), is very fine. Swiss Boy is also very pretty. One which is said to be exceedingly rare is known as "Kirkconnell Favourite," and one bush was measured 5 feet high and 16 feet through—a mass of beautiful pink flowers. The York and Lancaster is also growing luxuriantly. The Scotch Roses—yellow, marbled, blush, white, and dark pink—also form magnificent clumps, which are very beautiful in their season. Rose Celeste and Maiden's Blush are great favourites, the former being deliciously fragrant. The little Cinnamon Rose, growing in a hedge, is also much esteemed for its fragrance. A beautiful white spicy-scented Rose called "Plum Cake" is also in the garden, while the white Provence Rose also does well. The front of the house is covered with a fine tree of Dundee Rambler, planted nearly sixty years ago, which covers the house with a mass of beautiful flowers. Some rare single Roses are grown outside the garden, and the old Crimson Velvet Rose flourishes, while the Ayrshire Roses climb luxuriantly in suitable positions.

Roses of the most recent introduction, such as the beautiful Gustave Piganeau are likewis: appreciated at Kirkconnell, but after all these great masses of garden Roses from their beauty and associations must always remain a feature of the greatest interest in such fine old gardens as this.—S. Arnott.

CHRYSANTHEMUM PROSPECTS.

SEVERAL well-known trade and amateur growers are of the opinion that the present spell of moist, rainy weather will, after the long drought, start the plants into rapid growth, and thus delay bud formation, by which, instead of the season being an early one, it is more likely, in their opinion, to be rather late. It would be interesting to know how far this view is held by cultivators at large.

A JAPANESE CHRYSANTHEMUM SHOW.

To those who have no idea of what a Chrysanthemum show is like in its native country, it may be useful to point out that in a collection of pictures by Mr. Alfred Parsons, now on view at the rooms of the Fine Art Society, 148, New Bond Street, there is a charming little piece of water colour drawing (No. 90) entitled "A Chrysanthemum Show, Yokohama. November." A covered building of bamboo with a wide opening in the middle of the roof through which a delicious fine sky is observable, has a bank of large-flowered Chrysanthemums on each side securely sheltered from the sun and wind. The flowers are big, massive, and of all colours, and the plants appear to be sunk in the ground, as no pots are visible. They are railed off, and a large open space is left for the public to walk about in. Ten or a dozen Japanese in native costume are enjoying the show, which is depicted so well by Mr. Parsons. The colours of the blooms are mostly white, yellow, purple, and crimson. The picture is bright and clear, and such an exhibit at any of our shows would meet with a very favourable reception.

CHRYSANTHEMUMS IN NEW ZEALAND.

The flowers staged at the recent meeting of the N.C.S. at the Aquarium were in some respects less interesting than those sent over by Mr. Earland, which were shown last September. On that occasion the varieties were stated to be seedlings raised from Colonial saved seed, and were all named by the raiser. The four blooms sent from Sydney were fairly well grown, but unfortunately no information was forthcoming as to whether they were true Australian seedlings or only oldestablished varieties. From correspondence read by the Secretary and by the Foreign Secretary, it appears that there had been for some time previous to the holding of the New Zealand shows a great deal of wet weather, and as the Colonial growers do not resort to protection of any sort the exhibition suffered somewhat severely. The weather in Australia has also been unfavourable for the popular flower.—P.

NATIONAL CHRYSANTHEMUM SOCIETY.

A SPECIAL meeting of the General Committee and the Floral Committee was held at the Royal Aquarium, Westminster, on Friday last, the principal item on the agenda paper being the consideration of some Australian-grown Chrysanthemums, which had been frozen in blocks of ice, and sent to the Society for adjudication. Mr. R. Ballantine occupied the chair. After reading the notice convening the meeting, mention was made of the death of the late Mr. E. Saunderson, for many years President of the Society. The Chairman announced that the funeral was attended by himself, the Secretary, and several other members, and that a wreath was sent in the name of the N.C.S.

The Secretary read a letter from the Auckland (N.Z.) Chrysanthemum Society concerning their recent Show, at which many novelties had been staged, the chief of which were W. Tricker, Viviand Morel, Miss Anna Hartzhorn, E. G. Hill, Gloire du Rocher, Eynsford White,

and Lilian B. Bird.

Mr. Harman Payne read some interesting correspondence from New Zealand relating to the frozen blooms sent out by the N.C.S., which had been exhibited at the Wellington and Christchurch Societies, and were to be sent to other places in the Colony. Large numbers of visitors had paid for admission to see the English flowers, and it was confidently felt that the experiment would result in a large increase of growers in New Zealand. The incurves were particularly admired, and

nothing so perfect had ever been seen there before.

Mr. Dean announced that the blooms then on the table were grown by a Mr. R. Forsyth of Sydney. This gentleman was a prominent exhibitor at the Sydney Show, and a successful prizewinner. It was to be regretted that the names of the blooms had not been communicated, because in the frozen state, which caused some degree of discolouration, they could not be identified with any certainty. One of the blooms was a large incurved Japanese of the Lady Lawrence type, the colour being a dirty white. Another was of the build of Bouquet Fait, of a decidedly brownish tinge, but of good size and substance. The third was a very flat, broad-petalled, incurved Japanese flower of light bronze, and the fourth bloom was an incurved with very close regularly disposed petals, and of a deep bronze or cinnamon yellow. A liver medal was awarded for the exhibit.

Mr. Jukes thought that although the sending of such exhibits was interesting they had but little educational advantages, and could only be regarded as curiosities. He thought the Society, now that they had

a fair idea of the way the Chrysanthemum was grown in the Antipodes, should be on their guard against encouraging too many exhibits of this sort, as it caused considerable expense for carriage and cold storage.

Mr. Cannell received a vote of thanks for staging some seedling Begonias, one, a deep double crimson, attracting much attention.

Several questions submitted by affiliated societies were disposed of, and it is a gratifying proof of the usefulness of the scheme for affiliation to find that disputes are so readily settled by the ruling of the parent Society.

FLOWERS AT READING.

A visit to the nurseries and trial grounds of Messrs. Sutton & Sons the other day revealed the fact that Reading has, in common with other places, suffered from drought. Annuals are dwarfer in growth than usual, but in most instances the plants are flowering profusely, and in some cases seeding prematurely. No rain, we were informed, had fallen practically for four months, and were it not for the strenuous attempts to counteract the effects of a prolonged drought, the results could not be other than disastrous. Judicious management, combined with good cultivation, such as has been recommended in these pages, curtailed the evil effects, however, to a great extent, and it is anticipated that there will be an excellent seed harvest, notwithstanding the deficiency of rain during the carly stages of growth. Much might be seen at Reading, there being always something of interest to note, and much could be recorded. Space, though, is limited, and we must confine our remarks for the present to the flowers that are now the most attractive at this world-famed establishment. Cleanliness and brightness pervade the whole premises, and smartness in attention to details relative to the production of the best possible seeds is most noticeable.

As is well known, every flower worthy of note, and that it is possible to grow from seed, receive attention at the extensive nurseries, and in the trial grounds of Messrs. Sutton, but none more so perhaps than Tuberous Begonias. These now form a special feature, and they are well worth a visit. It may be possible to see larger and more unwieldly blooms, but it is questionable whether from a decorative point of view more useful plants are forthcoming from any source. For neatness of habit combined with vigour and gracefulness we have never seen better plants, and the same may be said in regard to the flowers. These are not ungainly in size, as is too frequently the case, but large enough to display their beauty and symmetry. Of colours there is a great variety, and the shades of blossoms on plants produced from a packet of seed of the Reading Beauty strain are really surprising. Plants from seed sown six months ago are now a sight worth seeing, being from 12 to 15 inches in height and covered with blooms. One cannot help noticing the diversified habits of the plants; and although all present that healthiness and equilibrium that denotes careful fertilisation and judicious management, some are erect, with the flowers on stout stalks, standing well above the foliage, others are semi-erect, and not a few are of a drooping nature, possessing the gracefulness of a Fuchsia, and suitable for hanging baskets. For trade purposes the plants of the above-mentioned strain are arranged in sections under glass, and it may be interesting to note that the firm makes a speciality of offering seeds of the various colours separately. Numerous colours, from pure white to a deep crimson and the richest yellow with delicate tints of pink are also included in Sutton's prize strain; and the plants are also dwarf in habit with a robust constitution. No attempt is made to compile a long list of named varieties, the principal object kept in view being to grow seeds that can be relied upon to produce compact plants which will yield an abundance of flowers of an equal size and exquisite colouring. A new single white of exceptional merit, however, has recently been raised, and this is known as Queen of Whites. It is a beautiful variety, one of the best in cultivation, and always attracts attention. The plant is of good habit, and the flowers are pure white, large, and of great substance. In Reading Gem we have an interesting break from the ordinary type of Begonias. The flowers are of perfect form, and have white centres, which merge into a charming pink shade, the margin of the petals being a glowing carmine. It is one of the prettiest Begonias we have seen. a glowing carmine. It is one of the prettiest Begonias we have seen, and it will doubtless become a popular variety. Those who require blooms of a rich orange scarlet shade should make their acquaintance with Prince of Orange, whilst for producing bright orange coloured flowers Meteor will be found a most useful variety. The last-named kind has handsome dark foliage marked with light veins, which enhances its appearance considerably.

What has been said in regard to the single Begonias applies with equal force to the double varieties. The compactness of the plants and diversity of colouring in the flowers are equally noticeable in this section. Sutton's Double Mixed comprises blooms of the most superb forms and varied colours. Among them may be found flowers representing Camellias, Hollyhocks, Dahlias, Carnations and Roses, and in innumerable shades of yellow, rose, carmine, scarlet, and crimson, quite equal to, and in some cases surpassing, many named varieties. The Double White is a magnificent variety with pure white blossoms of superb form and substance produced well above a mass of sturdy robust foliage. Indeed, both single and double forms are unique; but to fully realise the quality of the strain the plants must be seen, and once seen they will be grown.

A new departure in Begonia culture has been made at Reading, and the result is that we now have a useful class of fibrous-rooted plants of the B. semperflorens section. These can be raised from seed as easily as the tuberous varieties, the plants usually flowering freely within a period of five or six months. From seed sown in January some plants a foot in height and loaded with flowers are to be observed here, but to ensure spring and early summer blooming a sowing may be made in August, and the seedlings grown steadily during the winter. A selection of these is being made, and the result is of a most satisfactory nature. Crimson Gem is one of the best, and quite an acquisition, the flowers being of a bright crimson shade. For bedding purposes as well as pot culture these Begonias are exceedingly useful, and in the open air the foliage assumes a bronzy metallic hue, which enhances their appearance. At the Gardens of the Royal Horticultural Society last year these Begonias were bedded out, and certificates awarded for several varieties; whilst at Reading this year they are most effective in the open air. Duchess of York is a new variety with rosy pink flowers, as also is Floral Gem. Snowflake is a charming white, and Duchess of Edinburgh is a beautiful form, with large white blossoms suffused with pink. It may be noted with advantage that these Begonias are robust, yet dwarf and well proportioned in habit, and will bloom long after the tuberous varieties are over; indeed if properly managed they will flower nearly all the year. The individual flowers, too, are twice as large as those of the ordinary semperflorens type, and are produced in great abundance. There is undoubtedly a future in store for these beautiful plants.

Achimenes also form a special feature at Reading, and several houses are devoted to their culture. For years experiments have been made and improvements effected by careful and patient fertilisation, and now the plants are perfect in habit, robust, and profuse in flowering. A great diversity of colours has also been obtained. Sutton's Blue is a good representative of one type, the flowers being of an intense shade. Rosy Queen is a splendid variety, especially attractive under artificial light. Splendens is a magnificent scarlet, a decided improvement on Dazzler. Harry Williams is a distinct variety and rather late in flowering, which renders it all the more valuable; and in Admiration we have a beautiful rosy purple flower. The whites are also specially good, the same applying to other varieties. Gloxinias raised from seed sown a few months ago are making a grand show, the plants being vigorous, carrying splendid foliage and flowers of great size and substance. The spotted kinds are charmingly coloured, and by a series of crosses an improvement in the habit of the plants has been effected, the foliage being more robust than was formerly the case. Of named varieties such as Her Majesty, Duke of York, Sutton's Scarlet and Purple are too well known to need a lengthy reference here, these having been exhibited at many leading exhibitions recently. A yellow Torenia deserves special mention, and the sight of a number of plants of Cyperus alternifolius raised from seed would interest many horticulturists.

Regarding the flowers in the open air the Asters first claim attention. Here we find a strain of the finest quality, and comprising flowers of the most charming colours. Many of the plants, however, will be at their best in about three weeks, but those who require an early flowering variety should grow Harbinger. This is a splendid Aster, growing 18 inches in height, and producing an enormous number of pure white flowers about a month before any other. The blooms of the variety Comet in various shades much resemble Japanese Chrysanthemums, and are general favourites for cutting, whilst for garden decoration Sutton's Bedding, Snowball, and Fire King are deserving of mention. The new dwarf Cannas raised from seeds sown this spring are blooming profusely in the open air, and for producing a grand effect in the flower garden these plants are indispensable. They should be grown in every garden. Carnations are particularly good, although, generally speaking, the season has been extraordinarily short, and it is satisfactory to observe that whilst layers and established plants have, owing to the prolonged drought, failed, the seedlings are flowering abundantly. The plants are vigorous in growth, forming dense tufts, and bear hundreds of richly coloured double flowers. The same may be said of the Picotees, which make a charming show. Stocks are everything that could be desired, showing a remarkable per-centage of double flowers, as also do the Petunias, which are wonderfully fine. A large breadth of seedling Hollyhocks afford ample evidence that considerable attention has been paid to the selection of Sutton's prize strain. The plants are dwarfer than is usual, being about 4 feet in height, doubtless owing to the dry weather, but the flowers are as double and as fine as those of the best named varieties. It is surprising how beautiful these Hollyhocks are when treated as annuals. Bedding Lobelias from seed are compact in habit and profuse in flowering, a vast improvement on the straggling seedlings of bygone days. The blue, white, and pink varieties are equally good, forming a strain which should be found in every garden. A specialty is also made of the trailing Lobelias in various colours, these being eminently adapted for vases and hanging baskets.

At the trial grounds the huge beds of annuals produce a brilliant display of colour. It is impossible to enumerate all the plants worthy of notice, but special mention may be made of a few exceptionally fine varieties. In this category we may place Crimson King Virginian Stock, a decided improvement on the type, and an excellent edging plant or for growing in beds. The double white Clarkias are extremely useful, and among Nasturtiums Aurora deserves special notice. This is a most beautiful flower of a primrose shade suffused with pink and carmine. Cloth of Gold, a yellow-leaved variety, is effective in a mass, and would make an excellent bedding plant. Of Calendulas Orange King is a grand double variety, and the French Marigold Miniature Spotted is very showy. Godetias in variety form pleasing masses of colour, Ladybird being a very dwarf form with white flowers spotted crimson. Apple Blossom is an exceedingly pretty Godetia with dense heads of white and pink flowers, and a dwarf form of Lady Albemarle is espe-

cially good. The last named variety is well adapted for bedding, the same remark applying to a selection of Duchess of Albany which has large pure white flowers. The Lupins appear to be flowering well this year, the various colours, comprising different shade of blue, lilac, white and yellow being most effective. Portulacas also form a pleasing feature, as likewise do the Poppies of numerous kinds. Great care is taken to keep the popular Shirley Poppy rich and varied in colouring, all "rogues" being promptly removed. Numerous other annuals, including the beautiful Nemesia Strumosa Suttoni, also receive attention; every possible effort to produce seed of the very best quality being made, and thus the reputation of the firm for excellence is fully maintained.—C.

THE WEATHER IN LONDON.—During the past week the weather has been changeable in the metropolis. Sunday opened fine but gusty. and rain fell heavily during the evening. Monday was showery and Tuesday proved fine, but it rained slightly on Wednesday morning. At the time of going to press it is fine.

ROYAL HORTICULTURAL SOCIETY'S GARDENS.—In the Gardens of the Royal Horticultural Society at Chiswick a very large collection of herbaceous Phloxes is now in full flower, and contains many beautiful varieties. Tuberous and hybrid Begonias grown in beds in the open are now coming into bloom. Violas, of which there is a very large collection, have done remarkably well, and are still laden with flowers. A house devoted to Fuchsias now presents a charming appearance. Cannas grown under glass form an interesting feature, and are doing well and very attractive. The Grapes in the conservatory and other houses are bearing, as usual, heavy crops of good fruit. Tomatoes are grown extensively, and commencing to ripen outdoors. All the best varieties are grown, and afford a good opportunity for observation to those interested in their culture.

DR. COOKE.—According to the "Kew Bulletin" Dr. Cooke, the well-known authority in mycology, has retired at the age of sixty-five from the public service. Dr. Cooke came to Kew when the collections, of which he has charge, were transferred from the Indian Museum to that establishment in 1880. It is gratifying to note that in recognition of his services the Secretary of State for India has made a small addition to Dr. Cooke's pension. Dr. Cooke has been succeeded at the Kew Herbarium by Mr. G. Massee, whose work on "British Fungt Flora" was reviewed in our last issue.

— FLORAL DESIGNS AT SHREWSBURY.—In consequence of the very early season for Carnations, and the certainty that there could be but little competition at Shrewsbury Show, August 23rd and 24th, the Committee have determined to withdraw the liberal prizes offered for collections, and instead to give £5 and a gold medal for the best display of floral arrangements in a space 10 feet by 4 feet, with second and third prizes added. The various objects to be exhibited in this class are left to the discretion of the exhibitor.

— AN EXHIBITION OF NARCISSI IN BIRMINGHAM.—The Council of the Birmingham Botanical Society has decided to hold an Exhibition of Narcissi in their Gardens at Edgbaston on Wednesday and Thursday, April 18th and 19th, 1894. An Exhibition was arranged to be held in April last, but the early season caused the Narcissi generally to be out of flower before the date fixed for the Exhibition, so that a good representative Exhibition did not take place; but it gave the Council every encouragement to hold another Exhibition next April.

— A FINE GLOXINIA.—"A. J. N." writes—"At the monthly meeting of the Chichester and District Gardeners' Mutual Improvement Society, June 26th, an extraordinary Gloxinia of Messrs. Sutton's strain was exhibited by Mr. W. Aylward, gardener to G. Woodbridge, Esq., Chichester. A first-class cultural certificate was awarded for the same. The plant was raised from seed two years ago, and carried fifty-four fully expanded flowers, which were of a good average size, and there were several buds to open. It was grown in a 7-inch pot, and was 32 inches in diameter. The leaves were from 9 to 14 inches long, and averaged 7 inches wide, and were of a bright and healthy colour. I saw in the conservatory of the gardens managed by Mr. W. Aylwa-d several Gloxinias similar to the one mentioned."

- —— DISTRICT SUPERINTENDENT OF LONDON PARKS.—We are informed that Mr. John Knight has been appointed District Superintendent of Parks and Open Spaces, north of the Thames, under the auspices of the London County Council.
- HORTICULTURE IN FRANCE has been recognised by the appointment of M. De la Devansaye as a Chevalier of the Legion of Honour. M. De la Devansaye, we understand, has been President of the Horticultural Society of Angiers for twenty years.
- LINCOLN'S INN GARDENS.—The gardens of Lincoln's Inn will, by permission of the benchers, be thrown open for the benefit of the poor children inhabiting the surrounding neighbourhoods. On and after August 14th, until September 15th, the gardens will be open from 5 o'clock until dusk.
- WATER EXCURSION.—A party of about ninety persons, chiefly employés at the Royal Nurseries, Slough, and friends, had a very pleasant trip up the Thames last week. The party embarked about nine o'clock in the steam launch "Emperor," and the beautiful river bank scenery was greatly enjoyed.
- NEW ZEALAND APPLES IN LONDON.—Shippers of Apples from Auckland are, says a New Zealand paper to hand, in receipt of returns for fruit shipped to London. Although the prices realised have not in every case been satisfactory, a large amount of useful information has been gleaned as to the future prospects of the trade, which goes to show that there is money in the trade when it is carried out on the best lines.
- SEFTON PARK GARDENERS' ASSOCIATION. Under the patronage of the Lord Mayor and of the ex-Mayor, Mr. J. de Bels Adam, the members of the Sefton Park, Wavertree, and District Amateur Gardeners' Association will hold their annual flower Show on Saturday, August 12th, and Monday, August 14th, in the enclosed grounds of the old Fern Lawn Tennis Club, Smithdown Road, opposite the Sefton Park entrance. Arrangements have been made for exhibits in fifty-three classes, with three prizes for each class.
- —— LAMBETH FLOWER SHOW. The annual Lambeth Flower Show was held in Lambeth Palace Grounds recently. In spite of the dryness of the season during the last few months a large number of flowers were exhibited, and they all gave evidence of knowledge, care, and attention. The flowers displayed in marquees were not the only attraction. During the day a programme of athletic sports was carried through, there was an old English fair, and at night a display of fireworks. Canon Pelham presided at the distribution of prizes by Mrs. Stanley, who was accompanied by Mr. H. M. Stanley, the African explorer.
- Market Apples.—In the deep sandy soil at Ham Common Mr. Walker, who has a number of remarkably fine Apple trees from four to six years planted, has very largely reduced his stock of Lord Suffield, and is replacing it with Lord Grosvenor, which is found to be more robust and on the whole a more reliable cropper. Then, too, such a popular variety as Warner's King does not do well on the sand, and is being replaced by Bismarck. However, the six favourite kitchen varieties here are Lord Grosvenor, Grenadier, Stirling Castle, Peter the Great, Prince Albert, and New Hawthornden. This is also for all ordinary purposes a selection hard to beat as bush trees. Of dessert varieties for market purposes Gladstone, Worcester Pearmain, Yellow Ingestrie, and Cox's Orange Pippin are in high favour; so also is Duchess of Oldenburg, a really good market Apple.—A. D.
- FLOWERS AT EASTBOURNE.—The recent rains have had a most beneficial effect at Eastbourne, as elsewhere, and the flower beds on the Grand Parade are now arrayed in all their glory. They present a brilliant yet harmonious mass of bloom, and daily visitors may be seen admiring them. Eastbournians, says a Sussex paper, are proud of their gardens on the Front, and with good reason, for they are certainly an additional attraction to an already picturesque promenade. Mr. Smith, the Corporation's head gardener, invariably manages to produce some novel device in laying out the beds. Examples of his skill in this respect may be found opposite Victoria Place and Wilmington Square. The latter exhibits the sentiment of loyalty and congratulation so appropriate to the present season. On scrolls of red in yellow letters are the following words:—" Eastbourne's best wishes for our sailor Prince, G.F.E.A.," "Deus est qui regit omnia," "Long life and happiness to their Royal Highnesses the Duke and Duchess of York." In the centre is a representation of the Royal Standard, 7 feet square, and at the eastern end a crown.

- ENGLISH GARDENERS FOR INDIA.—An Indian paper states that the Government of India have under consideration a scheme by which European gardeners for gardens in the various provinces will be regularly supplied from Kew, and will be retained on conditions more satisfactory than at present.
- LADY GARDENERS.—A daily contemporary is responsible for the following statement:—"Lady Carlisle is training an entire staff of women gardeners, who she hopes will keep the grounds of her Yorkshire home in as perfect a condition as their male predecessors have done." If there is any truth in this assertion it is surely the latest development of the craze for lady gardeners.
- Australian Fruit.—During the past year or so fruit from the irrigation colonies in Australia has been noticeable on our markets. Canned Peaches and Apricots are exhibited by Messrs. Chaffey Brothers at the Earl's Court Exhibition, at the Imperial Institute, and the Crystal Palace. It is stated that a consignment of 4000 cases of Oranges and Lemons from Australia will shortly arrive.
- —— BUDDLEIA GLOBOSA IN KIRKCUDBRIGHTSHIRE.—Mr. S. Arnott writes:—This fine shrub was lately in full flower in Mrs. Maxwell-Witham's garden at Kirkconnell. A plant grown on a south wall receives a little protection in winter, some Spruce branches being placed over it; but one on a south border has for the last four years had no protection, and is in no way injured. I should like to know how far north this Buddleia is found to be hardy.—S. ARNOTT.
- Mangroves and Their Effect on the Coast Line.—In his interesting report to the Colonial Office on the scientific results of the Anglo-French Delimitation Commission which he accompanied to Sierra Leone, Mr. Scott Elliot states that the effect of the Mangroves in creating alluvial soil could be very clearly seen at Mahela and in the Samu country generally. Mangrove trees seem in fact, he says, to have been designed by Nature to change any bay or indentation of the coast line into fertile soil.
- —— DEATH OF MR. J. PITHERS.—Chrysanthemum growers will hear with great regret of the death of Mr. J. Pithers, which took place at Chilwell early yesterday (Wednesday) morning. He had been head grower to Messrs. J. R. Pearson & Sons for the past few years, and only those who have had an opportunity of seeing their magnificent collection in November can realise the full excellence of his work for the great midland firm. His capacity as a Chrysanthemum grower had been previously proved, for he was a well-known exhibitor and prizewinner when practising in the south of London years ago. Mr. Pithers had an exceptional knowledge of the Autumn Queen and energetically supplemented the efforts of his employers to keep their collection up to date in every respect.
- Hook Cottage Garden Society.—Representing the Surrey County Council Technical Education Committee, Mr. A. Dean, in conjunction with Mr. Weddell and Mr. Cox, Secretary to the local Society, visited the parish allotments on Thursday afternoon and awarded prizes for the best. There are a large number on land which belonged to the late Mr. Blake, the rental being 1s. per rod. Naturally, the "Surrey Comet" asserts, Mr. Blake's death has caused some anxiety as to the future occupation of the land as allotments. Several cottage gardens were also visited and prizes awarded. In the evening, under the presidency of Mr. W. B. Clode, an address on "Gardening in Relation to Allotments and Cottages" was delivered by Mr. Dean at the schools to a considerable audience, which was listened to with the greatest interest.
- HORTICULTURAL EDUCATION.—At the post-prandial proceedings in connection with the annual outing of the Devon and Exeter Gardeners' Association some excellent suggestions were thrown out by the Chairman, Mr. Hope, and others, whereby the value of the Society as an educational institution would be enhanced, and the interests of an important industry be promoted. One of the suggestions, remarks an Exeter evening paper, was that the younger members should take an increased interest in the practical work of the Society, and thus fit themselves the better to meet the growing competition with the English markets which was everywhere manifest. It is doubtless a great slight upon farmers and gardeners that they should allow millions of Apples to be sent from the other side of the globe, when they could be produced at home with perfect ease, and sold at prices which would be thoroughly remunerative. This, of course, is but a very small phase of the foreign competition question, and is a subject which might properly occupy the attention of everyone interested in horticulture.

THE "KEW BULLETIN."—Copies of the "Kew Bulletin" for April and May, also for June, are to hand, and these contain much useful information. In the number for the first two months there is an interesting account of "Botanical Enterprize in 1796," which is well worth perusal. Instructive articles on the "Chinese white wax" and "Manila aloe fibre," with miscellaneous notes are also included in that number. The issue for June is equally interesting, and in addition to various articles contains many miscellaneous notes from which we extract the half-dozen that follow this paragraph.

—— MALAYAN PLANTS.—Dr. G. King, F.R.S., has sent from Calcutta a collection of between two and three hundred new or rare Malayan plants, and a set of 270 specimens of the late Father Scortechini's Perak Ferns. These Ferns were worked out by Colonel Beddome, and published in the "Journal of Botany," in 1887. Mr. Charles Curtis, Assistant Superintendent, Forest Department, Penang, who is an excellent collector, has also forwarded a further set of 220 species of Malayan plants.

—— PLANTS FROM JAPAN.—Through Dr. Kingo Miyabe, Kew has received from the Agricultural College of Sapporo, Japan, the first part of a set of the plants of the Island of Yeso. It contains 237 pieces, and includes the orders Ranunculaceæ to Rosaceæ. And through Professor Matsumura Jinzo, Director of the Botanic Garden, Imperial University, Tokio, the Herbarium has been enriched by a collection of some 1350 species, including many not previously represented at Kew. This collection is valuable, apart from its numerical extent, inasmuch as it contains authentic specimens of novelties published by Professor M. Jinzo himself.

— MEXICAN PLANTS.—Kew has purchased a set of Mr. C. G. Pringle's Mexican Plants, collected in 1892, and also the first three centuries of Mr. L. D. Reed's Virginian plants. Both of these gentlemen are excellent collectors, and Mr. Pringle's Mexican plants include novelties from the apparently inexhaustible Mexican flora. Dr. A. Engler, the Director of the Berlin Botanic Garden, has presented a parcel of about 100 species of Brazilian Melastomaceæ, many of them authenticated types of new species.

—— Bulbs from Asia Minor.—Mr. E. Whittall, a merchant of Smyrna, and an ardent lover of plants, has considerably enriched the Kew collection of bulbous plants. He is collecting systematically, and the results promise to be very successful. Already several new things contributed to the herbarium have come to light, amongst them Galanthus Icarisiæ, Tulipa concinnea, and Fritillaria Whittallii.

—— NEW LILIACEÆ FROM TROPICAL AFRICA.—In Engler's "Jahrbucher," vol. xv., pp. 467-479, is a paper by Dr. Engler and Mr. J. G. Baker on the new Liliaceæ discovered by recent German collectors in Tropical Africa. It includes an lphigenia, a bulbine with flat leaves, an Anthericum of the sub-genus Phalangium, five species of Chlorophytum, one Eriospermum, an Aloe, four Albucæ, one Urginea, two Drimiæ, five Scillæ of the sub-genus Ledebouria, and six new Dracænæ, one of which is figured. This latter, which is named D. Braunii after its discoverer, has been brought from the Cameroons to the Berlin Botanic Garden, where it flowered in August, 1891. It has very short flowering stems, with only a single pair of leaves, overtopped by the much longer leafy sterile stems. The new Aloe (A. venenosa, Engler) was found by Dr. Pogge on the Kaissai, one of the feeders of the Congo in the very centre of the continent, and is used as an arrow poison.

- ACIDANTHERA ÆQUINOCTIALIS, Baker .- Through Mr. Scott Elliott, Kew has received full specimens, with corms for cultivation, of this plant collected on the top of Sugar-loaf Mountain, Sierra Leone, where Mr. Scott Elliot found it on his recent expedition as botanist to the Anglo-French Delimitation Commission. It was only known previously by a sketch of the inflorescence and flowers made by Dean Herbert, now in the Lindley Library, a copy of which was made several years ago by Mrs. Thiselton Dycr for the Kew collection of drawings. The corm is large and globose, with tunics of parallel fibres. The plant reaches a height of 4 fect, and the stem bears a large number of strongly veined ensiform leaves, the lowest of which is 1½ foot long, and nearly an inch broad. The tube of the perianth is 5 or 6 inches long, the longest that is known in the whole order Irideæ. The species much resembles the Abyssinian A. unicolor and A. bicolor of Hochstetter, but is much larger in size. The locality where the plant was seen by Mr. Scott Elliot is 3000 feet above sea-level. The whole collection brought home contains altogether 1500 species.

—— MARK SMITH, LIMITED.—Just as we are preparing for press a request reaches us to announce the amalgamation of the firms of Messrs. Mark Smith & Co., Louth, and the Horticultural and Agricultural Chemical Company, Glasgow. The above will be the title of the weed killing company in future, with the head quarters at Louth, Lincolnshire.

JUBILEE OF THE ROTHAMSTED EXPERIMENTS. - The arrangements are now completed for the celebration of the Jubilee of the Rothamsted agricultural experiments at the Laboratory, Harpenden Common, on Saturday, the 29th inst., at 3 P.M., under the presidency of Mr. Herbert Gardner, M.P., President of the Board of Agriculture. The proceedings, we learn from Nature, will commence with the dedication by Mr. Gardner of a granite memorial, erected in front of the Rothamsted Laboratory, to commemorate the occasion. Addresses of congratulation will then be presented to Sir John Lawes and Dr. Gilbert on behalf of the subscribers to the Rothamsted Jubilee Fund and various learned societies, including the Royal, Royal Agricultural, Chemical, Linnean, and other leading scientific institutions. Sir John Lawes will also be presented with his portrait, which has been painted by Mr. Hubert Herkomer, R.A., for the subscribers to the Jubilee Fund. Afterwards there will be a reception at Rothamsted by Lady Lawes. The Rothamsted Laboratory, where the ceremony will take place, adjoins Harpenden Common, and is distant about half a mile from the Harpenden station of the Midland Railway Company.

ROYAL HORTICULTURAL SOCIETY.

JULY 25TH.

THE holiday season had set its mark on the meeting on the above date, the exhibits showing a considerable falling off in numbers and the attendance being very small. However, there was a fair show of flowers and fruit and a good sprinkling of Orchids.

FRUIT COMMITTEE.—Present: T. Francis Rivers, Esq. (in the chair); the Rev. W. Wilks, Messrs. G. Bunyard, J. Cheal, William Warren, H. J. Pearson, A. Dean, G. Woodward, W. H. Divers, G. Wythes, G. Reynolds, F. Q. Lane, H. Balderson, and J. Smith.

Fruit made an attractive display. Messrs. G. Bunyard & Co., Maidstone, Kent, sent a large collection of Apples and Pears, comprising some thirty dishes. The Apples were clean, of a good size, and well coloured, especially Red Juneating, Duchess of Oldenburg, Gladstone, Beauty of Bath, Red Astrachan, Lady Sudeley, and Quarrenden. Other varieties especially good were Stirling Castle, Early Transparent, Grenadier, Sugarloaf, Peter the Great, and Gold Medal. Some fruits of Pear The Beacon were fine and well coloured. The same firm staged fruits of the yellow and red Mirabelle Plums and some Apricots. A silver Knightian medal was recommended.

Messrs. T. Rivers & Sons, Sawbridgeworth, sent a grand collection of Apples, Apricots, Cherries, Nectarines, Plums, and Pears grown in a cool orchard house; Ribston Pippin Apples were very fine and well coloured, and Louise Bonne of Jersey, and Souvenir du Congrès Pears looked delicious. Lord Napier and Dryden Nectarines were exceedingly good, being richly coloured, and the same may be said of Monarch and Late and Early Transparent Gage Plums. The Cherries were Bigarreau Noir de Gueben, Emperor Francis, and Géant d'Hedelfinger; the Apricots being Grosse Pêche and Mexico (silver Knightian medal). Mr. W. H. Divers, gardener to J. S. Hopwood, Esq., Ketton Hall, Stamford, sent a box of remarkably fine Dagmar and Crimson Galande Peaches and Lord Napier Nectarines. The Peaches were exceedingly good and reflected credit on the grower (cultural commendation). Mr. O. Thomas, Royal Gardens, Windsor, staged a grand Smooth Cayenne Pinc, cut from "a rootless sucker planted on September 15th, 1892." The fruit weighed 5 lbs. 12 ozs. (cultural commendation). Mr. Thomas also sent a bunch of white Grapes for naming, and four baskets of Apricots, comprising Moorpark, Frogmore, Shipley's, and Powell's Late.

Mr. Woodward, Barham Court Gardens, Maidstone, staged fruits of Alexander Peach grown on an east wall, and some fine Lord Napier Nectarines gathered from a standard tree in an unheated house (cultural commendation). A dish of 1892 Apples came from Col. E. Smith, Threescombe House, Stroud (gardener, Mr. E. Jackson), but the fruit was small and uninviting compared with those of this year, sent by Mr. Bunyard. Mr. T. W. Rich sent fruits of a seedling culinary Apple, said to be very early. They were medium-sized and well coloured on one side, but no award was made. A. H. Smee, Esq., The Grange, Wallington (gardener, Mr. G. W. Cummins), had a dish of a fine early Apple, the name of which was not determined; and Lord Foley, Ruxley Lodge, Esher (gardener, Mr. Miller), some well grown fruits of Royal George, Noblesse, Grosse Mignonne, and Alexander Peaches (cultural commendation). Mr. Laxton, Bedford, showed coloured plates of his new Strawberry Royal Sovereign.

Mr. G. Wythes, gardener to the Duke of Northumberland, Syon House, Brentford, staged seventeen fruits of Beauty of Syon Melon, six boxes of Apricots, and four boxes of Morello Cherries (silver Banksian medal). Mr. J. Smith, Mentmore Gardens, Leighton Buzzard, had half a dozen dishes of Apricots, including fine fruits of Moorpark and Hemskirk (vote of thanks). Nine dishes of Apricots were also sent from the Society's Garden at Chiswick, the best fruits being Shipley's Early,

Kaisha, Moorpark, and Turkey. Seedling Melons were sent by Mr. F. Lee, Lynford Hall, Norfolk, and Mr. J. Rodbourne, Haling Park Gardens, Croydon. An award of merit was adjudged for Melon Lee's Perfection, which is a good flavoured white-fleshed variety. Messrs. Cooper, Denison & Walkden, 7, Bride Street, E.C., sent some "Handy" fruit baskets. These are made of tough Manilla paper, and with the wire handles attached are convenient for small fruits (commended).

A large collection of Tomatoes, comprising thirty-four dishes, came from the Society's Gardens at Chiswick. The best red varieties were Perfection, Long-keeper, Chemin, Seedling Macgregor, Horsford's Prelude, and the yellow varieties were well represented by Peach Yellow, Blenheim Orange, Golden Queen, Golden Gem, and Golden Nugget. Mr. J. May, gardener to S. G. Lutwyche, Esq., Oakfield, Eden Park, Beckenham, sent a box of splendidly grown fruits of Perfection Tomato (cultural commendation). Mr. G. M'Dougall, Ravenna Cottage, Stirling, sent some fruits of a fine seedling Tomato named Ravenna, for which a rate of Abraham and a seedling Tomato named Ravenna, which a vote of thanks was accorded.

FLORAL COMMITTEE. — W. Marshall, Esq. (in the chair); Rev. H. H. D'Ombrain, Messrs. C. T. Druery, H. B. May, H. Herbst, David W. Thomson, R. Dean, G. Stevens, C. F. Bause, C. J. Salter, H. Cannell, J. D. Pawle, W. Bennett Pöe, C. E. Shea, C. E. Pearson, T. Baines, O. Thomas, T. W. Girdlestone, and G. Gordon.

Maggra F. D. Shuttleweeth & Go. Albert Nurspring Packborn Prospect

Messrs. E. D. Shuttleworth & Co., Albert Nurseries, Peckham Rye, sent a collection of plants, among which Crotons Hawkeri, Lady Zetland, Earl of Derby, Queen Victoria, Princess of Waldeck; Ferns, Caladiums, Dracænas, Liliums, and Hydrangeas were most conspicuous (silver Banksian medal). Messrs. J. Laing & Sons, Forest Hill, staged a group of miscellaneous plants. Amongst these were Palms, Tuberous Begonias, Caladiums, and the pretty Saxifraga sarmentosa tricolor superba (silver Flora medal). An award of merit was adjudged for Caladium Le Nain Rouge, which is described below. Mrs. Darwin, The Grove, Huntingdon Road, Cambridge, sent a Tuberous Begonia named Mrs. Bourne, which attracted attention. An award of merit was adjudged tor this variety, which is described elsewhere.

Messrs. H. Cannell & Sons sent a very beautiful collection of double

tuberous Begonias interspersed with Ferns, the plants having been raised from seed in February. The invaluable Octavie formed a line at the from seed in February. The invaluable Octavie formed a line at the back. The varieties displayed great quality in respect to size and colour (a silver Banksian medal was recommended). Messrs. J. Veitch and Sons sent Retinospora squarrosa sulphurea, Cupressus Lawsoniana versicolor, four Gladioli × Lemoinei varieties, a charming basket of single dwarf French Marigolds, the beautiful pale yellow Rhododcndron Sylvia, Lantana Drap d'Or, Carnation Celia, and Didymocarpus lacunosa (botanical certificate). H. E. Domaille, Esq., La Colombelle, Guernsey, sent a Carnation named La Villette, a yellow ground Fancy. Mr. P. McArthur, Maida Vale, had a small collection of Ferns, foliage plants, and Orchids (bronze Banksian medal). Mr. F. Ræmer, Quedlinburg, Germany, had the variegated Hop Humulus japonica variegatus. Carnations came from 1. de Bunsen, Esq., Mrs. Wickham, and Mr. F. Bull, Colchester. The latter received an award of merit for Esmeralda.

(See below)

Mr. H. Eckford, Wem, Salop, sent a fine collection of Sweet Peas, for which a silver Banksian medal was recommended. These were fresh and highly coloured, the best being Novelty, Firefly, Senator, Mrs. Gladstone, Lady Penzance, Emily Eckford (fine blue), Eliza Eckford, and The Belle. Awards of merit were adjudged the two last named which are described elsewhere. Messrs. G. Paul & Sons, The Old Nurseries, Cheshunt, sent a collection of hardy flowers, a dark flowered Clematis of the Viticella type named "Kermesana," and a beautiful Campanula Mariesi, for which a first-class certificate was awarded. This is described elsewhere. Mr. W. H. Divers, Ketton Hall, Stamford, sent a splendid collection of cut Carnations, tastefully arranged in bunches on moss with their own foliage. Bunches of Ketton Rose were much admired in this contribution. Other good varieties were Duchess of Portland, Winter Cheer, Mead's Crimson, and Rose of Rutland (bronze Banksian medal). Mr. Anthony Waterer secured a first-class certificate for Spiræa Anthony Waterer, which is mentioned elsewhere.

ORCHID COMMITTEE.—Present: H. J. Veitch, Esq. (in the chair); Dr. Masters, Messrs. J. O'Bricn, H. Ballantine, T. W. Bond, T. Statter, E. Hill, H. M. Pollett, and A. H. Smee.

The Orchids were not very numerous, but there were a few for the specialists to find pleasure in. Messrs. Sander & Co. had a small but very pleasing group flanked by the new foliage plant Strobilanthes Dyerianus. The Orchids included Cypripedium Massaiana (superciliare × Rothschildianum), the first hybrid yet flowered from the latter; C. Fausianum (Dauthieri × calophyllum superbum), C. hybridum Youngianum, Zygopetalum (Promenæa) xanthina, Mormodes pardinum, Aërides Sanderiana. Cattleya Gaskelliana. C. granulosa, and Dendrobium Aërides Sanderiana, Cattleya Gaskelliana, C. granulosa, and Dendrobium transparens (silver Banksian medal). Messrs. Pitcher & Manda sent a pale form of Sobralia macrantha named Princess May. The sepals and petals were nearly white, the lip a faint blush, and the throat lemontinted. They also had Cypripedium Edwardi, which is described below. Messrs. B. S. Williams & Son had a group of considerable beauty, fringed and interspersed with Ferns. It included Platychinis filiforme, Anguloa Ruckeri sanguinea, Cypripedium robusticum, C. Swanianum, C. superbum Demidoff's variety, Paphinia cristata grandis, and Pescatorea Dayana. A silver Banksian medal was recommended.

T. Statter, Esq., Stand Hall, Manchester, sent several interesting plants, such as Lælia elegans superbiens, L. prasiata, Cattleya Rex, C. crispa superba (see below), Vanda lamalata, Cattleya Rex Stand Hall variety (cultural commendation), and Lælia Amesiana. Mr. H. Denison, gardener to T. A. Gledstanes, Esq., Manor House, Gunnersbury, received a cultural commendation for Cattleya superba splendens. Mr. Billington, gardener to W. R. Lee, Esq., Audenshaw, Manchester, sent Cattleya Gaskelliana Audenshaw variety (a fine form). Mr. Salter, gardener to T. B. Haywood, Esq., Woodhatch Lodge, Reigate, contributed Miltonia vexillaria Daisy Haywood, which received a first-class certificate and is described below. H. Tate, jun., Esq., Allerton, Liverpool, had Cypripedium Tryonianum (Harrisianum x superbiens, Demidoff's variety), and Cattleya Hardyana, Tate's variety (see below). Messrs. W. L. Lewis & Co. were represented by Cattleya Dowiana variety Lewisiana, and C. gigas Turnbulliana.

CERTIFICATES AND AWARDS OF MERIT.

Begonia Mrs. Bourne (Mrs. Darwin).—This is a curious break in Tuberous Begonias. It is a vigorous growing variety with yellow flowers, the petals of which have crimped edges, the sepals being

partially transformed into leaves (award of merit).

Caladium Le Nain Rouge (J. Laing & Sons).—A dwarf-growing variety with small red leaves flushed with green. For decorative

purposes it will be very useful (award of merit).

Campanula Mariesi (G. Paul & Son).—This is a charming Campanula of a dwarf habit of growth. A pan of it was shown, and the plants were from 3 to 6 inches in height. The flowers are about 3 inches in diameter, and of a brilliant blue shade (first-class) certificate).

Cattleya Hardyana, Tate's variety (H. Tate, jun., Esq.).—A very fine form, of great size, and rich in colour, the lip being particularly prominent. The colour is rich maroon crimson with yellow side lobes

(award of merit).

Carnation Esmeralda (Mr. F. Bull).—A yellow ground with slate-coloured flakes, very distinct (award of merit).

Cupressus macroearpa lutea (Dicksons, Limited).—A very beautiful variety, the foliage being of a very distinct lurid yellowish green colour

(first-class certificate).

Cypripedium Edwardi (Pitcher & Manda).—A cross between C. Farrieanum and C. Veitchi. The petals are the chief feature of the flower; they are blunt and drooping, with greenish-white lines of chocolate dots and fringed with hairs of the same colour; dorsal sepal greenish white with chocolate lines and flushed with rose towards the edge (award of merit).

Lælia erispa superba (T. Statter, Esq.).—A very fine form, a most profuse bloomer, judging by the specimens, and with large flowers. Sepals and petals pure white, lip rich purple (first-class certificate).

Melon. Lee's Perfection (F. Lee, Esq.)—This is a large, handsome white flesh, fruit sweet and juicy and of good flavour (award of merit).

Miltonia vexillaria Daisy Haywood (T. B. Haywood, Esq.).—A magnificent variety, flowers of great size and pure white, save for the central patch of yellow (first-class certificate).

Spiræa Anthony Waterer (Anthony Waterer).—This is a dwarf-growing form of S. Bumalda, and the heads of bloom are deep crimson

(first-class certificate).

Sweet Pea Eliza Eckford.—A beautiful and distinct variety, with white flowers tinted and flushed pink (award of merit).

Sweet Pea The Belle (H. Eckford).—A charming variety, with blush flowers heavily flushed with rosy pink (award of merit).

ALPINE HOUSES AND PLANTS.

AT the Drill Hall on Tuesday afternoon Mr. H. Selfe Leonard read an admirable essay on the above subject, Mr. Geo. Paul occupying the chair. The attendance was not very large, but it was evident that all were deeply interested in what was said by the essayist, who, it need

scarcely be said, dealt with his subject in a masterly manner.

Mr. Selfe Leonard, at the opening, pointed out that in his paper only true Alpine plants would be referred to, and not such as had been popularly called so, through their dwarf-growing habit and adaptability for planting in rock gardens, but having no right whatever to the name, which was only truly applicable to such plants as really grow on moun. tains in the temperate regions. From many years' personal and close study of Alpine plants the essayist had found that some artificial protection was essential to real success, such protection to be supplementary to the rock garden. It was not frost which was to be feared, for this, in the essayist's opinion, was practically harmless to the very large majority of such plants which were grown in this country; it was the cold rains of the autumn and the cutting winds of the spring months which played such havoc amongst the more tender plants under notice.

To demonstrate this reference was made to the well known Alpine species of Primulas, first-rate collections of which were, he said, far too seldom seen. For protecting these plants many contrivances were called to the aid of growers, but that contrivances were called to the aid of growers, but that most generally used was the ordinary garden light which, though excellent in its way, had one serious disadvantage, for while keeping the tops of the plants dry it allowed them in rainy weather to become sodden at the roots, through the water constantly dripping off the sides and front. Frames were also largely used, but these were very difficult to adequately ventilate, a point of the utmost importance when the protection of Alpine plants was under consideration. A house specially constructed for the purpose was recommended. In erecting such houses the primary consideration was to provide an abundance of fresh air. The houses which he had found to give the most satisfaction were built with wooden sides and ends, almost flat entirely removeable roofs, with a stage running down each side under which were shutters which, except

in very foggy weather, were kept always open. The houses were low and the stages built up fairly close to the glass, as the plants were not adapted for placing on low stages at a distance from the roof. Such houses were built north and south and shaded by means of a wash being

put on the glass with the aid of a brush.

Shade was necessary for some plants—as, for example, the Ramondias, which, when found growing in their native habitats, were always shaded. As a further shading, and when the lights were, as was frequently the case, entirely removed, he had canvas made to stretch the length of the house, and this he had found very necessary during such intensely hot weather as had been experienced during the past months. The inside arrangements of such houses was purely a matter of taste, some preferring to have the plants placed in a bed on the stages, and others, of whom he was one, rather leaning towards keeping them in pots, as the plants were more easily replaced when their beauty was on the wane; and besides, the soil which was known to be most suited to a

are depicted in the engraving, and these attracted some attention. The bloom is medium-sized, white, covered with bright crimson spots. The leaves are deep green, and about 3 inches in length.

In reference to your article on a "New Lilium" in your issue of the 20th, kindly allow us to state that we believe that our exhibit was entered before that of Messrs. J. Veitch & Sons, and that the first-class certificate was awarded to each, no distinction being made as stated in your article. The naming of the Lilium was left to Mr. Baker. We have written to the Royal Horticultural Society to confirm our views, the matter being considered at their meeting. We consider you should have illustrated the Lily as L. Alexandræ, which name has now been confirmed by Mr. Baker. We are afraid that we shall not be

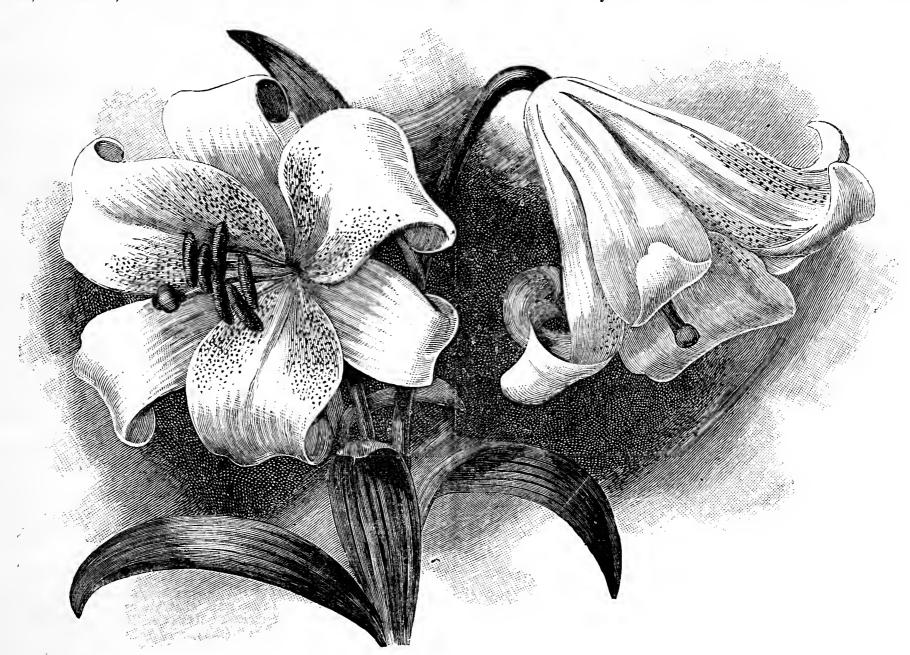

Fig. 13.—LILIUM LOWI.

plant could be much more readily accorded. Under the stages a rockery could be formed, and such, when tastefully and skilfully arranged,

undoubtedly much enhanced the beauty of the house.

In erecting the house in the rock garden the existing formation should receive consideration in order that the house might be placed in such a position as not to become at any time unsightly, but rather be an interesting and an additional charm. In ventilating houses of Alpine plants near towns and where fogs were at all prevalent it was, said the essayist, advisable that all the air admitted should be filtered through wire gauze, which prevented much smoke and soot from finding a resting place on the occupants of the house.

After a short discussion a hearty vote of thanks was accorded to Mr. Leonard for his paper, and the meeting closed.

NEW LILIUMS.

A PLANT of Lilium Lowi, which is shown in the illustration (fig. 13), was exhibited by Messrs. Hugh Low & Co., Clapton, at the Exhibition held on July 11th in the Gardens of the Royal Horticultural Society, Chiswick. It is a very distinct and pretty Lily, and a first-class certificate was awarded for it. The plant staged was about 3 feet in height, and growing in a 5-inch pot. It bore two flowers such as

able to forward you the letter from the R.H.S. in time for this week's issue, but trust you will put the matter right.—Wallace & Co.

[We stated that "a first-class certificate was awarded in each case." Our artist sketched the flower of Messrs. Veitch's plant, and we naturally associated the name under which it was exhibited with the illustration. We also indicated that the correct name had still to be determined. Mr. Baker now gives it as Lilium japonicum var. Alexandræ.]

BACTERIAL DISEASE IN TOMATOES.

MR. LOCK (page 49) has been rightly informed. I am far from being a stranger to the disease, if disease it is, to which he alludes, but have so wholesome a dread of the staying towers of Mr. G. Abbey that I would rather not cross swords with him just yet. When I have thoroughly convinced myself, and am therefore in a position to convince others, that Mr. Abbey has mistaken effect for cause, then, and not till then, do I intend to enter fully into the subject. To all appearances there is no necessity for either Mr. Lock or other wholesale growers to alarm themselves as to the work of any known bacteria among either Tomatoes or Cucumbers.

If my advice is taken, Mr. Lock, and others who are equally

interested, will not again invite a failure in one way in their attempts to stear clear of another. Poverty of soil and insufficiency of moisture have much to answer for this season. Why does Mr. Lock agree that animal manure should be avoided, when, according to his own showing, a use of it has been attended with the best of results? I am of opinion that we have been too sparing of solid manure, especially this year, chemical or special manures being but poor reeds to lean upon in tropical weather.—W. IGGULDEN.

SCARLET RUNNER BEANS NOT SETTING.

I SHALL be glad to know the cause of Scarlet Runner Beans not setting. I have never known them behave in the way they are now doing. I called on my next neighbour (a market grower) to inquire about his, and I found them just like my own. He tells me the complaint is pretty general in this neighbourhood. I am well aware that Beans fail to set if they are dry at the root, but in my case and also that of my neighbour they have not been so. I was not a little surprised to find that they did not respond to the waterings, as I have always been able to procure Beans with the aid of the water-pot in dry weather. I am even more surprised now, as for the past fortnight we have had copious rain. I observe that humble bees are scarce hereabout this season, and that the blossoms of Beans are not pierced by them as is usual. Is the proboscis of the humble bee necessary to effect the "pollination" of Beans as is the case with some Clovers? Hive bees do not work at Scarlet Runners much. Information will be very acceptable.—T. S., Bristol.

[We shall be glad to hear what correspondents have to say on the subject.]

SILENE PENDULA.

The great beauty and effectiveness of this well-known plant when employed in masses for spring bedding is invariably commented upon by all who sec it in full flower. There is, however, one objection frequently advanced against its general use for the above purpose—viz., the comparatively late period at which it flowers, this in many cases preventing the planting of the summer occupants of the beds filled with the Silene at the usual time. There is a great amount of truth in this objection, but it is one which may to some extent be overcome by sowing the seed early, and planting the young plants in their permanent quarters some time during the following October. The usual time recommended for sowing is early in August. This answers fairly well should the weather during the following two months prove favourable for promoting rapid growth, and if early autumn frosts are not prevalent; but under conditions the reverse of these the plants do not become strong and well rooted in time for early planting. This operation is in consequence delayed till late in the autumn or early in the spring, the result in either case being that their flowering period is unnecessarily delayed. In order to avoid this undesirable state of affairs seed should be sown at once in a sunny position.

I generally sow thinly in drills 9 inches apart. When the plants are large enough to handle they are pricked in beds, allowing 4 inches of space between each plant, and should the weather prove dry they are kept well watered till established. The only after-treatment necessary to secure good plants by October is to eradicate all weeds in a young state, and occasionally stir the surface of the soil with a small hoe. Well-rooted plants with good balls of earth attached are thus obtained, which, having been grown sturdily from the first, are able to withstand the frost of severe winters, and with the advent of warm spring weather start at once into growth, and begin to flower as early as the climatic conditions of each locality and season render

possible.—H. DUNKIN.

CHATSWORTH.

Whether Chatsworth under the Chester régime differs much or little from the Chatsworth of Speed and Thomas must be left for decision to those whose visits are not, like my own, limited to the first figure of the numerical system, but who have seen it under its various chiefs. Probably so vast a place, of which the working arrangements must necessarily be in the hands of permanent departmental foremen, changes little year by year, but as to that I can say nothing. My reference to the great Cavendish demesne must be limited to a few impressions made while its famous gardens rest under the charge of Mr. Chester, and as a result of a road journey thither in the midst of the terrific heat of late June in the present year of grace. To refer to it at all seems to be repeating an oft-told tale, but "other times, other manners," other minds, other thoughts, and perchance some fresh ground may be broken as the result of a pleasant summer ramble through some of the loveliest scenery in England—from smoky Sheffield to beautiful Baslow and Edensor.

It was my misfortune to arrive at Chatsworth a few minutes after some friends had taken the head gardener under their protecting wings and carried him away. I had had a foretaste of this sort of thing in Sheffield the day before, when I struggled through the sweltering heat up to Rough Bank in search of Ben Simonite, found that he had moved farther afield up Attercliffe way; sought him there, and at length discovered his garden only to learn that the worthy old florist was out in the town somewhere. A second edition of this within a few hours was too much, but there was no help for it. I was too late. But fortune

did not altogether desert me. The plant foreman, Mr. G. Ridout, came to the rescue, and proved to be a capable and entertaining guide. He has been at Chatsworth more years than some young ladies would own to having existed, loves it well, and knows its every feature and charm. Herewith, at the outset, I gratefully acknowledge his able and patient guidance.

IN THE BOSOM OF THE HILLS.

There are many approaches to Chatsworth, but it is difficult to imagine one more beautiful than that from Sheffield, which takes the traveller by Fox Houses and Froggatt Edge to Baslow and the Derwent Valley. The road goes upward for many tedious and dusty miles from the cutlery metropolis, winding gradually into cloudland, and then there comes the turning point—the point where the peaks tower up around and look on the green depths far below. The road winds round the side of the hills, downward now, downward for mile after mile through the bosom of the hills, with the grim rocks above and the smiling valley beneath. The former hang sheer over the road in some places, but there are no waters to loosen their hold or masses of snow to bring them crashing down. The peaks glide by onc by one in majestic array. To an eye that has not rested on the gleaming Silberhorn or the sublime Jungfrau they must be of absorbing interest, and the temptation to turn in the saddle and gaze on each giant as it recedes into the rear is too strong to be resisted, even when flying at breathless speed down the winding hillside, with the dizzy slope down to the valley but a few feet away. It is a picture not often seen, not soon to be forgotten. What dreary grandeur there must be in it in the winter time, when the fierce winds sweep through the valleys and the tors are robed in their winding sheets. But that is in the past and in the future, not in the sunlit, gilded present. Now the great hills smile, and their magnificence retains all its hold upon the mind when at length Baslow, nestling in the valley, is reached, the Derwent crossed, and Chatsworth close at hand.

IS CHATSWORTH BEAUTIFUL?

I ask the question in all seriousness, and with a reason. In a book from which I shall presently quote there are references which might lead to the belief that the pride of Derbyshire is but a poor apology for a beautiful domain—cockneyfied, artificial, and commonplace. We who have read of it chiefly from the gardening point of view have surely formed no such opinion as that. Have gardening writers, therefore, given us misleading impressions? Is the reputation that it enjoys, as one of the fairest spots of our "isle inviolate," false? Should we no longer look upon it, as we have done for all these years, as one of the foremost places in the land? Fresh indeed would be the ground broken if I were to study Chatsworth from such a standpoint, and, setting at defiance all established ideas of its beauty and greatness, proceed to show that it is vulgar and inartistic. But no such task is mine. I call attention to such a view publicly expressed with the object of showing, as I hope, that it is inaccurate and untenable. Let us read:—

A CRITICISM AND A DEFENCE.

"If," says Baddeley's "Guide to the Peak District" in its reference to the Chatsworth Gardens, "we once admit that Art does not outstep its province in entering into direct competition with Nature in Nature's own department, that there is nothing impertinent in the cockney pleasantry that a beautiful landscape is almost equal to the transformation scene in a pantomime, we may derive unmixed pleasure from the Chatsworth Gardens." One may be forgiven if he pauses and rubs his eyes over such words as these. Even while admiring the cleverness of their construction, no one can fail to recognise that a tremendous indictment is being levelled at the place of which a description is being indictment is being levelled at the place of which a description is being given, and naturally seeks to ascertain what has prompted them. But before proceeding to that the writer tells us that Nature is gracious and kind. "In some parts of them" (the gardens), he goes on to say, "Art has almost become a second Nature, so forgiving a spirit has the latter manifested in overgrowing hand-built rockeries with her own green livery." And then we learn what is the head and front of the offending. There is a long cascade in the grounds near the house—a made cascade, a cascade such as that in the grounds of the Crystal Palace, with broad stages of stone, each a yard or so below the other, so that the water when "on" may go plunging down, making a series of miniature falls. This grievous thing appears to have had a large share in exercisfalls. This grievous thing appears to have had a large share in exercising the soul of the Guide writer, and the evil work was furthered by a tree of copper, so cunningly contrived that the turning of a tap in a quiet corner near causes water to gush from its stems, and squirt around on unwary visitors like a Californian "sprinkler" on a bed of Radishes. Well, the tree is an absurd fancy of course, and the cascade artificial and indefensible; but admitting both, what is to be said of the person to whose mind these things constitute the gardens of Chatsworth? Vain, it would seem, are the thousands of magnificent Conifers, rearing their tall spires to the clouds, the flower bordered lakes, the huge, the gorgeous masses of Rhododendrons clothing the hillsides, the banks of wild Roses, the Fern-filled dells. All that makes what to visitors who know and love beautiful gardens is a dream and a delight must be blotted out to lcave room for a paltry satire, founded chiefly on a stone cascade and a copper tree! To absurdity so sublime, to ignorance so colossal, as arc evidenced in the description of Chatsworth Gardens from which I have quoted, it would surely be futile to suggest that these are but weak fragments of a great, a powerful, a magnificent whole.

THE VICTORIA HOUSE.

Were it only for the Victoria house, Chatsworth would be well worth a visit. There is something in its very originality which strikes one,

and its breadth and boldness of treatment fit the place. Older and more travelled horticulturists than myself have perhaps met its counterpart, but to me it had all the charm and delight of something that is at once strikingly beautiful and entirely fresh. The greater part of it is occupied by the central basin, and in the middle of that was a plant of the famed Victoria regia with half a dozen leaves 6 feet across. It had started from a small plant put out in April, about two months before I saw it. This will give an idea of the rapidity of its growth. It was not in bloom, but other beautiful aquatics were. The lovely Nymphæa Devoniana, with its bronzy leaves and brilliant carmine flowers, and the pale bluc N. Daubenyana, were two of the most beautiful, but the ivory-hued N. dentata, and the pale lemon odorata sulphurea, with its rich orange centre, were also greatly admired. Wheels turned by the water flowing from taps above them keep the whole volume in motion. Coleuses, large and small, splendidly coloured, line the top of the wall, but immeasurably the most striking objects in the house, apart from the Victoria, are the superb baskets of Achimenes suspended in the air, as may be seen on reference to the engraving fig. 14. The largest are 4 feet high and the same through, living masses of the richest colours. Nelumbium speciosum is largely represented in one of the side basins. The plants trained up the sides are not passed by without admiration. Gloriosa superba is in such condition as to richly merit its name. Thunbergias are producing showers of blossom, and a less familiar plant in Stigmaphyllon ciliatum exhibits rare beauty.

THE FRUIT HOUSES.

These, like the Victoria house and several plant structures, are in the kitchen garden, which is some distance from the mansion and its grounds. A grand house of Pines, in which Queen and Smooth Cayenne are largely represented, is sufficient evidence that these noble but tortoise-like fruits have not been abandoned, as is the case in so many places. Cucumbers are grown on an enormous scale, and the last of the batches of forced Strawberries, which collectively would number from 2000 to 3000, was seen. Amongst the vineries is an old structure on the ridge and furrow system built in Sir Joseph Paxton's time. The Vines, which are planted outside, still yield good bunches. There are four houses of Frankenthal alone, which was the late Duke's favourite Grape, and in his preference for it he displayed, as in so many other things, good sense and taste. That the Vines have sound material on which to feed, and good management to enable them to make the most of it, is proved by a house of Hamburghs four years old and another of Foster's Seedling three years old. Both have splendid foliage, and the latter in particular have made wonderful growth. There is a grand crop of Muscats in another large house. The Peach houses are, for the most part, very wide structures. One old flue-heated house 40 yards long was once filled with a single tree. They are full of fruit, the trees being models of good training, health, cleanliness, and cropping. It would be almost invidious to single out any varieties for special mention, but Goshawk and Royal George deserve it. Figs are splendidly grown, and so are Melons. There is a house of young plants of the latter, such as is very rarely to be met with. Hero of Lockinge, Wm. Tillery, Blenheim Orange, Read's Scarlet Flesh, and The Countess are all largely represented.

THE PLANT HOUSES.

What may be termed the show houses for plants are in the grounds near the mansion, but the nursery is in the kitchen garden. A thousand Chrysanthemums are here grown for cut flowers, and double Primulas are also in strong force. Streptocarpuses of the excellent Veitchian strain are turned to a good use, being grown in 3-inch pots and employed as edgings. With a pinch of Clay's fertiliser now and then by way of a stimulant they flower beautifully. I was much struck with a Justiceous plant, Crossandra infundibuliformis, which I had not previously seen. It has large double flowers bearing a strong likeness to those of a Zinnia, salmon in colour, and lanceolate leaves. It had been in bloom for two months at the time of my call, and is unquestionably a very useful plant worth growing in many other places. The Chatsworth foreman spoke highly of it. I must pass over the other plants in the nursery department to say a word or two about those near the house. There is an excellent collection of Orchids, the Vandas in particular being extremely fine, quite reminding one of the magnificent plants of Messrs. B. S. Williams & Son, and Mr. Measures of Camberwell, which is as high praise as could be given. There are also some splendid pieces of the beautiful Thunia Marshalli, and a very fine collection of Calanthes, Cypripediums, and Cattleyas. Angræcum eburncum, too, is well represented. A good assortment of Heaths provides a source of interest to lovers of hardwooded plants. It would be impossible to refer individually to all the plants that are well grown, but Eucharises call for a special reference, as do Tubcroses, which are splendidly flowered in 4-inch pots. Of table plants there is a grand collection. The Camellia house, with its huge plants, 20 feet high, must be a wonderful sight when its giants are smothered with flowers. What is termed the Portland Walk is a beautiful promenade by the side of a lofty wall covered with a glass case. It must be quite 150 yards long, and the whole of the wall is covered with climbers

THE GREAT CONSERVATORY.

The critical Guide writer's description of the conservatory can hardly be called comprehensive, but it is decidedly quaint. "It is," he says, "nearly 300 feet long, 120 feet wide, and 60 feet high. In it the rarest

exotics, from the Fan Palm, gaunt and heavy topped, to the Maidenhair Fern, the most beautiful thing in the building, find a congenial home. There is one Cactus-like plant—the American Aloe—which is fabled to take 100 years to flower, and then to die." That is all. This lucid description is interesting from the information given as to the dimensions of the great structure. It is truly a wonderful building, but as it is now undergoing complete repair I did not see it at its best. It contains a remarkable collection of plants, amongst them being the blue Adamia cyanea, huge Cinnamons, Theophrasta imperialis, with its fine broad leaf; Inga pulcherrima, a Sensitive Plant; Cibotium princeps 25 feet high, Heritiera macrophylla, Begonia fuchsiodes 20 feet high, Dasylirion acrotrichum 9 feet high, growing luxuriantly close to a pool; grand pieces of Platycerium alcicorne, Bamboos, Yuccas, a splendid collection of Cacti, including some beautiful seedlings; Corypha australis 65 feet high, the top of which has been through the roof; C. umbellifera, 60 feet; Encephalartos Kaffira (the Kaffir Palm), of

FIG. 14.—A BASKET OF ACHIMENES.

which there are two noble plants; Monstera deliciosa fruiting well; Renanthera coccinea 18 feet high, and with four spikes of its rich red flowers; and a gigantic Seaforthia clegans 60 feet high in seed. Other objects of admiration are the basket Ferns, the many beautiful pools, the almost precipitous walls of stones and Ferns, the cases of Filmies, the Bananas (from one of which a 72 lb. cluster has been cut), and the Tree Fern stems spangled over with the beautiful berries of Nertera depressa, which spread over the moss that covers the stem when planted and now produce a beautiful effect.

THE FLOWER AND WILD GARDENS.

I need only make a passing reference to the Italian or west front garden near the mansion, with its conspicuous masses of pink China Roses and golden Yews, or to the French garden near the Portland Walk, with its Moss Roses, Pinks, Violas, and other flowers, but the grounds and wild garden call for fuller notice. From the lake, with its famous fountain, which when in full swing uses 1000 gallons of water a minute, grand views can be obtained. The surrounding country presents a beautiful picture, the white waters of the Weir flash in the sunlight, and Edensor Church may be seen nestling among the trees. Splendid Beeches dot the rising ground near the conservatory, and wild Roses clothe the banks. At one point there is a precipitous wall 40 feet high, from the face of which near the summit water gushes, Moss and Ivy mantling the stones. Paths wind up to higher ground, where huge breadths of Rhododendrons flourish. Sheffielders tell me that in spring they make

pilgrimages to sec the wondrous sight when the broad masses are in bloom, and that their beauty is indescribable. I can well believe it, for my mind recalls the extraordinary picture in the late Mr. McIntosh's garden at Weybridge, where there could not have been a third of the plants which clothe the hillsides at Chatsworth. Beautiful salmon-coloured masses of Ghent Azaleas also arrest attention, and here and there a pause has to be made to admire a noble Conifer. A splendid Pinus nobilis 60 feet high overhangs a lake, and not far away are a grand pair of Abies orientalis 30 to 40 feet high. A wonderful specimen of A. Douglasi, which had an altitude of nearly 70 feet, has unfortunately been torn by the wind. A. Nordmanniana. 30 feet high, is very beautiful in the tender hue of its young growths. Cryptomeria japonica is splendidly represented, as are Araucarias, Firs, Larches, and Austrian Pines. The lake referred to with its dotting of yellow Irises and border of Willow Herbs and yellow Broom is a beautiful picture.

In the trees, shrubs and flowers, in the banks, glades and dells, there is a diversity of beauty and interest which no pen could describe. It is not a tree, but a thousand trees, not rods, but acres of wild garden and woodland with their countless numbers of shrubs, ferns and flowers which have to be seen before the mind can form a conception of the beauties and glories of Chatsworth. My pleasure in the visit was shared by hundreds of excursionists from Sheffield, Manchester, and other places, and I am told there is a similar influx every day. I turn from an imperfectly fulfilled task with the sense that this noble place must exercise powerful influences for good in opening up conceptions of the beautiful to thousands of toilers to whom the joys of gardening are, from circumstances beyond their control, forbidden.—W. P. W.

HORTICULTURAL SHOWS.

TRENTHAM.—JULY 20TH.

WHEN it is considered that the annual exhibitions held in the Ducal Grounds of Trentham are the outcome of the local Cottage Garden Society we are forcibly reminded of the truth of the axiom that "Great results from little causes spring." The first attempt at extension, a very few years ago, was prompted by a desire to provide more attractive features than a cottagers' show could afford, and the results have exceeded the most sanguine anticipations. But while the general exhibitions of high class produce in the form of the artistic arrangements of plants, great displays of Roses and other cut flowers, and superior fruit have attained national fame, the original object of the society has not been lost sight of, and the greatest number of classes are still to be found in the amateurs' and cottagers' portion of the schedule. Moreover, the prizes offered in these classes considerably exceed the average value of the majority that are provided in shows of this nature. This is very satisfactory, and it is also gratifying to observe that the competition in these classes increases and improves from year to year. The society is therefore accomplishing the object it was established to promote—better tilled gardens and more attractive home surroundings in the district.

GROUPS OF PLANTS.

With that reference to what may be termed the foundation of the Show, we pass to the general exhibits as being of wide general interest. It may be premised that no prizes are offered for large specimen plants at Trentham, but instead special attention is devoted to groups. For these the prizes offered exceed those in a similar class at any show in the kingdom, and as a consequence the competition is the best that can be produced. Perhaps nothing could better indicate the superiority of the groups that were arranged last week than the fact of the formidable Mr. Cypher being placed in the third position, and surely never before did such a beautiful arrangement fail to win a higher place. Still, the prize was not small. The first prize provided in this 300 feet space arrangement was £20 with a "special," value £10 10s., added; second prize, £20; third, £13; fourth, £9; or a total of no less than £70 10s. in this one class. That is the way to secure the highest competition, and the groups arranged were worth a long journey to see.

The fortunate winners of those prizes were the Duke of St. Albans (gardener, Mr. J. Edmonds), first; J. H. Manners Sutton, Esq. (gardener, Mr. Webb), second; Mr. Cypher third; and C. H. Wright, Esq. (gardener, Mr. Roberts), fourth. The character of the groups may be briefly referred to, anything like a detailed description of them being out of the question. The space appeared to have been set out in squares. Mr. Edmonds occupied his with a magnificent Kentia as a central plant, elevated on a mound of Ferns, from which sprung, with telling effect, noble scarlet heads of Hæmanthus. There were some eight or nine smaller mounds, in some of which single-stemmed, well grown, and highly coloured Crotons commanded attention; in others were graceful Palms, and in one a beautiful plant of Dracæna indivisa variegata. At the base of these elevated plants were Ferns interspersed with flowers, such as Begonias, a few Orchids, and Francoas, but this was lightly done, while Caladium argyrites and variegated Grasses were placed here and there in the miniature dells between the elevations. Richness, with freedom, was the prevailing characteristic of the group; but if it had a fault it was just a little overdone, but still a beautiful arrangement, or it would not have won its high position at the hands of such Judges as Messrs. Bruce Findlay, F. Sander, and John Wills.

Mr. Webb's arrangement was similar in character, and he ran his rival closely. He formed a bold mound right in the foreground, surmounted by a noble Palm, and had smaller mounds near the corners occupied with handsome foliage plants, including splendid Crotons;

scarlet Anthuriums, and other flowers, associated with Ferns, Panicums, and Caladiums, enlivened the group, which was undoubtedly a good one, but the background perhaps a little weak. Mr. Webb must be regarded as a formidable competitor in classes of this nature.

Mr. Cypher's group was wholly different. It was composed of a clear groundwork of moss with a large central and smaller front mounds of Orchids arranged round a Palm in each case. There was plenty of space between the mounds, in which a pair of Tiger Lilies were effective: but the group was undoubtedly weakened by small patches of blue Lobelias, and the linking of the front mounds by a formal chain of Caladium argyrites did not strengthen the arrangement. The background was composed of Hydrangea paniculata, Crotons, and slender Bamboos—too light for the position, and not a sufficient foil to the plants in the foreground. Formalism is a cardinal fault in arranging plants for effect in the eyes of most experienced judges.

Mr. Roberts' group in the class under notice was similar in style to the first and second prize arrangements, but rather too many plants were employed, and the leading features did not stand out so clearly as is desirable, though the group was superior to many that have won first honours at many shows. In the local group class the chief prize was won by J. P. Maddock, Esq. (Mr. G. H. Smith, gardener), a background of well grown specimen plants, with a free undulated arrangement in front—and altogether a creditable display. The whole of the groups made a show in themselves of great attractiveness to the crowds of visitors.

FRUIT AND VEGETABLES.

Not less important and meritorious was the display of fruit, and nothing approaching it in extent and quality had been seen at any show of the season. The prizes were good—£10, £6, and £3 being offered for nine dishes, and £6, £3, and £2 for six dishes, also similar amounts for four bunches of Grapes, while sufficient inducements were provided to bring plenty of entries in the smaller classes. The numbers show this clearly, and the list is worth giving. In the nine dish class there were seven entries; for six dishes, nine; for four bunches of Grapes, fourteen; for three bunches of Black Hamburghs, twenty-one; for three of any other black Grape, seventeen; for three Muscats, eleven; for three of any other white Grape, sixteen; for a green flesh Melon, twenty; scarlet flesh, seventeen; Peaches and Nectarines, fourteen each; and Cherries, ten entries. A sufficient foundation it will be admitted for a fine show, and a fine show it was, though, of course, all the fruit brought was not staged, and the Committee will have to consider the desirability of providing more prizes in these classes.

In the large class for nine dishes, including three bunches each of black and white Grapes, a Melon, and a Pine, Mr. J. McIndoe, The Gardens, Hutton Hall, was first with a splendid collection, fine Muscat and good Gros Maroc Grapes, excellent Bellegarde Peaches, Humboldt Nectarines, Negro Largo Figs, Souvenir du Congrès Pears, and a fine cluster of well ripened Bananas. This collection was also granted a valuable pedestal and vase offered for the "most meritorious exhibit in the Show," and Mr. McIndoe went home happy. Mr. J. Goodacre was second in this class, his Black Hamburgh Grapes and Elruge Nectarines being very good indeed. Mr. Dawes, Temple Newsam, third with well-grown produce.

In the class for six dishes Mr. G. Reynolds, Gunnersbury Park, had the honour of placing Mr. McIndoe in the second position, sufficient proof that Messrs. Rothschild's fruit was of high merit. The Muscat and Black Hamburgh Grapes were particularly good, and a fine Melon had much weight. Mr. Edmonds followed, but not far distant, with excellent fruit.

Mr. Crawford, gardener to J. Grant Morris, Esq., secured the premier position with four bunches of Grapes in two distinct kinds with superior examples of Madresfield Court and Black Hamburghs. Mr. Alsopp, gardener to Lord Hotham, was a close second with finely finished Muscats and Buckland Sweetwater; third, Mr. J. Wilkes, gardener to Mrs. Meaken, Cresswell Hall, the Hamburghs being finely finished. For three bunches of Black Hamburghs the prizes went in order to Mr. J. G. Morris, Mr. J. Roberts (Gunnersbury), and Rev. Bulkeley Owen, all staging admirable examples of culture. In the any other black class, Mr. A. G. Young (Tanybryn, North Wales) well won the first place with Mr. A. G. Young (Tanybryn, North Wales) well won the first place with grand full bunches of Muscat Hamburghs (also awarded a special for the best three bunches of Grapes in the Show), Mr. Grant Morris second, and Mr. J. Edmonds third, both with Madresfield Court in admirable condition. In the Muscat class Mr. Alsopp was clearly first, Mr. N. C. Curyan second, and Mr. J. Hudson third. Both bunches and berries were very good in this class, but the date evidently too early for general high finish. In the any other white class Mr. Alsopp again took the lead with remarkably fine Buckland Sweetwater. Mr. Banner. took the lead with remarkably fine Buckland Sweetwater, Mr. Bannerman following with good Duke of Buccleuch, Lord Carnarvon's gardener being third with Bucklands. The special prizes offered by Messrs. W. Innes & Co. for three bunches of any variety grown with "Fertilitas" were won first by Mr. W. Elphinstone, Shipley Hall Gardens, with noble specimens of Cannon Hall. Second, the Earl of Shrewsbury, with Madresfield Court; third, N. C. Curzon, Esq, with Black Hamburghs. It may be added that Mr. Elphinstone cut thirty similar bunches of Cannon Hall at the same time from one Vine with three rods-a noteworthy achievement, if not unparalleled, in a gentleman's garden. Mr. Miller Mundy should be proud of his Vine. The display of Grapes in the above classes was magnificent, and dozens of exhibits not in the charmed circle would have been well within it at most shows held during the present year.

In the green fleshed Melon class Mr. Gcodacre was first with the

Countess, and Mr. Wilkes was first in the scarlet flesh class. The names of the other prizewinning varieties could not be obtained. The best Peaches were shown by Mr. Gilman, Violette Hâtive, and the best Nectarines from Bretly Park. Further details not procurable in the crowded tent, and a mere list of prizewinners without varieties is of small interest.

ROSES AND SPECIAL EXHIBITS.

Mr. Wilkins, gardener to Lady Theodore Guest, was the most successful exhibitor of vegetables for Messrs. Taylor's, Sutton's, and Webb's prizes, one of his collections winning the medal for the best example of good culture in the Show. Mr. J. Waite closely followed in most

of the classes with excellent produce.

Roses were undoubtedly the centre of attraction in the cut-flower department, and considering the season the display was remarkable. In the class for forty-eight blooms, distinct, Messrs. Harkness were first with A. K. Williams, Earl of Dufferin, Mrs. John Laing, Madame Hausman, A. Rigotard, Marie Baumann, Madame E. Verdier, Chas. Lefebvre, J. S. Mill, Ulrich Brunner, Fisher Holmes, Exposition de Brie, Horace Vernet, Eclair, Madame Chas. Crapelet, Duchess of Bedford, Edouard Andre, and Countess of Rosebery as the leading blooms. H. Merryweather second with very bright blooms, those most noteworthy being Ulrich Brunner, Sir G. Wolseley, F. Holmes, Thomas Mills, Gloire de Margottin, Pierre Notting, Her Majesty, Souvenir d'Elise,

Horace Vernet. Messrs. R. Mack & Sons, Catterick, third.

With thirty-six distinct blooms Messrs. Harkness were again first, winning the National Rose Society's gold medal. Best varietics.—Mrs. J. Laing, A. K. Williams, Gustave Piganeau, Charles Lefebvre, Marie Rady, Duchesse de Morny, Alfred Colomb, Etienne Levet, Senateur Vaisse, J. S. Mill, Duke of Edinburgh, Madame Hausmann, Horace Vernet, S. M. Rhodocanachi, Louis Van Houtte, The Bride, Earl of Dufferin, Duke of Teck, E. Hausberg, and E. Y. Teas. Messrs. Jas. Cocker & Sons, Aberdeen, second, Her Majesty, Caroline Kuster, A. Soupert, Mrs. J. Laing, Comtesse de Nadaillac, and Margaret Dickson being very good. Third Messrs. Mack & Sons. Twenty-four distinct, three blooms each, first Messrs. Harkness & Sons, the best triplets being Alfred Colomb, Mrs. John Laing, Duke of Edinburgh, H. Vernet, Queen of Queens, Harrison Weir, Fisher Holmes, Pride of Waltham, Prince Arthur, A. K. Williams, Ulrich Brunner, Chas. Lefebvre, Countess of Rosebery. Second Mr. H. Merryweather, the best blooms being Gustave Piganeau, A. K. Williams, Mrs. John Laing, Catherine Mermet, La France, Ulrich Brunner. Third Messrs. Mack & Sons.

In the class for twelve single dark velvety Roses Mr. H. Frettingham, Beeston, was first with Pierre Notting, Messrs. Harkness second with Reynolds Hole, and Messrs. D. & W. Croll, Dundee, with Prince Arthur. Not a good class. Twelve blooms light Roses (much better), first Messrs. D. & W. Croll, second Messrs. Harkness, third Messrs. Perkins and Sons, Coventry, all staging Mrs. John Laing. Twelve Roses, any colour, first Messrs. Harkness, Alfred Colomb, fine; second Messrs. Croll, M. Baumann, good; third Messrs. Mack & Sons, A. K. Williams.

Eighteen Teas and Noisettes, first Messrs. Cocker & Sons, Aberdeen, with Princess of Wales, F. Kruger, Rubens, Ethel Brownlow, Madame Hole, Souvenir d'un Ami, Madame Lambard, The Bride, Comtesse de Nadaillac, S. A. Prince, Cleopatra, Souvenir d'Elise, Madame Cusin, Madame Bravy, and Innocente Pirola. Second Messrs. Croll, Dundee. Third Mr. Merryweather. Twelve distinct Teas or Noisettes, three blooms each, first Messrs. Cocker & Sons, Aberdeen, with Rubens, Cleopatra, S. A. Prince, The Bride, Hon. E. Gifford, Madame Lambard, very good. Second Messrs. Harkness & Sons. Third Messrs. Croll.

Other cut flowers in competition must perforce be passed with the remark that Messrs. Jenkinson & Sons, Newcastle, Staffordshire, exhibited splendid bouquets, defeating Messrs. Perkins in all the classes

—a notable feat.

Silver medals were awarded for special exhibits—namely, Messrs. Birkenhead, Cutbush, Laing & Mather, Dobbie & Sons, Hewitt & Co., Smith (Worcester) and Edmunds (Nottingham) for their specialties. A bronze medal was awarded to Messrs. Pearson & Sons, Chilwell, for a richly coloured Gloxinia, and a first class certificate and silver Banksian medal to Messrs. F. Sander & Co. for their distinct new plant with large blue tinted leaves, Strobilanthus Dyerianus.

We are glad to learn that though several thousands of persons, by kind permission of the Duke of Sutherland, passed through the Trentham grounds not the slightest damage was done to anything. Improvements are visible everywhere. The Duchess, as is well known, is a great lover of flowers, and the gardens of Trentham may be expected to become

still more famed for their interest and beauty.

PRESCOT.—JULY 20TH.

THE ninth annual Exhibition of the Prescot Horticultural Society was held on Thursday in Knowsley Park. Charming weather prevailed, and there were close upon 200 entries more than last year. A most effective circular group of plants was arranged by Mr. J. Bounds, gardener to A. L. Jones, Esq., Oaklands, Aigburth, and this exhibitor was awarded first prize; the second prize went to Mr. R. Pinnington, gardener to Mrs. Banner, Blacklow House, Roby. The leading prize for a group 60 square feet, went to Mr. H. McFall, gardener to E. C. Leventon, Esq., Oakfield, Roby.

Esq., Oakfield, Roby.

For six stove and greenhouse plants there was a close run between Messrs. Bounds and Pinnington, the Judges deciding in favour of the former. For Fuchsias, and Zonal Geraniums, Mr. Leith, gardener to Mrs. Ihler, staged wonderful examples, the Ivy-leaved Geraniums being 7 feet high, and the Fuchsias were not formally trained, although 9 feet high. The prize for six stove and greenhouse Ferns went to Mr. R. Pinnington for

fine specimens. Double and single Begonias were admirable, both prizes being taken by Mr. J. Humphreys, gardener to E. S. Eccles, Esq., The Orchard, Huyton. The prizes for Gloxinias, Cockscombs, and Liliums went to Messrs. Learmont, McFall, and T. Eaton, gardener to J. Parrington, Esq., Roby Mount. For Petunias and Coleus Mr. W. Gibbs, gardener to G. T. Cripper, Esq., Roby, was successful. Roses call for little comment. James Berry, Esq., Prescot, took honours for eighteen, and was second in twelve, the first being taken by Mr. W. Wharton, gardener to J. Royston, Esq., The Orchard, Huyton. In classes for Pansies, collections of cut flowers outdoors, double and single Dahlias, bouquets, six Roses in pots, and model garden, the following were successful—Messrs. Pownall, Eaton, Humphreys, Bounds, and Donnelly.

Fruit was well shown, Mr. W. Oldham, gardener to J. Beecham, Esq., Ewanville, Huyton, taking first for four dishes of fruit, with Buckland Sweetwater and Black Hamburgh Grapes, Gros Mignonne Peaches, and Scarlet Premier Melons, Mr. Eaton and Mr. Pinnington being excellent second and third. The prizes for two bunches Black Hamburgh, two any other black, and dish of Nectarines went to Mr. J. Barker, gardener to J. W. Raynes, Esq., Rock Ferry, for perfect samples of Madresfield Court and Pineapple. For two bunches of Muscats, and two bunches of any other white, Mr. E. Blythian, gardener to Mrs. Baxter, The Towers, Rainhill, was a good first, Mr. Oldham being second. For Melons, Peaches, Cherries, Black, Red, and White Currants, Raspberries, Gooseberries, and Apples, the following secured the awards—Messrs. Ferguson, Eaton, Tyrer, W. A. Allan, Barker, Gibbs, Cook, Aindow, Hughes, and Bounds. Vegetables were grandly shown, the first for collection of twelve varieties being taken by Mr. J. Case, whilst Mr. R. Pinnington took that offered by Mr. H. Middlehurst, seedsman, Manchester Street, Liverpool. Mr. Jno. Young, the President, and Mr. Robert Rigby, the courteous Secretary, and Committee are worthy of every commendation for the hard work they performed.

HUYTON AND ROBY.

The first Exhibition of this newly formed Society was held last week in a field adjoining the new Local Board offices, and more than realised the expectations of the Committee and visitors alike. Over £80 had been offered in prizes for groups fruit, plants, and vegetables, besides a fine silver challenge cup to be won two years in succession, or three times in all, for twenty-four cut Roses in eighteen varieties, and which was presented by the Vice-President, W. H. Crook, Esq., Huyton. There were also special prizes for original paintings of flowers, epergnes, and bouquets. Of the quality of the exhibits there was not a fault to be found. Space will not permit of a full account of the exhibits. Mr. R. Pinnington, gardener to Mrs. Banner, Blacklow House, Roby, took first prizes for six stove and greenhouse plants, six stove and greenhouse Ferns, two Palms, Peaches, and Nectarines, and four dishes of Potatoes; second for one Orchid, a greenhouse plant in bloom, three Coleus, collection of four dishes of fruit, and six stove and greenhouse cut flowers.

Mr. Eaton, gardener to John Parrington, Esq., Roby Mount, secured prizes for four dishes of fruit, single greenhouse Fern, two bunches Black Hamburgh Grapes, and second for Liliums, Begonias, Peaches and Nectarines. Mr. W. Lyon, gardener to A. M. Smith, Esq., Bolton Hey, Roby, gained awards for one Orchid, six stove and greenhouse cut flowers, a very pretty group 7 feet in diameter, and for table plants. Mr. McFall, gardener to E. C. Leventen, Esq., Oakfield, Roby, also was awarded prizes for eight varieties of vegetables, six table plants, two Palms, and four stove and greenhouse plants. Mr. Rattray, gardener to G. G. Musson, Esq., the President of the Show, won with Begonias, and was second for a group of plants and for the twenty-four Roses; the challenge cup being won by Mr. W. Wharton, gardener to J. Royston, Esq., Huyton, with a good collection well arranged.

The prizes for an epergne went to Miss Crook, with a charming arrangement of Iceland Poppies and light Grasses; whilst for the painting Miss Maggie Fishwick, The Orchard, Huyton, had a charming upright panel of Irises and Lilium candidum; Miss Kate Harding, Rydal House, Huyton, being granted an award of merit for a beautiful painting representing a wickerwork basket filled with Bourbon Roses, with blue china vase in background. Nurserymen made a splendid exhibit. Messrs. Middlehurst with herbaceous cut flowers and Gladiolus; Ker & Sons, Aigburth, with new and rare plants; and C. A. Young, F.R.H.S., West Derby, for Carnations and Picotees.—R. P. R.

BEDFORD.—July 20th.

Under most unfortunate circumstances has this Show been held during the last five consecutive years, rain falling each year during the greater part of the day. Thursday last proved no exception to the proverbial wet Bedford Flower Show day, rain commencing by seven o'clock with a most leaden sky, and old prophets predicted a wet day. Fortunately, however, by eleven o'clock things brightened, and the sun appeared to gladden the hearts of Secretary and Committee, who have been working a practically insolvent concern. With a band contest as an extra draw things promised to go off better than could have been expected earlier in the day, and the afternoon and evening holding fine, although threatening, enough money was taken to pay expenses.

Reverting to the Show proper, all were agreed that considering the remarkable season and the lateness of the Show for Roses and herbaceous flowers, it was a very creditable one indeed. The exhibits were good, although not in such great numbers as in former years. In the open class for Roses, forty-eight distinct, Messrs. G. & W. H. Burch, Peterborough, proved the victors in a class of five competitors with clean and

bright, although small, blooms. Mcssrs. D. Prior & Sons proved a close sccond, Messrs. Paul & Son, Cheshunt, third. In the open eighteen Teas, Dr. Budd, Bath, was first; D. Prior & Son, Colchester, second; Rev. W. H. Jackson, Stagsden, Bedford, third. In amateur classes, for twentyfour Roses, distinct, open, Dr. Budd was again to the front, with Mr. E. B. Lindsell second, and Mr. J. Parker, Hitchin, third. In the class for twelve Teas and Noisettes, distinct, Dr. Budd was first, Rev. Jackson, Stagsden Vicarage, Bedford, a good second, and Mr. J. Parker third. For twelve Roses, distinct, Miss E. Druton, Stevenage, was first, Mr. G. Moules, Hitchin, second, and Mr. W. O. Times, Hitchin, third.

In the open class for thirty-six hardy herbaceous there were two very strong exhibits, Messrs. Paul & Son, Cheshunt, first, Laxton Bros. Bedford, a close second. In the class, Messrs. Sutton's prizes for the best collection of vegetables, open to amateurs and gardeners, Mr. Empson, The Gardens, Ampthill House, was first with a good stand, Mr. G. Woodhams second, and Mr. G. Robinson, gardener to F. Howard, Esq., third. The exhibits in the amateur and gentlemen's gardeners' classes in most cases were very creditable indeed, and although there was in some classes but one exhibit, the Judges, owing to the quality, in most cases awarded first prizes.

The cottagers' class was not up to the usual high standard, no doubt owing to the season; neither was the market gardeners' class nor the class for table decorations as good as they ought to have been, but the hard-working and energetic Secretary, Mr. J. S. Verey, and his Committee are to be congratulated on the success of the Show under depressing financial circumstances, and we wish them better success in

NEWCASTLE.—JULY 20TH, 21ST, AND 22ND.

THE sixty-ninth Exhibition of the Durham, Northumberland, and Newcastle-on-Tyne Incorporated Botanical and Horticultural Society was held on the above dates in conjunction with the Northumberland Agricultural Society. This arrangement has proved very advantageous in the Society's interests, and the results financially have been of a most satisfactory character. The Exhibition was held in three large marquees in the Recreation Ground, North Road. This is most suitable for an Exhibition of that character, and it would be well that if in future the

Shows were always held here.

the future.

We have on many former occasions seen a greater number of exhibits. Although lacking in that respect, the quality was exceptionally good, and the Judges declared the Roses of Messrs. Harkness, Bedale, the best and largest they had seen this year. Plants were also well shown, especially the flowering stove plants, those staged by Mr. Letts falling in for a great share of admiration; his Dipladenia amabilis was a true specimen of the plantsman handicraft. It was covered to the bottom of the trellis with blooms so rich in colour. It has often been reverted to in these columns the advantage it would be to the Society if they were to give prizes for groups of plants same as of yore. The much better arrangement and artistic effects produced in grouping plants together have recently been highly developed, and to which all those who visited the York Gala can bear testimony. Had it not been for the excellent exhibits shown by the local nurserymen the Show would have been far from so attractive as it was, which in some way compensated for the group of plants that were formerly one of the salient points of the Exhibition.

Plants. — The plants were very fine, and occupied one of the tents. For six plants in bloom in the open class Mr. E. H. Letts, gardener to the Earl of Zetland, Aske Hall, was first with Dipladenia amabilis and boliviensis, both superbly flowered, and the former in addition an excellent colour; Anthurium Scherzerianum (Shuttleworth's variety), Allamandas nobilis and Wardleana, Erica Aitoniana, worth's variety), Anamandas hooms and Wardieana, Erica Artoniana, also well flowered. The first prize was £10 and the Royal Horticultural Society's medal. Mr. W. J. Morris, Felling, was second with some grand plants of Ixoras, Stephanotis floribunda, and Statice profusa. Mr. D. Wylam, Shankhouse, Cramlington, was third with Statice Batcherianum, Clerodendron Balfourianum, and Anthurium Schertzeignung. In the corresponding close for six states. Schertzerianum. In the corresponding class for six stovc and greenhouse plants Mr. F. Nicholas, gardener to Marquis of Zetland, Upleatham, was first with Stephanotis floribunda, Erica Austiniana ampullacea, Allamanda nobilis, Statice profusa, and Dipladenia boliviensis. Mr. D. Wylam was second with small plants, including Stephanotis and Clerodendron fallax. For eight foliage plants Mr. E. H. Letts was also first with Cycas circinalis, Croton angustifolius, Cycas revoluta, Kentia Fosteriana, Crotons Queen Victoria and angustifolius, and Chamærops Fortunei. Mr. J. Smith, gardener to Theo. Lange, Esq., Heathfield House, Gateshead, was second with Zamia Lehteni, a fine glaucous appearance, Kentia Fosteriana, Sabal Blackmanni, Phœnix sylvestris, Croton Victoria, and Dicksonia antarctica. For six foliage plants Mr. F. Nicholas was first, including good examples of Croton angustifolius, Dasylirion acrotrichum, Cycas circinalis, Croton Johannis, and Dicksonia antarctica.

For six exotic Ferns Mr. F. Nicholas was also first with fine plants of Davallia fijiensis plumosa, Gleichenia Mendelli, Sadleria cyathoides, Leucostegia immersa, Lomaria zamiæfolia, Davallia tenuifolia Veitchiana, the latter very graceful. This stand was fresh and beautiful. Mr. J. McIntyre was second with Adiantum concinnum latum, a fine Davallia, Gleichenia Mendelli, Microlepia hirta cristata, Adiantum farleyense, and Davallia Mooreana. In the corresponding six Ferns in the gardeners' class Mr. J. McIntyre, gardener to Mrs. Gurney Pease, Woodside, Darlington, was first; and Mr. D. Wylam second.

Cut Flowers and Table Decorations.—Table decorations and cut flowers always prove an attractive feature at this Exhibition. For table

plants Mr. McIndoe, gardener to Sir Jos. Pease, Hutton Hall, Guisboro', was first. For the epergne of cut flowers for drawing room, six competitors staged. Mrs. J. Morris, Felling, was a good first with a charming and graceful arrangement, each tier of the stand was made less in good proportions. Liliums, Dipladenias, Pancratiums, Allamandas, and other choice flowers were all used effectively. Six epergnes were staged and had a very pleasing effect on the table. Baskets of cut flowers were also well arranged. Mr. P. Robertson, Mossend Nurseries, Helensburgh was first. The flowers were choice and nicely twined round the basket. They were Pancratiums, Odontoglossum grande, Carnation Duchess of Fife, and Dendrobium Paxtoni. Mr. P. Robertson was also first with the bridal bouquet, which was not too formal, not too large, and contained the usual white flowers. Jennings, Green Market, Newcastle, was first for hand bouquet. The ladies' spray was a choice combination. Mr. J. Battensby, Swalwell, was first with Roses in bud and Cattleya amethystoglossa on Rose foliage and Adiantum gracillimum. Mr. P. Robertson was second with Odontoglossum grande on Asparagus plumosum nana. In the corresponding class Miss Edmondson, Clayton Road, Newcastle, was first for an epergne, and also first for a basket of cut flowers. Mr. T. Battensby, Hagg Hill, Blaydon, was first for a bridal bouquet, and Miss Edmondson first for a hand bouquet.

For forty-eight Roses, dissimilar, £6 and the Royal Horticultural Banksian medal arc given for first, and Messrs. Harkness & Son, Bedale, Yorks, won the leading prize with what was considered, for the season, exceptionally fine blooms both in colour and size. The best flowers were Dac de Rohan, Mdme. J. Laing, Earl Dufferin, Mdme. Hausmann, Maréchal Niel, Duchess of Fife, Merveille de Lyon, and Francisca Kruger. Mcssrs. D. & W. Croll, nurserymen, Dundee, were second, their best blooms being Margaret Dickson, Captain Christy, Souvenir d'un Ami, Innocente Pirola, the Bride, La France, 1889 (a dark Rose), Senateur Vaisse, Etienne Levet, Countess of Bedford, and Earl Dufferin. Mack & Son, Catterick, were third for thirty-six Roses, and Messrs. Harkness were also first with similar varieties to those shown in their forty-eight stand, followed by Messrs. Croll and Mack respectively. For twelve yellow Roses Mr. D. Robertson was first with Francisca Kruger, and for twelve Roses, any variety, Mr. H. May, Hope Nurseries, Bedale,

Yorks, was first with fine blooms of Alfred Colomb.

For forty-eight bunches of hardy herbaceous and border flowers correctly named, Messrs. Harkness were first; Mr. T. Battensby was second. For twenty-four Show Pansies Mr. J. Proudlock, Bates Cottages, Backworth, was first with an extraordinary fine stand, which was very much commended. For twenty-four Fancy Pansies Mr. A. Bailey, jun., Sunderland, was first. Mr. F. Nicholas was first for two bunches of cut flowers from stove or greenhouse plants. For Carnations and Picotees Mr. F. Cowdy was well first with very large blooms, which were greatly admired.

Fruit.—For a collection of fruit, eight dishes, distinct, black and white Grapes allowed as separate dishes, Mr. J. McIndoe was first with good Black Hamburgh and Muscat of Alexandria Grapes, faultless in colour, Bellegarde Peaches, Beurré Superfin Pears, some good Apples, Pitmaston Nectarines, and a very fine Melon. Mr. J. Hunter, gardener to Earl of Durham, Lambton Castle, was second with excellent Black Hamburgh and Duchess of Buccleuch Grapes, Early Mignonne Peaches, Jefferson Apples, &c. Collection of four dishes, Pines excluded, Messrs. Hunter and McIndoe reversed positions. Mr. Hunter had Black Hamburgh and Duchess of Buccleuch Grapes (very finc), Royal George Peaches, and Emperor Alexander Apples. Mr. McIndoc had Black Hamburgh Grapes, Noblesse Peaches, Beurré Superfin Pears. Mr. McIntyre was third.

For four bunches of Grapes, not less than two varieties, the Society offer £3 and the Royal Horticultural Society's bronze medal. Mr. J. Hunter was first. The Black Hamburghs were finely finished and faultless in colour, so were the Muscat of Alexandria. Mr. J. McIndoe was second with Gros Colman and Madresfield Court. Mr. W. Stewart was third; seven stands were staged. For two bunches of Muscats (white), Mr. J. McIndoe was again first, the bunches were about 3 lbs. weight, well shaped, and the berries all regular; there were no vacancies in the bunches whatever. Mr. W. Stewart, gardener to Sir Wilfrid Lawson, Brayton Manor, was first for two bunches of Buckland Sweetwater, and two excellent bunches they were. Mr. J. Atkinson, gardener to Sir Edward Blacket, Matfen Hall, was first for two Black Hamburgh bunches, nine dishes were staged. For two bunches any other variety Mr. McIndoe was again first with Gros Maroc.

Mr. Stewart was first for a scarlet-fleshed Melon. Mr. J. M'Donald, gardener to A. E. Burdon, Esq., Hartford House, was first for Peaches. For Nectarines, Mr. Geo. Marr, gardener to J. Delacourt, Esq., Thorneyholme Gardens, Clitheroe, was first with Elruge. This is a young exhibitor, and he, it is to be opined, will compete again at Newcastle. Figs, Cherries, Strawberries, and Tomatoes were also shown, Messrs. J. Hunter, J. McIndoe, T. Battensby, and J. Punton, being the respective winners. The Committee may be congratulated on their arrangements, and the cultural and financial success of the Show. Mr. J. Hood, jun., must not be forgotten for the admirable way the plants were staged, and Mr. J. Gillespie, jun., for his untiring courtesy and urbanity.

The following nurserymen contributed excellent stands of plants, which formed one of the great attractions of the Exhibition:—Messrs. Joseph Robson & Sons, Hexham, Coniferæ, Roses, and Japanese Maples. Messrs. Little & Ballantyne, Carlisle, Musa Cavendishi fruiting in a 10-inch pot, general foliage plants, which made a most effective display. Messrs. Kent & Brydon, Darlington, a general collection of stove and greenhouse plants. Mr. Ed. Jennings, Palms and greenhouse plants. Messrs. Edwards of Nottingham their rustic pots. Mr. John Forbes, Hawick, Violas and herbaceous plants, also Carnations, a Mrs. Granston a pure white, good strong habit. Messrs. Dobbie & Co., Rothesay, Violas and herbaceous plants, and named Sweet Peas. Messrs. Gunn and Co., Sunderland, garden seeds. Messrs. Wm. Fell & Co., Wentworth Nurseries, Hexham, splendid specimen Coniferæ, well adapted for decorations on a large scale. Mr. John Hood, jun., 100, Elswick Road, Newcastle, their patent bracket flask in terra-cotta, suitable for either flowers, Ferns, and table decoration. Most of these stands enumerated received medals from the Society for the excellence of their exhibits.—Bernard Cowan, F.R.H.S.

EARL'S COURT.—JULY 26TH.

This Show should have been largely made up of Carnations, but the season somewhat upset the arrangements. There was, however, a fair number of these flowers, more, probably, than most persons expected, and the quality throughout was very good. So far as the principal classes were concerned the result corresponded with that at some of the leading Rose shows, a northern exhibitor coming southward and carrying away the chief prizes. He fairly defeated such sterling growers as Messrs. Turner and Douglas, but neither of these was able to show as well as usual at this time of year, and another season the victorious northerner may not find them so easily overthrown. The Carnations were supplemented by some splendid collections of hardy flowers and excellent fruit, the collective display was a good one. The Grapes were particularly noteworthy. The competition with them was very lively, and there was hardly an inferior bunch in the whole number shown. Black Hamburgh and Gros Maroc were splendidly represented.

There were two stands of twenty-four Carnations, the first prize going to an exhibitor whose name is not very familiar in the south—Mr. E. Shaw, Moston, Manchester. His flowers were somewhat small, but very smeoth and fresh. Mr. J. Douglas, Edenside Gardens, Great Bookham was second with larger but somewhat rougher flowers. There were also two stands of twelve, but they were far from good, and only the second prize was awarded, this going to Mr. Chaundy, Oxford. Mr. Chas. Turner had a very beautiful stand of twenty-four yellow grounds, and defcated Mr. Douglas somewhat easily. Mr. Chaundy was the only exhibitor of twelve, and was placed first for a very neat box. The Slough grower won again with twenty-four selfs and fancies, having good blooms of high-class varieties. Mr. Chaundy was second, and Mr. Douglas third. Mr. Shaw was not opposed with twelve, and received the first prize for a very good box. The Manchester grower secured another highly creditable victory with twenty-four Picotees, having very clean, smooth, fresh, and well filled blooms. Mr. Turner was second, and Mr. Douglas third. The only stand of twelve was that from Mr. Chaundy, and the third prize represented its merits. Mr. Sage won with border Carnations; Messrs. Paul & Son, Cheshunt, second. Mr. Turner was first, Mr. Douglas second, and Mr. Sage third with selfs, Mr. Douglas's variety, a new one named Crimson King, receiving a first-class certificate. Mr. C. B. Cole had a beautifully arranged vase, and was placed first, Mr. N. H. Cole being second, Messrs. G. Walton and J. Douglas equal third. Mr. Turner received a certificate for a bright scarlet self named Mrs. Apstey Smith.

Fruit was a very good display, particularly the Grapes. Five competed with three varieties, two bunches of each, and all had good clusters. Mr. Osman, Ottershaw Park Gardens, Chertsey, won with fine bunches of Black Hamburgh, Foster's Seedling, and Muscat of Alexandria. Mr. Tidy, gardener to W. K. D'Arcy, Esq., Stanmore Hail, Great Stanmore, was second with Gros Maroc splendidly coloured, Foster's Seedling, and Muscat of Alexandria; and Mr. W. Messenger, gardener to C. H. Berners, Esq., Woolverstone Park, Ipswich, was third with Golden Queen, Gros Maroc, and Black Hamburgh. Nine competed with three bunches of black Grapes, the first prize going to Mr. Friend, gardener to the Hon. P. C. Glyn, Rooks Nest, Godstone, for Black Hamburgh finely berried; the second to Mr. Mcssenger for the same variety, larger bunches but smaller berries, and the third to Mr. Osman, who also had Black Hamburgh. There were four stands of three whites, Mr. W. H. Lees, Trent Park Gardens, New Barnet, winning with very large clusters of Muscat of Alexandria, Mr. Tidy being second, and Mr. Howe, gardener to H. Tate, Esq., Streatham, third, with the same variety. The best of eight dishes of Apricots came from Mr. Lees. The variety was Moor Park, and the fruit very fine. Mr. Messenger was second, and Mr. Maxim, gardener to the Hon. Miss Shaw Lefevre third. The prizes for Peaches went to Messrs. Maxim, W. H. Lees, and Messenger, in the order of their names, the fruit being excellent. Mr. Tidy was first, Mr. G. H. Sage, Ham House Gardens second, and Mr. Wallis, gardener to R. Sneyd, Esq., third with Plums, the first named having a grand dish of Jefferson's. The prizes for Apples and Pears went to Messrs. Grindrod, J. C. Mundell, J. Friend, T. A. Hester, and A. Maxim.

The competing exhibits of hardy flowers made a brilliant display. Messrs. Paul & Son, Cheshunt, had a splendid collection of twenty-four, winning from Messrs. Sage and Such, who also showed well. Mr. Sage won with twelve bunches, Messrs. Newell and Wythes following. The prizes for Sweet Peas went to Messrs. Newell, Eckford, Elphinstone, and Sage.

The miscellancous exhibits comprised quite half the show, and for several displays medals were awarded, but they had not been announced when our reporter left. Messrs. Barr & Son occupied almost the whole of one side of the tent with a beautiful display of hardy flowers,

amongst which were Hyacinthus candicans, perennial Phloxes, Liliums, Delphiniums, Statices, and Campanulas. Adjoining this collection were a number of Melons (Beauty of Syon), Apricots, and Morello Cherries from Mr. Wythes, gardener to the Duke of Northumberland, Syon House, all indicating excellent culture. The Cherries and Apricots were remarkable for their high colouring. Mr. Wythes also contributed a very attractive group of plants, in which Campanula pyramidalis and C. p. alba were very foundations.

Messrs. Prior & Co., Colchester, staged a splendid lot of Roses, the flowers being particularly clean and fresh. Mr. Henry Eckford was represented by some familiar friends in the shape of a delightful collection of his choice Sweet Peas. Mr. Eric Such had a charming display of perennial Phloxes and Gaillardias. The latter, arranged in bunches of ten in the same way as single Dahlias are exhibited, and with Asparagus foliage, were really beautiful, and the idea is worth copying. Messrs. Laing & Sons had a splendid stand of single Begonias, and another of doubles, together with a very large and diversified collection of hardy flowers, the whole display making one of the best in the Show. Messrs. Wm. Paul & Son, Waltham Cross, had a collection of fruit trees in pots, including Figs, Apples, Peaches, Plums, and Pears, the trees being well grown and fruiting freely. Messrs. Paul & Son, Cheshunt, contributed a very beautiful collection of Roses, Carnations, and other hardy flowers. The Carnations, tied up loosely in bunches of five with their own foliage, presented a delightful effect. There were several stands of them, alternating with Roses. Mr. Chas. Turner had a neat and pleasing collection of Carnations. Messrs. Cannell & Sons contributed a collection of Melons, and Mr. R. Grindrod some very good Gooseberries, Currants, Cherries, and Apricots. Messrs. Laxton Bros. had plants of their excellent Strawberry Royal Sovereign.

WEST OF ENGLAND CARNATION AND PICOTEE SOCIETY.—JULY 19TH.

THE first Exhibition of this new Society was held in the Clifton Zoological Gardens, Bristol, July 19th, and although so many collections were out of flower, there was a fair display. In the class for twelve Carnations Mr. A. R. Brown, Handsworth, Birmingham, was first with C. H. Herbert, Mrs. Barlow, Geggie's Tom Pinley, Douglas's No. 37, John Payne, Squire Llewellyn, Geggie's Ellis Crossley, Samson, Geggie's Tom M'Creath, Douglas's Virgil (bright in colour), Rosy Morn, and Admiral Curzon. Mr. T. Hooper, Bath, was second, and Mr. F. Hooper, Chippenham, third. For six Carnations Mr. Dowell, Chew Magna, Bristol, was first.

For twelve Picotees Mr. Charles Pinder, Slough, was first with Morna, Lyddington's Favouritc, Nellie (very fine), Lady Holmesdale, John Archer, Thomas William (good), Adolphus, Princess of Wales, Lady Emily Van de Weyer (fine), and J. B. Bryant and Mary (both fine). Mr. A. R. Brown, Birmingham, was second, in whose stand were good blooms of Little Phil, Mrs. Beal, Thomas William, and Mrs. Payne. Mr. F. Hooper was third. For six Picotees Mr. F. W. Barker, Bristol, was first with Ethel, Nymph, Edith D'Ombrain, Mrs. Chancellor, and two of Hooper's seedlings.

In the class for twelve yellow-ground Picotces, Mr. Charles Turner, Slough, was first with Mrs. Henwood, Stadrath Bail, Annie Douglas (a seedling like Lilian), Mafret, Mrs. Arthur Barrett (high coloured), Nellie and Edith M. Wynne (both very fine), Lilian, Agnes Chambers, and Mrs. Robert Sydenham. Mr. Arthur Brown was second, in whose stand were blooms of Friedrich Wagner, Almira, Mrs. R. Sydenham, and Janira. Mr. F. Hooper was third. For six yellow-grounds, the Rev. G. R. Brown, Iron Acton, Bristol, was first with Countess of Jersey, Dorothy, Mrs. Henwood, Victoria, Lady Edwards, and Mrs. Robert Sydenham. Mr. F. W. Baker, Keynsham, was second.

For twelve Selfs or Fancies, Mr. Charles Turner, Slough, was first with Germania Ruby Almira King of Scarlets Terra Cotta, Salamander.

For twelve Selfs or Fancies, Mr. Charles Turner, Slough, was first with Germania, Ruby, Almira, King of Scarlets, Terra Cotta, Salamander, The Governor, Romulus, Duchess of Sutherland, Kæning Albert, Rose Unique (very fine), and Janira. Mr. A. R. Brown was second with Ruby, Mrs. F. Baker, Madame Van Houtte, and Schleiben. Mr. F. Hooper was third.

Single blooms were shown as follows:—Bizarres and flakes: First, Mr. A. R. Brown with Joe Edwards; second, Mr. A. R. Brown with Jim's Favourite (Geggie); third, Mr. F. Hooper with Matador. Picotees: First, Mr. A. R. Brown with Thomas William; second, Mr. C. Turner with Thomas William. Third, Mr. C. Turner with Nellie. Yellow-ground Picotees: First, Mr. C. Turner with Countess of Jersey; second, Rev. G. R. Brown with Mrs. Henwood; third, Mr. A. R. Brown with Queen Boadicea (Simonite). Selfs: First, Mr. A. R. Brown with a grand bloom of Rose Unique; second, Mr. C. Turner with Salamander; third, Mr. A. R. Brown with Master Fred.

The premier Carnation was Admiral Curzon in Mr. Brown's first prize stand of twelve. The premier Picotee was Thomas William in Mr. Turner's first prize stand of twelve. The premier yellow ground was Mr. Robert Sydenham in Mr. C. Turner's first prize stand of twelve.

Mr. Charles Turner's silver medal for twelve self Carnations was won by Mr. A. R. Brown, his finest blooms being Rose Unique, Ruby, Benary's Wieland, Aureole (Chaundy), Mrs. Fred, and Rose Wynne.

A first-class certificate was awarded to a superb pure white tree Carnation named Blagdon Surprise, with a flower almost as good in quality as Mrs. Fred and the plant of good habit. This was exhibited by Mr. A. Ambrosc, gardener to F. R. Robinson, Esq., Sneyd Park, Bristol.

THE MIDLAND COUNTIES CARNATION AND PICOTEE SOCIETY.—JULY 22ND.

THE third annual Exhibition of this flourishing Society was held in the Edgbaston Botanical Gardens, Birmingham, on Saturday, July 22nd, and there was a very large display of blooms and a close competition. Carnations were not up to their usual standard, as so few blooms were left, owing to the early season.

For twelve blooms of Carnations Mr. Tom Lord, Todmorden, was first; Mr. Robert Sydenham second; Mr. John Whitham, Hebden Bridge, third; Messrs. Thomson & Co. fourth; Mr. E. Shaw, Manchester, fifth; Mr. Chas. Freeland, Larkhall, N.B., sixth; and Mr. Henry Geggie, Bury, Lancashire, seventh. In the class for twelve Picotees there were eleven exhibits, and better quality prevailed throughout, competition being close. Mr. Robert Sydenham was first with fine blooms of Mr. J. P. Sharps, fine seedling Rosey Sydenham. a superb flower; Mrs. Coldridge, Polly Brazil, Nellie, and Mrs. Payne, all very fine. Messrs. Thomson & Co., Birmingham, were second with a grand bloom of Nellie in this stand. Mr. Arthur Brown, Handsworth, was third, and in this stand were fine blooms of Pride of Leyton and Mrs. S. Beal (both new), also Mrs. Payne. Mr. J. Whitham was fourth; Mr. Tom Lord fifth; Mr. E. Shaw sixth; Mr. Wm. Spencer, jun., Birmingham, seventh.

In the class for twelve yellow-ground flowers Mr. Robert Sydenham, Birmingham, was first with very fine blooms of Countess of Jersey, Janira, Romulus, Mrs. Henwood, Stadrath Bail, Schleiben, Brockhaus, Victory, Mrs. Robert Sydenham, A. W. Jones, and others. Messrs. Thomson & Co., Sparkhill Nurseries, was second; Mr. Charles Turner, Slough, third; Mr. Arthur Medhurst, Oxford, fourth; Mr. B. Simonite,

Sheffield, fifth; and Mr. J. H. Wilson, Birmingham, sixth.

In the class for twelve selfs Mr. Robert Sydenham was first with Germania, Ruby, Gladys, Justinian (light pink), Blushing Bride (a fine bright scarlet seedling), Annie Lakin, Joe Willett, Queen of Buffs, Theodore Aureole, and a dark sport from C. H. Herbert. Mr. A. Medhurst was second with seedlings; Messrs. Thomson & Co. third; Mr. C. Turner fourth; Mr. Wilson fifth. In the class for six Carnations, Mr. Crossley Head, Hebden Bridge, was first; Mr. Ben Simonite second; Mr. A. Medhurst third; Mr. Joe Edwards, Manchester, fourth; Mr. William; Kenyon fifth; Mr. C. F. Thurstans, Wolverhampton, sixth, and Mr. James Bleakley, Manchester, seventh. For six Picotees there were nineteen competitors. Mr. Crossley Head first; Mr. Thurstans second; Mr. A. W. Jones, Handsworth, third; Mr. W. Kenyon fourth; Mr. J. P. Sharp fifth; Mr. William Spencer, Birmingham, sixth; Mr. James Bleakley seventh.

For six fancies of yellow grounds M. A. W. Jones was first; Mr. Arthur Brown, second; Mr. Spencer, third; Mr. George Chaundy, Oxford, fourth; Mr. R. Makepeace, Leicester, fifth; Mr. George Eyre, Derby, sixth; Mr. Ed. Hill, Nottingham, seventh. The classes for six selfs and for the maiden exhibitors were well contested. Classes 10 to 28 were for single blooms, four prizes in a class, and eighty-two prizes,

but we have not space for enumerating all these.

The premiers were—Bizarre Carnation, Mr. Tom Lord with Master Fred; flake Carnation, Mr. B. Simonite with Sportsman; self Carnation, Mr. C. Turner with Germania; yellow ground Picotee, Mr. W. Spencer with Mrs. Robt. Sydenham; heavy edge Picotee, Mr. A. W. Jones with Mrs. Payne; light edge Picotee, Mr. R. Sydenham with Thomas William.

Class 29 was for twelve varieties of border Carnations, five strains of each. Messrs. Thomson & Co. were first; Miss Perkins, Leamington, second; Messrs. Hewitt & Co., Birmingham, third; Mr. Simon Rogers, Whittlesey, Peterborough, fourth; Mr. W. H. Divers, Ketton Hall Gardens, fifth. For six varieties of border kinds, three stems of each, Mr. Thurstans was first; Mr. Wm. Barsby, Lincoln, second; Mr. George Chaundy third; Mr. E. M. Sharp, Edgbaston, fourth.

There was an excellent exhibition of shower bouquets, sprays, and baskets all of Carnations and Picetons and much competition. Plants

There was an excellent exhibition of shower bouquets, sprays, and baskets, all of Carnations and Picotees, and much competition. Plants in pots, six varieties, brought out three exhibitors. Extra prizes were offered for bouquets and sprays of Sweet Peas, and some very pretty exhibits were staged, Mrs. Thewles, Floral Depôt, New Street Station, easily taking the first prize with a charming shower bouquet of pale pink flowers.

Certificates of merit were awarded to Messrs. Thomson & Co., Sparkhill Nurseries, for a new dark, rich-coloured self Carnation, Topsy, and a very fine yellow-ground Picotee, Mrs. Spencer, and to Mr. George Chaundy, Oxford, for a new S.B. Carnation, Albert Whitham.

The Birmingham Botanical Society's two silver medals for the greatest number of points in certain classes were awarded to Mr. Robert Sydenham and to Messrs. Hewitt & Co. The Botanical Society's two bronze medals for the second most successful exhibitors in the same classes were awarded to Messrs. Thomson & Co. and Miss Perkins. A silver medal was awarded to Mr. W. Jones, Handsworth, Birmingham, for excellence of culture.

The honorary exhibits are invariably so good at these Exhibitions that silver and bronze medals are given by the Carnation Society for exhibits of exceptional merit. Silver medals were awarded to Messrs. Hewitt & Co., Solihull Nurseries, for a very fine display of Tuberous Begonias and hardy cut blooms; to Mr. J. White, nurseryman, Worcester, for collection of cut flowers of various kinds; to Mr. B. R. Davis, Yeovil, for a superb display of his excellent double Begonias; and to Messrs. Thomson & Co., Sparkhill Nurseries, for an extensive display of border Carnations and Picotees. Bronze medals were awarded to

Messrs. Jarman & Co., Chard, Somerset, for herbaceous and other cut flowers; and to Mr. Hy. Eckford, Wem, for new and other Sweet Peas of his own raising. Nearly £110 was offered in prizes and medals, and excellent arrangements were made for the Exhibition by Mr. W. B. Latham, the Curator of the gardens.

FRUIT FORCING.

Pines.-As houses become vacant clean them thoroughly before being again occupied with plants. The first thing to be seen to is the bed. If bottom heat be afforded by hot-water pipes, the material forming the bed, whether of tan or leaves, should be removed at least once a year, or woodlice and other predatory vermin rapidly increase, and are harboured by the old material. Syringe every part of the house with hot water, thoroughly cleansing the wood and ironwork with soap and water, using a brush, and keeping the soapy water from the glass, which should be cleaned inside and outside with pure water only. Scald all brickwork and brush with hot limewash, reaching well into holes and crevices. Paint the wood and ironwork, and make the roof as waterproof as possible, as much damage is caused by water dripping on the foliage. Chambered beds heated with hot-water pipes are much in advance of those surrounded or passing through beds of rubble. Those composed of the latter should be turned over, and any dirt or small parts removed to allow the heat given off to penetrate through the whole uniformly to the bed. Fresh tan should be provided in other cases. If wet, turn it occasionally on fine days. With hot-water pipes beneath about 3 feet depth of tan is ample, more will be needed where such aid is not provided. In most cases it will only be necessary to mix new tan with the least reduced portion of the old, this being sifted and the fine rejected.

Routine.—Suckers started in June will soon fill their pots with roots, and must be shifted into the fruiting pots before the roots become closely matted together. Queens, Envilles, and moderate-growing kinds generally succeed well in 9 or 10-inch pots, those of stronger growth should have 11-inch pots. Water immediately after potting if the soil be dry, not otherwise, and plunge in a bottom heat of 90° to 95°. Crowding young plants is a great mistake, as they become drawn and weakly instead of forming a sturdy growth, a condition that should always be aimed at. Attend to the bottom heat of beds that have recently been disturbed by renewal and replacing of plants, not allowing the heat at the base of the pots to exceed 95° without immediately raising them, as too much bottom heat will disastrously affect plants having the pots filled with roots or those with fruit. Examine the plants for water about twice a week, supplying it only to those in need. Maintain a moist, genial, and well ventilated atmosphere. The change in the weather has produced climatic conditions favourable to growth, so that Pine plants grow luxuriantly, therefore discontinue any shading such as may have been employed for an hour or two at midday, when the sun was powerful through the months of May, June, and this, the plants being given all the light possible, admitting air early, especially after dull periods, and plentifully when the temperature ranges from 85° to 95°. Afford fruiting plants a night temperature of 70° to 75°, 65° to 70° at night sufficing for successional plants. Some suckers should be reserved on the stools for starting in September, but they must not be allowed to become too large, detaching and potting them if necessary.

Cherry House.—The trees have now plumped the buds, and the leaves are not capable of much further effort in elaborating the sap and storing it in the buds and adjacent wood, therefore any undue excitement will cause the trees to start into fresh growth. This must be guarded against by exposing the trees to the influence of the atmosphere so far as the house will admit, as the best means of arresting premature growth, to which the Cherry is liable when forced year after year successively. The roof lights must be removed; t ees in pots should be placed outdoors, plunging the pots in ashes. If the roof lights are fixed ventilate to the fullest extent. The borders must not be allowed to become dry, but have copious supplies of water, and if the trees are weak afford liquid manure. To subdue red spider give an occasional washing with the syringe or garden engine. Promptly subdue black aphides with tobacco water. Trees in pots must be regularly syringed and watered to preserve the foliage in a healthy condition.

Figs. — Early Forced Trees in Pots. — When the second crop is gathered examine the trees for red spider and brown scale; keeping the trees somewhat drier at the roots and the freer ventilation to insure a drier atmosphere tends to an increase of these pests. Now that the wood is firm, and there is less danger of injuring the foliage than at an earlier stage, an insecticide may be used for their annihilation more successfully. A petroleum mixture is very effective against scale, and if softsoap is added it is fatal to red spider. Dissolve 8 ozs. of softsoap and 1 oz. of washing soda in 4 gallons of boiling water, add a

wineglassful of petroleum, and apply when cooled to 100° with a syringe. Keep the mixture well mixed by alternate squirts into the vessel and on the plants, which should be well wetted in every part, and if they cannot be laid on their sides and turned over a little dry moss may be tied around the stem, and a sort of pyramid placed about the plants to prevent the solution soaking into the soil. If the wood is badly infested with scale employ a somewhat stiff brush to dislodge it whilst wet. Similar means may be pursued with the leaves, damaging them as little as possible. In bad cases repeat the treatment in a day or two, afterwards syringing thoroughly with tepid water. The trees will need water only to prevent the foliage becoming limp, ventilating to the fullest extent day and night, but protect from heavy rains, which has a tendency to keep the trees active instead of inducing rest. This is absolutely essential to trees subjected to early forcing. For these considerations early forced potted trees should not be placed outdoors if there is any doubt about the maturity of the wood, and they cannot have complete rest if the weather prove wet. If placed outdoors it must be in a sunny position, and the pots stood on rough ashes with finer about them.

Early Forced Planted out Trees.—Admit enough air to ensure a circulation constantly, ventilating freely by day. If dull weather prevail a gentle heat in the hot-water pipes will favour the ripening of the fruit, which is insipid or highly flavoured according to the heat and air. Diminish the watering at the root and discontinue syringing over the trees, but a moderate air moisture may be secured by damping occasionally for the benefit of the foliage. If red spider prove troublesome heat the pipes on a calm evening to 170° and paint them with sulphur brought to the consistency of cream with skim milk, having the house closed, and keeping the pipes hot about an hour, then allow them to cool and the temperature to fall to its usual degree. Repeat in the course of a week to destroy any pests then emerged from the eggs. As soon as the fruit is gathered cleanse thoroughly with the syringe or engine, freeing the trees of red spider, and maintain a free circulation of rather dry warm air until the foliage begins to fall naturally, but it must not be accelerated by allowing the soil to become dust dry at the roots of the trees.

Unheated Fig Houses.—The fruit is now well advanced to maturity and in some cases ripening. Where it is swelling no pains should be spared to keep the foliage clean by syringing in the morning and early afternoon. Do not syringe, however, if the day is likely to be dull, or in the afternoon if there is a prospect of the foliage not becoming dry before night. Under those circumstances damp the border, especially in the afternoon. Admit a little air early, increasing it with the sun heat, maintaining through the day at 80° to 85° with free ventilation, closing early so as to increase the temperature to 90° to 95°, and when the sun's power is declining a little air may be admitted at the top of the house, so as to allow the pent-up moisture to escape and the temperature to gradually cco'. Supply water or liquid manure to the roots according to circumstances, so as to keep the soil in a thoroughly moist condition. With the fruit advancing for ripening lessen the supply of water and discontinue syringing, securing a circulation of air constantly, and ventilate freely when favourable. Husband sun heat, which will not do any harm if the atmosphere is not confined, a little ventilation being given to allow of the moisture escaping instead of condensing on the fruit and causing it to crack and spot.

Cucumbers.—Pot the seedlings for autumn fruiting as they become ready, placing a stick to each plant intended for trelliswork, and pinching out the point of such as are required for growing in frames or pits, at the second rough leaf. Prepare fermenting materials to afford bottom heat for the latter, and cleanse houses thoroughly, the woodwork with hot water, soap, and a brush, the glass with clear water, and limewash the walls. Remove all the old soil and make everything as clean and sweet as possible. Turfy loam stacked until the herbage is dead, a tenth of charcoal, and a sixth of old mortar rubbish thoroughly incorporated form a suitable compost. If heavy add an equal proportion of fibrous sandy peat to the loam.

If the weather prove cold and sunless it will be necessary to employ a little fire heat, as a low temperature induces stunted fruits, canker at the collar, and mildew on the foliage. Enough artificial heat should be used in such weather to maintain a night temperature of 65° to 70°, and 70° to 75° by day. Sulphur dusted on the foliage is the best cure for mildew, and quicklime rubbed into the affected parts acts well against canker. If aphides appear fumigate in a calm evening and repeat early the following morning. After a period of dull weather shade on a return of bright sun so as to prevent flagging. Keep the growths regularly attended to twice a week, remove exhausted growths, and maintain a succession of bearing wood by laying in young fruitful growths. Close early, running up to 90° to 100°, and ventilate early and moderately, keeping up a good moisture by frequently damping available surfaces.

THE KITCHEN GARDEN.

Potatoes.—A complete change in the weather would appear to be very general, and most probably Potato disease will become prevalent. Those who mean trying the effects of the sucrated bouillie bordelaise will now have good opportunities for so doing. The first dressing ought to have been applied in anticipation of disease, and preferably on a dry day, a second application being advisable about a month later. This season, owing to the forwardness of the crops, early lifting would have been found the best preventive of disease. Once more it may be

pointed out that there is no necessity to wait for the haulm to die down before lifting and storing commences. Once tuber growth has ceased and the skins are set, nothing further will be gained, and much may be lost by leaving them in the ground. Should it be inconvenient to lift the crops just now, be content to draw the haulm and wheel this away. In most fairly warm districts the early and the bulk of second early varietics are quite fit for lifting. Unfortunately, the drought has checked the progress of late varieties in all cases where the soil was poor and non-retentive of moisture, and this will most probably be followed by pro-tuberation. There is no help for this, unless, indeed, the first-formed crop happens to be large enough for lifting. Many of the second earlies will also grow out; but this should be prevented by either lifting or haulm-drawing.

Turnips.—It is not often that there are too many of these grown for winter use, and this scason better opportunities than usual will be afforded for growing extra large breadths. Some portions of the ground cleared of second early Potatoes should be devoted to Turnips, the earliest opportunity of sowing the seed of the latter in quantity being taken. As the Potatoes are lifted the whole of the ground should be forked over, levelled, and all lumps broken down. If this is delayed for a few days the soil will not work so well, and seed sowing be a more difficult operation. Some of the best Turnips for present sowing are Snowball, Veitch's Red Globe, Orange Jelly, and Chirk Castle Black Stone. For the three first named the drills may well be drawn 15 inches apart, 12 inches being ample for the latter. As far as hardiness is concerned Chirk Castle Black Stone is the best, the quality also being superior. If the drills are at all dry moisten prior to sowing, and in any case distribute the seed thinly, or much extra thinning out will be necessary. If birds commence drawing the seedlings just as they are coming through the soil dust the latter over with soot and lime while the dew is on them.

Endive.—Very early raised Endive is not to be depended upon, the bulk of it running to seed prematurely. About the middle of July is a good time to sow, the plants thus obtained attaining their full size before wintry weather sets in, and keeping well when stored. Good forms or selections of Green Curled and the Broad-leaved Batavian are the best that can be grown. Supposing a wall border or sunny plot of rather high ground has been duly cleared of early Potatoes, this should be prepared as advised in the case of Turnips. It is the least trouble to sow the seed thinly where the plants are to remain, the drills being drawn 12 inches apart. Space not being available for this, sow the seed in drills 6 inches asunder, and eventually transplant the greater part of the seedlings, leaving the rest to grow to their full size where they are. Early Endive can also be had by sowing the seed broadcast in beds, and the seedlings being thinned to about 6 inches apart each way, they soon press against each other and are self-blanching accordingly.

Lettuce.—It is yet somewhat early to sow Lettuce seed in quantity with a view to having abundance in the autumn and early winter, but should the next two or three months prove as wet and dull as predicted, then it might happen that the July-raised plants will be extra serviceable. Anyway, there should be no cessation of the pains taken in keeping up a good supply of Lettuce, fortnightly sowings being none too often. With each selection of varieties the Black-seeded Brown Cos ought always to be sown, this variety if well grown being one of the best. These may well follow Potatoes, the plants being raised where they are to remain. Sow the seed thinly in drills 10 inches or 12 inches asunder.

Cabbage.—Coleworts or small quick-hearting Cabbages ought to be already in rough leaf, though if other winter vegetables are scarce more seed should be sown. If these late-raised plants fail to heart in where they are planted thickly the tops may yet prove very acceptable. Seed may be sown thinly in drills 12 inches apart, and the plants allowed to remain where they come up. Now is also the best time for sowing seed of Ellam's Dwarf Spring, Wheeler's Imperial, Little Pixie, Hill's Incomparable, and other favourite neat growing varieties. The plants resulting should be ready to form a close succession to spring sown Onions. The more vigorous varieties should be sown a fortnight or three weeks later, as plants of these when raised early are apt to bolt.

Late Peas.—Now that there has been a welcome change in the weather there is a better prospect of the late-sown Ne Plus Ultra Peas and such like growing more strongly than was the case during the very hot and dry weather. There is, however, no certainty about their holding out till frost intervenes, and if extra late Peas must be had more seed ought to be sown. This time the preference should be given to this season's seed of Exonian, William I., Daisy, Chelsea Gem, English Wonder, or any other good first or second early varieties. New seed germinates the most strongly, the plants throughout being more vigorous than those resulting from old seed. The centres of wide spaces between Celery trenches answer for a single row, or the seed may be sown on other rather high ground, early frosts being most felt in the lower part of many gardens. Moisten the rather deep drills if at all dry, covering the seed with about 3 inches of soil. Surface mulchings and waterings in dry weather are considered of much importance.

APIARIAN NOTES.

NOTES FROM THE MOORS.

Since the bees were taken to the Heather the weather has been wet and stormy. More bees have been lost in a few days than there were last year, there being more inducement for them to fly out, and, owing to want of sunshine, the chilled bees overtaken by the lashing showers never rise. These phenomena in hilly districts are more frequent and extraordinary than in the lowlands. On the 19th, between 1 and 2 P.M., when the sun for a brief period shone out with all her spiendour, the air became suddenly very cold, lasting for about fifteen minutes, with a strong wind at the time. Bees fell in showers to the ground, and I had to take shelter, and retreat homewards.

The bees are anxious to work, the flowers being so profuse, and with but one week's calm and fair weather they would gather large quantities of honey. Swarming with all the untoward weather has been prevalent, proving that the advice to the effect that timely room will prevent it is erroneous. An unparalleled case has been brought under my notice this week. After two or three virgin queens had piped and lived together in one hive swarming took place. It is somewhere about eight years since I stated in this Journal a case where three weeks expired after the queens were hatched before they swarmed, and showed the desirability where profit was concerned of getting rid of all the surplus ones at the earliest opportunity.

Punics.

As usual I meet with bee-keepers from different localities who have their bees near mine. One man accosted me with, "How have your Punics done this year?" I replied, and repeated some of the advice that has appeared in the pages of the Journal of Horticulture. Another person exclaimed, "My Punics have been by far my best hives, both last year and this one." The first who spoke explained "that he put supers upon a swarm a few days hived, and in two weeks after they were filled and prettily sealed." Surely these facts disprove the assertions made against these bees. My prime swarm mentioned several weeks since has increased in weight 45 lbs., excelling my others, nearly the one-half of that being gathered after the weather had broken. There is little necessity looking after their doorways, they contract or extend them themselves as circumstances demand.

There are perhaps some persons who may after all these facts have been published still endeavour to disprove them, but let all who seek after truth pay me and my hives a visit, and they will learn more truth in an hour than in years by merely reading what is said about the Punic bees by writers who have had no actual experience with them.—A LANARKSHIRE BEE-KEEPER.

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Bees (F. J. W.).—Your letter is received, and the required information will be given as soon as possible.

National Rose Society's Catalogue (Rosarian). — You will find an answer to your question on page 72 of the present issue.

Light Reading (S. J. A.).—Amusing and refreshing, but should have been sent a day sooner to secure insertion.

Book on Table Decoration (G. W. R.).—"Table Decoration," by William Low, and published by Messrs. Chapman & Hall, London, would meet your requirements. It could no doubt be obtained through any bookseller.

Raw Bones and Chrysanthemums (W. A. M.).—Evidently the bones used as drainage are injuring your plants. Clear lime water will not hurt them, and may, or may not, destroy the maggots. Cannot you carefully turn the plants out of their pots and remove the cause of the evil? It may be tedious work, but will be the best way of improving the plants.

Boronia polygalifolia (L. M.).—You are correct in saying that this Boronia is "comparatively little known," but it is one of the most useful of the genus. In few gardens, however, it is largely grown, but wherever it has been fairly tried the highest opinion is held of its merits as a greenhouse or conservatory plant. Perhaps the best examples of its utility can be seen at Kew in the greenhouse, where during the spring and early summer months plants with quite masses of flowers are very noticeable upon the side shelves. These are borne on corymbose heads, are of a bright rosy-lilac hue, and last a considerable time either upon the plant or when cut. The growth being very free, the plant will endure hard cutting, a valuable quality when flowers are so largely in demand; and though the colour is not so brilliant or startling as that of some plants, it is a shade that can be readily associated with many others without producing any unpleasant discord. It requires similar treatment to other species of the genus.

Heaviest Bunch of Grapes (Young Gardener).—We have many times answered similar questions to yours, and can only repeat that the heaviest bunch of Grapes we have seen, and so far as we know that has been officially recorded, was a bunch of the Calabrian Raisin, weighing 26 lbs. 4 ozs., grown by Mr. Curror, gardener to J. Douglas, Esq., Eskbank, Dalkeith, and exhibited in Edinburgh on September 15th, 1875. A bunch of Syrian grown by the late Mr. Dickson, gardener to J. Jardine, Esq., Arkleton, Langholm, weighed at the same show 25 lbs., 15 ozs. This appeared to be the larger bunch of the two, the berries having been more thinned than the former. Mr. Dickson has stated that the bunch when cut weighed 26 lbs. 8 ozs., so that either it must have lost weight before it reached the show or there was a difference in the scales employed in the two instances. An illustration of this bunch was reproduced in the Journal of Horticulture for December 29th, 1892. Mr. Roberts, The Gardens, Charleville Forest, Tullamore, has grown a bunch of Gros Guillaume weighing 23 lbs. 5 ozs.

Acacia grandis (Amateur).—The plant to which you allude is no doubt Acacia grandis, which is a native of Western Australia. It forms a shrub of moderate size, and flowers freely while small. The stems are angular, grooved, and usually, but not invariably, quite glabrous. The leaves consist of two pinnæ articulated at their base, each pinna being about an inch long, and composed of from eight to ten pairs of linear, alternate, smooth leaflets, the rachis or stalk to which they are attached being flattened, and terminated by a small leafy point. A. grandis is a most charming plant for spring flowering, being at that season loaded with its golden yellow balls; and at all periods of the year its elegant foliage gives it an ornamental character. Its propagation is effected either by seeds or cuttings, usually by the latter method; they should be inserted in white sand, or very sandy soil, and covered with a bell-glass or tumbler. As they are impatient of damp, they require a little more care during the rooting process than those of the leafless species. The inside of the glass should be wiped daily, and as soon as the cuttings are well rooted they must be potted into sandy peat, and eventually into good fibrous peat containing less sand.

American Ginseng (L. B.).—You desire to know something about "American Ginseng, which is highly valued as a medicine by the Chinese." The following extract from a recent number of the "Kew Bulletin" exactly answers your question: -- "The American Ginseng to the natural order Araliaceæ, an order closely allied belongs to the Umbelliferæ. Amongst Araliaceæ are included of very different habits and characters, such as Panax, the tropical Sciadophyllum and Hedera (the common Ivy). Fatsia, quinquefolia, A. Gray, has a low herbaceous stem seldom more than a foot or 15 inches high. The leaves are long-stalked, palmatisect, with usually five leaflets (hence the specific name), arranged in a whorl of three or four at the summit of the stem; the leaflets have generally three larger than the others, they are somewhat thin, obovate-oblong, pointed and serrate. A single umbel of flowers appears on the short, slender, terminal peduncle with small yellowish flowers. The calyx is adherent to the ovary and surmounts it with five minute teeth. The corolla is made up of five small oval white petals which soon fade away. The stamens (when present) are five in number, with small heart-shaped anthers, and there are two, sometimes three, persistent ordinary curved styles. The ovaries expand into small round bright red berries about the size of small peas, each with two seeds. The root (the part used) is tuberous, 3 or 4 inches long and usually branching into two or three tapshaped divisions. It is wrinkled by parallel transverse ridges, and gives rise to a number of fibrous rootlets. The upper portions of the root-tuber show several angular scars, the remains of previous stems which die down annually. down annually. As the roots increase with age they often assume strange forms, and such roots are highly prized, the Chinese readily giving large sums for them. In America the roots are not regarded as possessing active medicinal properties. They have, however, an aromatic bitter-sweet taste, are somewhat mucilaginous, and may have a mild, stimulant, tonic effect."

LTHOUGH the great work that has been conducted for fifty years on the Rothamsted Park estate of Sir John Bennett Lawes and his talented and energetic coadjutor, Dr. J. H. Gilbert, is of agricultural interest mainly, we make no apology for inserting a report of the proceedings on another page in honour of those workers in science in its direct bearings on the cultivation of the soil; nor do we hesitate to make this prominent reference to their services, and the recognition of them that has been won so well. No one interested in the art of cultivation, whether on farms or in gardens, can visit Rothamsted without being impressed with the magnitude of the operations there to be seen, both on the land and in the laboratory. Experiments on almost all kinds of crops with various manures, and no manures, over a long series of years teach valuable lessons. The results of soil starvation and soil enrichment are side by side. The effects of the chief chemical manures, both alone and in combination, are displayed, and it is impossible to ignore the lessons the crops teach. The laboratory work is almost bewildering in its magnitude, and the exhaustive nature and complete records of the experiments evoke surprise and admiration.

Few greater treats can be imagined to the gardener or farmer with an inquiring mind, and a desire to trace results to their causes, than that afforded by an inspection of Rothamsted in company with those who have made it famous all over the civilized world-Sir John Lawes and Dr. Gilbert. The untiring zeal of the former in the work which he instituted, and the remarkable energy of the latter, are not likely to be forgotten by the visitor. Those who appreciate the picturesque, as well as scientific and practical experiments, will find the former in the fine old Elizabethan mansion and its surroundings. Particularly noteworthy is an ancient avenue of stately Limes producing in a natural way an avenue of successors. The arms of the old trees have bent over and reached the ground on each side, and at about equal distances from the parent trunks, taken root, thrown up luxuriant suckers that are developing into straight and stately trees parallel with the originals. It is an interesting example of continuity in tree life and orderly arrangement unaided by the art of man, and is in bold contrast to the art and science which in other directions pervade the establishment. We wish, as will all our readers who have seen the work of Rothamsted, still a long period and usefulness to the distinguished veterans who were honoured last week. Rich in knowledge and experience they are still almost physically young. Dr. Gilbert will shortly start for Chicago to deliver a course of lectures, and he will not meet there many men possessing greater mental and physical activity than himself. His friends bid him bon voyage, and will be glad to see him home again.

COLOURING LATE GRAPES.

THE art of perfectly colouring Grapes of all varieties has long been regarded as one of the most difficult points in connection with fruit growing, and the cultivator who accomplishes the feat is accredited with having performed a highly meritorious achievement. As far as my experience goes it is, however, rare indeed that any cultivator succeeds in bringing a dozen varieties to this

desirable state during any one season, unless the bunches are conspicuously small, in which case the performance would not be a remarkable one, for to come up to the high standard of the present day size of bunch and berry, as well as good form and colour, must be combined.

The peculiarities of each season doubtless render uniformity of quality in Grapes difficult of attainment, because during bright hot seasons black varieties seldom finish so well or retain their colour so long as white ones, while in dull seasons the chief obstacle lies in producing the rich amber tint which denotes perfection in the latter. This difficulty is often largely increased by growing too many varieties in one house, under which conditions it is impossible to give each kind the treatment required Much has, however, been done in recent years to lessen this obstruction by planting in mixed houses only those varieties which ripen about the same time, or require similar temperatures. This, together with the special attention which has been given to Grape culture during the last two decades, has resulted in the production of a largely increased per-centage of well-coloured Grapes. Let those who are inclined to doubt this statement carry their memory back ten or fifteen years, and picture to themselves the comparatively few really well-finished Grapes to be met with at exhibitions and in high-class fruiterers' shops at that time, and then compare their mental retrospect with what they may see in similar places to-day; the result I think will be convincing. There is, however, still room for the good work already begun to be still further extended, till badly coloured Grapes, which were once the rule, become the exception. Given clean healthy Vines, not overcropped, it ought not to be a difficult matter to colour every berry which does not shank in a house in which suitable varieties are planted together, and I believe by paying due attention to the following details of culture, any intelligent gardener may succeed in doing it.

The first thing to be done is to ascertain the condition of the soil about the roots in regard to moisture immediately the berries show signs of colouring. If the soil be in the least dry, a thorough soaking of liquid manure should be given, or one of the many approved chemical manures sprinkled upon the surface of the border and watered in. On subsequent occasions, whenever the soil becomes slightly dry, water ought to be applied till the Grapes are ripe. If liquid manure is given just as colouring begins I prefer to use clear water at later waterings, except in the case of Vines growing in narrow borders crammed with roots. Ventilation is a matter which plays an important part in effecting good colour. There is, I think, too great a tendency to suddenly increase the amount as soon as colouring commences, with the result that a check is given to the Vines at a critical stage, and the prospect of securing coloured Grapes greatly lessened. It is not so much the amount of air given which requires alteration as the time of admitting and manner of reducing it. The practice of allowing the thermometer to reach a given point before ventilation is increased is not a good one. When this is done condensed moisture on the berries frequently follows, loss of bloom being the result. No matter what the temperature may be early in the morning, more air should be admitted before it begins rising, and afterwards increased sufficiently to prevent a rapid rise or decreased to avert a sudden change in the opposite direction. During the afternoon of bright days ventilation should be reduced so as to maintain the temperature between 75° and 85°, allowing a little air to be admitted through the top lights continually, and as colouring advances at the front of the house as well. These tactics should be continued throughout the finishing period, with the slight exception that as the berries ripen the air admitted may be increased in volume, which will, of course, keep the temperature throughout the day slightly lower.

It is a rare occurrence to find well coloured Grapes on Vines badly infested with red spider or other insects, yet the treatment

given by some cultivators during the ripening period is calculated to bring about a rapid spread of these pests, which revel in a parched atmosphere such as many consider it necessary to maintain during that stage. Indeed, I will go still further, and maintain that it is the one weak point which in many instances prevents black Grapes finishing well. Vine leaves which are perfectly fresh and healthy when colouring begins, after being subjected to an unnecessary amount of fire heat and but little atmospheric moisture for a few weeks, become dry, brittle, and altogether devoid of freshness, under which conditions they cannot properly perform their functions. If we take a lesson from Nature's book we find that Grapes on walls in the open air which colour during the damp cold nights of August and September usually become as black as

In order to maintain the foliage in a healthy condition, and thus promote good colour, the floor and stages of the house should be damped three times daily during bright weather, and once on dull days when fire heat is constantly employed. Houses in which Vines of Madresfield Court are growing must have less atmospheric moisture to prevent the berries cracking. The hot-water pipes should be heated sufficiently to maintain the night temperature between 60° and 65° during the next month. Later on, when colder nights prevail, it is better to allow the thermometer to fall 5° lower than to overheat the hot-water pipes to keep up a given temperature. The great consideration is to employ a little artificial heat constantly during the night and on dull days, then the exact degree of temperature kept up is not of much

All white Grapes require a somewhat drier atmosphere during the ripening period than is good for black ones, otherwise the berries became spotted, or "cloudy." Muscats should also have a far greater amount of fire heat than black Grapes. A night temperature ranging between 65° and 75° with a rise of 5° from fire heat on dull days is not too much for them. It is also important that a few of the leaves be tied aside to allow the sun to shine directly on the bunches, but this exposure ought to be done gradually, otherwise browned or shrivelled berries may be the result. Some growers advise Gros Colman to be grown in the Muscat house. In my opinion this is the wrong place for it. I have never seen perfectly coloured Colmans produced in a house in which Muscats were well grown, as the king of white Grapes requires a much greater amount of artificial heat to bring it to perfection than does the most imposing of black ones. Any cultivator whose experience differs from mine in this respect will confer a benefit upon readers of the Journal by recording it.—VITIS.

PRUNING SHRUBS—CLIPPING HEDGES.

It is well known that shrubs pruned during the winter or early spring retaliate by producing an abundant crop of shoots. True, it is often most convenient to do the work connected with shrubberies when the season is least pressing, but in my experience it generally occurs that it requires doing over again before the autumn is reached. I have seen pruning undertaken periodically during the month of April, but this is too late, as the plants operated on are made more or less bare at a season when one expects freshness and beauty. The same results accrue if pruning is delayed till too far in the autumn. There is certain to be a long-standing eyesore, ending only when new growth commences the year succeeding. I find that the month of July and the early part of August comprises the most suitable period of the year in which to prune shrubs profitably. In practice I am not particular as to the exact moment, and, indeed, the time varies according to the exigencies of each season. The chief thing to be observed is that the work be overtaken at a time when growth for the season is practically completed, so that no roughness may appear before another year. At the same time a little growth is made ensuring that fresh appearance which is so delightful in a garden.

There are, however, exceptions. Privet when employed as a hedge requires trimming more than once a year. If left till the general pruning, the growths made during the season are so strong that after being cut there is but little foliage to be seen. The plan with Privet is to cut as often as possible. I have seen it done three times a year with good effect. The oval-leaved form is, perhaps, less unsightly after hard cutting than the common sort, but I clip it also twice a year, in spring and at this period. Hedges of Taxus elegantissima also require bi-annual pruning; if left too long the green has to be cut into, and the beauty of the hedge destroyed for a time. Young Yew hedges are improved by cutting often, therefore it is wise to trim these also twice a year. Holly and Box require trimming once a year only, and if the hedges are old and large a year may be passed without pruning,

and that to their benefit. Some plants require to be treated differently than is usual with most hedges. Thus we have a long hedge of Laurustinus. To prune this with shears would be a sure means of destroying all prospect of flower the year succeeding therefore constitutions and the sure that are the sure that are the sure than the sure that are the sure than the sure that are the sure than the sure that the sure than the sure that the sure than the sure than the sure than the sure than the sure that the sure ing, therefore growths are taken out as they trespass beyond the general contour required. So also with common Mahonia. It is necessary to trim this with judgment, as both flower and fruit are beautiful. We have also a long hedge of White Spruce. This is cut twice a year. All the young growths are shorn at present, and during the spring the hedge is again looked over and

any shoots out of bounds pruned.

Rhododendrons should on no account be left unpruned later than July, and the sooner it is done after flowering so much the better. Rhododendrons may be kept in bounds and flowered profusely by cutting out a few growths every year, or every second year. These shoots ought to be cut fairly well back, so that they may break behind those left and in due course take their place when they also have grown beyond their limit. I cut in Laurels and most other shrubs in much the same way. When once a man gets into the method it does not take more time than cutting back the whole face of the shrubs, and it has the advantage of being less unsightly.—B.

SPRAYING VERSUS INSECT PESTS AND FUNGOID DISEASES.

CONTINUING my remarks from page 73, it should be borne clearly in mind that spraying with fungicides is preventive rather than remedial. The fungus cannot possibly develop upon leaves which have been treated with the concoction, as it is poison to it. This fact then gives us a good idea as to the time of application. True, the prospect of disease this year is not great, but it has made a start. The weather at present is exactly suited to its development, and there is ample time for its ravages. As we have found disease in leaves and tubers contaminating spores will soon fill the air, and to take due precaution in assisting our plants to resist the

attack is our main chance of escape.

Now is the time to apply the solution of blue vitriol and lime, choosing a dry day with as little wind as possible. On no account must spraying be commenced until the dew is off the leaf, as the mixture is thereby diluted, and, moreover, will not stick to the foliage. Two dressings, with an interval of one month, will be sufficient, and the cost does not exceed 18s. to £1 per acre for each dressing, resulting probably in a gain of at least twice that sum. A man cannot do thoroughly more than half an acre a day, unless he has a lad to fill his machine, fetch water, and assist in mixing the stuff. He should also start work with his back to the wind. dressing, when dry, should appear of a whitish-blue colour upon the leaves. For a day or so it may seem to retard growth, but experience teaches me that the vitality of the haulm is ultimately increased, hence the improvement in weight of the crop.

The efficacy of the mixture is already beginning to show itself. We have three acres of land under field cultivation, and two acres are planted with about forty varieties of Potatoes in $\frac{1}{20}$ th acre plots. At the top end of the field a long patch of "The Daniels" planted by the tenant, and these are very badly diseased. We purposely left undressed one perch of each of our forty varieties immediately opposite (a four-yard pathway intervenes) this long strip of "The Daniels." On July 26th no trace of disease could be seen on the plots, but on walking round on the 29th disease spots could be counted by the dozen upon the undressed perches of White Elephant, Surprise, Cosmopolitan, Windsor Castle, Satisfaction, Abundance, Perfection, Stourbridge Glory, Holborn Abundance, Magnum Bonum, The Triumph, and The Daniels. We searched most carefully for spots upon the dressed portion, but none could be found below the line of rods. We dressed again on the 31st as our month was up.

I may in passing give one or two practical hints in preparing and testing the mixture. Be sure and use fresh lime, and slake it just before mixing, as it then sticks so much better to the foliage; use it when warm, and pour it through the strainer of the Eclair into the tub. Never mix in iron vessels, and especially do not dissolve the copper in such, as a chemical action is involved, which gives the mixture a dirty green colour, instead of which it should be a beautiful blue (royal blue).

In preparing the ferrocyapide of potassium for testing take

half an oz. of the lemon-yello r crystals and dissolve in 5 ozs. of cold water. The solution will be ready for use in twenty minutes, and

will last for a very long time.
With regard to the dressing upon Tomato plants, it is almost too late now to apply it with safety, for fruit has in most cases formed and is ripening fast. Such plants should be sprayed before the blossoms fall, as the disease usually first shows itself upon the

older leaves. We must in fact anticipate an attack in accordance

with the season, and be prepared for resistance.

Leaf blight in the Cherry, Plum, and Pear may all be treated to advantage with the same mixture, but for fruit trees several dressings are necessary, and should all be applied before the fruit has quite set, in order that it may not be tainted and ruined in colour. The first dressing could be applied just as the leaves begin to open, and the second directly the blossoms begin to fall. When the second dose is given, 4 ozs. of Paris green added to every 50 gallons of Bordeaux mixture effectually destroys insects and grubs.

Before real progress can be made the Eclair will have to rank as one of the most important requisites of the garden. It is equally useful for insecticide and fungicide work. It ought to supersede the syringe for dressing trees upon walls with the well-known and admirable solution of quassia chips and softsoap, and it should prove invaluable in the application of kerosene and other emulsions to Onion beds with the object of scaring and finally extirpating that terrible pest the Onion fly.—EDWARD H. SMITH,

Warminster.

INSECTS OF THE FLOWER GARDEN.

(Continued from page 25.)

Our flower beds and frames furnish a home to a host of those small and singular insects which have been dignified into an order and called the Thysanura. Science has puzzled itself about their place in Nature; some would join them to the centipedes or the Crustaceans; some think them akin to crickets or dragon flies; others put them near the spiders and mites. Entomologists generally have taken no heed of them, gardeners are mostly unaware of their existence; but the microscopist rejoices over them, for the scales of these insects furnish him with very capital test objects. Formerly the whole group were also called the Springtails. This name, however, was found to be only suitable for part, as they do not all jump or leap, and so they have been divided into the Thysanura proper, and the Collembola. There are other differences, too, besides the presence or absence of the peculiar springing apparatus. All of them show a dislike to light, hence we have difficulty in getting acquainted with their habits; but the Thysanura like warmth, and occur upon dry walls, or in earth and substances not very moist, while the Collembola seem to flourish in damp places, and they suffer nothing from the effects of cold. It is the Collembola that we chiefly meet with in gardens, since they feed upon decaying leaves, or any kind of vegetable matter undergoing change, also upon some fungi, and they occur upon growing plants; sometimes they swarm in our frames, being partial to succulent species. Collembola, though from their minute size they are frequently unnoticed, infest some of the flower beds, attacking leaves near the soil, the crowns or bulbs of plants, as well as some roots, and weaken, if they cannot kill. On the other hand, it is in their favour that they help to decompose substances which become then valuable as manure.

As in all true insects, the body is, amongst the Collembola, divided into three sections—head, thorax, and abdomen; the head bears the antennæ and mouth organs, the six legs are attached to the thorax, and the abdomen has the saltatorial appendage, with its catch and spring. Some have the skin protected by scales, and catch and spring. Upon the heads of some are a number of round others are hairy. colourless points, which have been taken for eyes, but which are really organs of touch. The simple eyes are behind the antennæ, and form two little groups, one each side of the head. mouth we find a pair of fine feelers or palpi and a pair of jaws, which are long, and strengthened by horny muscles; within the mouth is a double and complicated system of teeth, which the insects use far too effectively sometimes upon young leaves and tender rootlets. Amongst these little creatures a few species occur that are blind, yet they, in spite of this disadvantage, move about with activity and decision; probably their antennæ are specially sensitive. Some species have not the leaping apparatus that most possess, which has the form of a sort of fork, having a spring and catch. When we see one of them jump, it appears to us a wonderful display of muscular force perhaps, yet it is not so much by effort that it is made as by the elasticity of the spring, and in this way force is economised. Sir John Lubbock has remarked that many people might suppose that in these insects, and in some of similar habit, the condition of inactivity was one of repose, though the muscles might be ready to move at the slightest impulse, but he thinks the position of rest is one of high tension, there is then a conflict of opposing forces, which for awhile balance each other. He takes, for comparison, the case of certain Orchids, where the part of the flower which insects visit is not close to the pollen, yet the plants depend on insects for fertilisation. In Catasetum there is found a long sensitive (process, which overhangs the place where insects are likely to settle, so that when they arrive it is almost certain they will touch it. Immediately they do this the flower starts into action, and throws its pollen masses in the direction of the insect, with such force that they will travel 2 or 3 feet. It is evident, therefore, that the plant is on the qui vive, just as an insect might be, waiting to put forth its power at the moment it is needed.

Returning to the Collembola we notice the singular fact that species which are leapers, and those which cannot leap because they possess no spring, are often to be found in company under the same piece of board or amidst a little pile of decaying leaves. More than that, some of those having the ability to jump occur in localities where leaping performances are hardly possible. The present season, owing to its dryness, has not been favourable to the increase of the insects; one who has studied their habits reports that they are speedily killed by a weak solution of salt. Smynthures fuscus, about one-tenth of an inch in length, is one of the largest of the tribe, and feeds chiefly on fungi upon trees, fences, or elsewhere. Its relative, S. viridis, which has green eyes and red antennæ, prefers lawns and borders, where it occurs from May The species of Papirius are very active, running and to September. jumping gracefully; they have globular bodies and long antennæ, in colour some are brown, some black and green. It appears that in the summer they frequent damp wood, but during the winter months they may be sometimes detected on the leaves of evergreens and other plants in gardens.

In the genus Degeeria hairs replace scales; some of these hairs are club-like, and others resemble a bow, and have even a seeming notch at the end, representing that to which the string is attached. They have sixteen eyes, and the body is prettily mottled. Upon some of the old-fashioned wooden edges to flower beds which one comes upon now and then the Degeerias occur abundantly, above and beneath the soil. Orchesella cincta is also without scales. This is a common species amongst dead leaves, which it helps to disintegrate; in colour it is black, barred with yellow, sometimes entirely black. Larger than most of its kin is Tomocerus longicornis, named from its long antenne. It is well equipped in lead-coloured scales, and can brave the cold of winter, even when severe.

The species of Seira are scaly, some of them dark hued, some have bright metallic tints; they are rather partial to conservatories and hothouses. One that is rare, called S. curvicollis, has a thorax projecting over the head, which gives the insect somewhat of the aspect of a hippopotamus. Lipura fimitaria requires no leaping apparatus, since its life is passed in feeding upon the roots or underground stems of plants; it is white and velvety, short-legged and stout, quick in movement, though we often turn up small parties of them when digging or hoeing. Quite different in colour is Anoura muscorum, being dark purple, about one-fourteenth of an inch long, dotted over with points arranged in rows (as a magnifying glass shows us), the mouth has a sucker and not jaws. It seems to lodge under the bark of shrubs, and in the joints or hollows of stems, but does not appear to be particularly hurtful. One more species I may mention which occurs in damp earth, but has a preference for the warmer corners and sides of our beds; this is Campodea staphy-linus, a soft white, narrow-bodied insect, having neither scales nor eyes, and which many persons might regard as a mite.-ENTOMOLOGIST.

EASTERN LILIES.

Under the above title, which has the merit of comprehensiveness, are included the Liliums of the Levant, of Siberia, Persia, India, China, and Japan. L. candidum, one of the most beautiful and perhaps the most familiar of Lilies, is Levantine, davuricum or umbellatum is Siberian, giganteum cordifolium is a native of the Himalayas, tigrinum comes from China, while auratum, longiflorum, and speciosum are of Japanese extraction. The American Lilies are for the most part interesting hybrids, and the Bermuda Lily, Lilium Harrisi, is just the Japanese longiflorum, as I learn from Dr. Wallace of Colchester, somewhat modified and improved in appearance and productiveness by tropical cultivation. But it is not more impressive, as experience has proved to me, than Lilium longiflorum giganteum, which comes to this country direct from Japan. This variety, though its name is somewhat similar, must not be confounded with the great Himalayan giganteum, which I must confess to have found somewhat disappointing. I planted it in a finely sheltered and otherwise congenial situation last November, and attended most faithfully to the instructions of Dr. Wallace regarding its cultivation, yet, owing perhaps to the exceptional dryness of the summer, it only attained to a height of 4 feet. It, however, produced several magnificent blooms (ivory white with violet-crimson streaks), which was undoubtedly a great consolation. Nevertheless, I think this Lily is over-estimated, when I compare it with the much more beautiful Lilium auratum or Golden-rayed Lily, which is now in full bloom. Its flowers are unusually large with me this year, being in many instances 12½ inches in diameter. Among other species that grow luxuriantly with me are candidum, davuricum, croceum, tigrinum, Thunbergianum

(or "elegans"), martagon, longiflorum, and speciosum; of the last mentioned I have several exquisite varieties, such as album, roseum, rubrum, and Kroetzeri. Of all the speciosums I am persuaded that Kroetzeri is by far the most valuable; its colour is the purest white, it is very prolific, remarkable for durability, and easily grown.

The Lily is now, even as it was in the days of William Cowper, the

rival of the Rose. If the latter is the queen the former is assuredly the empress of flowers. I admit that the Rose for brilliancy of colour and perfect sweetness of fragrance is not surpassed; but for stateliness, imperial majesty, and imposing splendour of aspect there can be no rivalry with the Lilium auratum. No flowers are more impressive in their perfect purity and beauty than Lilium candidum and Lilium longiflorum. How deeply we regret the absence of these when their season, always too transitory, has passed; when, like the last Rose of summer, they are "faded and gone." During their short-lived reign they seem to make the very atmosphere of our gardens more exquisitely pure. No picture can delineate the full expressiveness of their beauty; they have a charm of sweetness most sacred in its meaning which no pen can describe, because they are the work of a mystic ineffable art our utmost efforts fail to find.—DAVID R. WILLIAMSON.

POCKET-BOOK NOTES.

THESE jottings will not be of much account, they can be private if you like, but I thought I would write them just to say that this week's Journal of Horticulture is more than usually interesting. Some numbers are so, at least they are so to readers, if not to editors and compilers.

To begin. I enjoyed "An Anglo-American Day" thoroughly, and in imagination formed one of the very pleasant company who had such "a good day" in such an unique round of visits. "Orchids" I do not indulge in, I am a spade and wheelbarrow man, and "Spraying" has not yet become one of my round of duties.

The Rose correspondence I enjoyed immensely. It carried me back to the days of nearly forty years ago, when I showed my first Roses, large, full blown, and to me glorious, but which the Judges refused to look at, to my disgust and inward wrath. Fortunately for me a good rosarian, one of the best the midlands has produced, though only a working man, came across me in that state of indignation, and he most kindly but faithfully, very faithfully, as I felt at the time, showed me where I was wrong, and that Roses should be cut and staged in all their maiden leveliness. Or as Mr. Charles I Grahame gays page 73 quoting where I was wrong, and that Roses should be cut and staged in all their maiden loveliness; or, as Mr. Charles J. Grahame says, page 73, quoting from the N.R.S. definitions of a good Rose, "in the most perfect phase of their possible beauty." The lesson I never forgot. I trust Mr. David R. Williamson may be as benefited by the plain speaking of his brother rosarians as I was. Through a long life I have found that these friendly rebukes, though at the time somewhat hard to bear, are the best things that could come to us.

"Parsley for Winter and Spring" is a timely little note. I always sow a frame, or part of it, of nine lights in which I grow my earliest Potatoes, with Parsley about midsummer, and the other part with Lettuces, &c., for winter a little later. This gives me an unlimited supply of Parsley all through the winter and spring. A friend and neighbour of mine always throws a pinch or two of Parsley seed about August on the soil of his orchard house, and thus gets over the difficulty of a scarcity of it in a hard winter.

"Notes and Gleanings" I usually read first, and this week one of them gave me a shock, for, though a near neighbour, I had not heard of the illness of Mr. Pithers of Chilwell, and the news of his death startled me. I can emphasise all you say of him and more, for he was one of the pleasantest of companions, not only in a gardening tour round his beloved Chrysanthemums, but also in a friendly professional confab with a few gardening cronies. Amongst these he could let himself out and give and take with the keenest enjoyment.

"Scarlet Runner Beans Not Setting." This fact is rather prominent this season, and I think we must look to the absence of bees to account for it. I have amongst my gardening scraps notes of a paper by Professor Henslow given some years ago, in which he demonstrates quite plainly that this family of Beans must be pollenised by insect agency in this country, or they will be inevitably barren; the construction of the flower making it so. This was only the case with respect to the Runner Bean, the form of the flower of the Dwarf Bean being quite different and self-fertilising. The subject is worth discussing.

In 1855, in Sir Joseph Paxton's days, I made the same journey from Sheffield to Baslow and Chatsworth which "W. P. W." did, and I enjoyed going over the old route with him, in his visit to Chatsworth, our "Palace of the Peak." I have never forgotten that visit and never shall, and, though "W. P. W." has seen, and will see, many other gardens, I do not think he will see another Chatsworth. By this, he and you will see that one person enjoyed reading pages 80 and 81 and you will see that one person enjoyed reading pages 80 and 81.

I must not go on, though the reports of the shows are deeply interesting, that of Trentham very much so. Reports of shows have a

tendency to become monotonous and wearisome, but those of the Journa of Horticulture are exceptions, inasmuch as that the Editor allows the personality of each reporter to appear more fully and pronouncedly than do the Editors of other gardening papers. The blue pencil does not dash out all original expressions of opinion, thus leaving the report as if done by a machine, and therefore there is in their reports a freshness and brightness often absent in others.—P. H. N.

PECULIARITIES OF APHIS LIFE—EAST WINDS.

I BEG to thank "Entomologist" for his note on this subject, on page 505 of the last volume. He is quite right in presuming I spoke of A. Pruni as the Plum aphis, although there was some difference of opinion as to the species when I introduced them at a meeting of fruit growers at Evesham, in February, 1890, from Prune Damson trees growing in an exposed orchard. A gentleman who had a copy of Mr. Buckton's excellent work wrote me afterwards confirming my opinion. It cannot be too deeply impressed on the minds of fruit growers that these mothers of millions in future generations are exposed on the unopen buds at the base or neck, taking their nourishment at the only vulnerable point of attack, and that applications of strong insecticides will not injure the buds at that time. I have tried experiments on some trees, leaving others untouched, and as the seasons advanced the contrast was most marked. I do not, of course, deny that aphides take flight when at maturity, and spread themselves to "fresh fields and pastures new;" but the general or popular delusion that they come from some mysterious place in the "east winds" is exploded, so far as I am concerned. Many I have seen on flight on a warm still day, and the wind south-east; but the source is not far to seek on examining the back of the foliage of Plum trees.

As an illustration as to the popular idea respecting this kind of blight, perhaps I may mention one case which came under observation about a month ago. A man who has a few acres of orcharding called on me. I asked him about fruit prospects, and his reply was to this effect, if not in exact words, "Oh, the Plum trees are all 'shrimed' up with blight, and the bloom all fell off. I wish you would come and see them, and tell me what I am to do." I said it was too late to do much good, as the aphides were then inside the curled foliage. If he had attended the lectures in the village in February and March and seen the mothers on the buds and specimens under the microscopes as others did, and took action, he could easily have counteracted the attack to a great extent, if not entirely. As usual in such cases he commenced blaming the "east winds" in spring, yet, as everybody knows, we had less east wind and so-called "blight clouds" and more blight than usual, on account of the warmth and dry weather. I then pointed out Plum trees on walls east, west, north, and south all free from blight, or nearly so, saying at the same time if east winds were the cause surely it would have caught some of them. I next called his attention to the streaks of lime, soap, and petroleum below the branches, the residuum from the spring dressing, as the preventive to the "east wind" notion and where blights come from. I then took him into the house and showed him the viviparous mothers and their families of young wingless aphides in all stages of growth, remarking at the same time they could not have come in east winds, as they had no wings to fly with from the mysterious unknown source. As this was his first acquaintance with a microscope he was much interested in the matter. At my leisure I gave him a call (three miles away), and found his orchard and garden trees in a sad plight from aphides and caterpillars of the winter moth. He called my particular attention to a Hawthorn hedge, which was blighted and brown as if scorched with fire for a distance of about 20 yards, he asking how I could account for that. I took off a few shoots with the curled foliage, and showed him the caterpillars in the rolled leaves as they came tumbling out on being stirred. I again referred him to the east wind notion and blight, pointing out that almost to a foot the hedge was protected from the east winds by buildings where it looked so bad, and that the moths when laying their ages much have been very coreful not that the moths when laying their eggs must have been very careful not to expose themselves and their future progeny to its influence, and that the surrounding hedges exposed to east winds were free from blight.

There is another popular idea respecting aphis attack that I do not agree with, over which I have had many contentions in a friendly way with some of the best gardeners—viz., their preference for unhealthy trees and plants. My experience is that they "go for" the best and most succulent, and that by degrees they bring the plants into the bad condition by sucking the sap to such an extent as to bring them into a decrepit state before they are noticed, or before steps have been taken to save the plants or trees. The worst attack I have met with from Aphis pruni I can safely say is at the Toddington fruit plantations, and I sincerely hope experiments will be made early next spring with Messrs. Stott's killmright at the right time before the bloom is open, dressing alternate trees or definite lines, leaving others, and I have no doubt as to results in the following summer.—J. HIAM, Astwood Bank.

NOTES FROM IRELAND.

THE Royal Botanic Gardens, Glasnevin, two miles north-east of the city of Dublin, are of easy access by tram which passes the gates, before reaching which, Prospect Cemetery, bounding the gardens on the south is passed. A conspicuous landmark is the lofty monumental tower marking the last resting-place of O'Connell. In the Botanic Gardens many fine and rare trees and shrubs stand as memories of the late curator

Dr. Moore; the same good work is carried on and kept up to date by his son, the present curator, pro bono publico, and how much the public avail themselves of the privilege statistics show by the ever-increasing number of visitors, though you may be stopped by the official-looking janitor at the gates and bid inscribe your name in the book. This time I slipped in unchallenged, but was immediately arrested by a fine Paulownia imperialis with a grand timber-like trunk; this would be worthy of a special visit when in flower, but I fear that, as in England, spring frosts are its bête noir.

Hunting up Mr. Moore's lieutenant, whom I had met a few hours previously at the Royal Horticultural Society's Summer Show arranging one of those fine groups which so materially aid our exhibitions, we enter the new Palm house, 100 feet long, 60 feet wide, 66 feet high, well furnished with fine specimens. One notable example of the Sago Palm sweeps up to the roof, and as I look up the 66 feet, Mr. Pope looks back on forty years and speaks of the time he had carried it himself from one house to another. Very noble, too, is a giant Bamboo rivalling the Palm in height; here also are the Browneas, not now in their gorgeous inflorescence. The abrupt ending of this house in a heavy wall is not a pleasing coup d'æil, but Begonias and the Monstera are at home on it and Tradescantia very much so.

From here we enter the Fern house where, amongst the many plants, Davallia Mooreana, 8 feet through, stands pre-eminent, and the quaint Conifer-like Lycopodium squarrosum from the Himalayas claims attention. The next division contains Orchids, including some large Sobralias, of which xantholeuca is in flower and also the deep rich Cattleya Sanderiana. Cypripediums are largely represented. Parrishi is fine, and very pretty is Trichopilia Wagneri with pale green sepals

and white lip.

The curvilinear range, 350 feet long in five divisions, contains a vast collection, that of Bromeliads being the largest extant. Succulents, too, are in vast array. Napoleona (Bonapartea) imperialis is a fine Citron-foliaged shrub with a Passion-flower-like blossom, and very pleasing are the soft pale yellow blossoms of Bignonia Chamberlaini. Illumining a back wall in one division is the golden Cassia lævigata. Leaving this range the aquatic house comes next, where the Victoria regia rightly holds sovereign sway, whilst floating round the outer leaves Pistia stratiotes, the Water Soldier, acts as a guard of honour to the Water Queen, a small overshot wheel fed by a pipe keeps the water in circulation; huge plants of Caladiums, exceptionally fine, stand on the edges of the tank and side stages, and Nymphæas rosea and coerulea are in beauty inside and outside in an overflow tank; near this house is one devoted to tree Ferns.

Entering the private grounds "Mums" (unworthy abbreviation, why not Chrysanths?) are in strong force, and call forth some notes of admiration from me while my guide strikes a discordant one by asking, "Are they worth the trouble?" But he regards with such an air of fatherly affection the sturdy brown legs of his 600 children that I conclude without resorting to the argumentum ad hominem that we are both on the one side. In the private houses is a fine collection of Odontoglossums and Masdevallias. Mr. Moore has an army, some in flower, more curious than handsome, and though it may be heresy to say so, here in the cool temperature is the prince of Pitchers the Rajah, the only plant in Ireland. Alas! that it should be so. To describe "His Highness" I should say that he is short and stout, yet withal having a dignity quite his own, holding the same position in the great family of Nepenthes that the Eastern potentate does to his subjects, an idea helped out perhaps by the "gobble you up" appearance of the brown - hued pitchers, hence perhaps the reason for guarding a magnificent Cephalotus with a bellglass, and preventing a catastrophe. Darlingtonias and Droseras are en masse. A house of Filmy Ferns is fine, with grand Todeas, a cartload of the Killarney Fern, and many choice Hymenophyllums. Another house is filled with choice Zonal Pelargoniums and Tuberous Begonias over which my friend lingers lovingly, but I have trespassed long enough on his time, two hours have slipped by all too quickly but very pleasantly.—E. K.

SOBRALIA LEUCOXANTHA.

This beautiful Orchid does not appear to have become very plentiful yet, judging by its non-appearance in many collections, notwithstanding that it has been known to specialists for some years. The plant is dwarf in habit, the slender stems 1 to 2 feet high, bearing plicate leaves like those of other better known Sobralias, and the flowers are clustered near the apex of the stem. It is related to S. macrophylla, but must not be confounded with S. xantholeuca, also a valuable and handsome plant bearing pale yellow flowers.

When well grown the flowers are really handsome. The sepals on some blooms I have are nearly 3 inches long and 1 inch broad, massive, pure white, and recurving. The petals are of similar length and breadth, slightly recurving, not quite so thick as the

sepals, but pure white. The lip is partially tubular, the tube 2 inches long, the limb rounded one-half to three-quarters of an inch across, and beautifully frilled, rich orange, yellow in the throat fading to the margin, which is pure white; the base of the lip and the column are also white. Each flower is very neat in form, the wax-like substance and purity being beautifully relieved by the dash of orange in the lip. An illustration of this charming Orchid would doubtless interest your readers.—Specialist.

[The engraving (fig. 15) depicts a bloom of Sobralia leucoxantha.]

NEW ORCHIDS.

Among other interesting features of the July number of the "Kew Bulletin," a copy of which has come to hand, are some notes on "New Orchids." Ten species that have flowered at Kew or

FIG. 15.—SOBRALIA LEUCOXANTHA.

have been determined there are described, and as being of special interest to our readers we extract the four notes which follow this paragraph.

POLYSTACHYA IMBRICATA.

This species was sent by Mr. J. O'Brien of Harrow-on-the-Hill, Middlesex, with whom it flowered in August, 1891. It may be placed near to P. ensifolia, Lindl., which, however, has much longer leaves and a lax inflorescence. There does not appear to be any species with which the present one can easily be confused. The sepals are pale yellow, the lateral ones suffused with pink along the margins; the petals straw colour, and the lip pink, with a yellow callus, and wholly pubescent inside.

ONCIDIUM LUTEUM.

This Oncidium flowered in the collection of Sir Trevor Lawrence, Bart., Dorking, in June, 1892, when it was sent to Kew for determination. It is closely allied to O. chrysopyramis, Rchb. f., but that species has invariably a broader isthmus to the lip, and a few other structural differences which seem to indicate the distinctness of the present one. Its flowers are uniformly light yellow, and borne in a large lax panicle. It belongs to a group of species in which the column and its elongated rostellum resemble the head and beak of a bird, from which one of the species, O. ornithorhynchum, Kunth, derived its specific name. Lindley distributed the species into four or five different sections, but they are so intimately allied as to leave no doubt of their forming one natural group, which may bear the name Rostrata (a name used by Lindley in a more restricted sense). About twenty species have been described, but several of them are still very imperfectly known.

HABENARIA CINNABARINA.

This species was introduced by Messrs. W. L. Lewis & Co. of Southgate, together with Disa incarnata, Lindl., and Cynorchis grandiflora, Ridl. The colour of its flowers is rather unusual, being cinnabar-orange, with a few red spots on the back of the sepals, and thus resembling those of Disa incarnata from the same locality. The plant here described has nine flowers and buds, but appears as if very imperfectly developed, and normal specimens may be much larger. It is very different from everything hitherto described from Madagascar, so far as can be discovered, but its exact affinity remains a little doubtful.

LUISIA AMESIANA.

This species was sent to Kew by Messrs. Hugh Low & Co. of Clapton in June, 1891, who state that it was imported together with Vanda Kimballiana, Rchb. f. Thus its habitat must be on the hills of the southern Shan States, at 4000 to 5000 feet elevation. Shortly afterwards it was sent by Messrs. F. Sander & Co. of St. Albans, who gave its native country as "Burma." It has since been received from Glasnevin. It is allied to L. macrotis, Rchb f., but has flowers more than twice as large. The sepals and petals are pale yellowish white, slightly suffused with purple near the apex, and having a few obscure dull purple markings on the back. The lip is suffused with purple, and blotched with dark purple, the margin being light greenish yellow. The column is pale green.

ORCHIDS IN THE OPEN AIR.

As many readers of these pages are aware, Orchids have for a long time formed a special feature at The Grange, Carshalton, the residence of A. H. Smee, Esq., whose name is well known in horticultural circles, and on a recent visit to "My Garden" it was seen that the enthusiasm in this respect had by no means abated. Mr. Smee is apparently as fond of his Orchids as he is of his fruit, and in Mr. G. W. Cummins he has an able cultivator. Several houses are devoted to Orchids, and a large collection has been brought together. The plants, moreover, are for the most part remarkably healthy, and when in flower doubtless produce a bright effect.

The most noteworthy feature in regard to the Orchids at "My Garden," as Mr. Smee terms the beautiful grounds attached to his house, however, is the fact that hundreds of them are grown in the open air during the summer. This is not news to old readers of the Journal, inasmuch as references to this fact have frequently been made, and an illustration appeared in the issue for October 30th, 1884, demonstrating clearly the method in which the Orchids are managed. Much the same exists at the present time, and a sojourn outdoors for a few months proves so beneficial to the plants that Mr. Cummins adopts the plan every season. It must not be imagined, though, that everyone "may go and do likewise." Were such the case it is very probable that thousands of Orchids would annually collapse, for, notwithstanding that some species are easy to manage under glass, they quickly resent any sudden and extreme climatical changes. This, of course, is known to most Orchid growers, and, therefore, it is not at all surprising that they are sometimes slow to adopt new ideas in preference to oldworld plans. But, as already remarked, it has been proved that Orchids can be grown outdoors during the summer under favourable circumstances.

In the garden alluded to there are facilities that cannot be found in every establishment. "My Garden" is charmingly situated, being well watered and intercepted by several small streams from the river Wandle. Dells and winding walks exist, and these, being covered with a canopy of foliage, form excellent places for the plants. No drying winds and scorching atmosphere, the bane of Orchids, can reach the plants. On all sides Ferns luxuriate, and the plants are placed on open lathed platforms directly over and at about a foot from the water. Several hundreds are subjected to this treatment, and the whole of them appear to revel in the cool moist surroundings. In one dell, amidst trees which afford abundance of shade, we find a collection of Masdevallias, some of which are in flower, whilst in another part of the garden may be seen a group of Odontoglossums in variety. Lycastes, too, and numerous cool-house Orchids are placed in the positions indicated during the summer. Most of the plants present a healthy appearance, so different to the sickly hue which is a characteristic in those kept under glass during scorching weather.

All kinds of Orchids are not, however, subjected indiscriminately to the open air treatment. Years of experience have taught Mr. Cummins what plants will do well under such circumstances, and those that will not. The latter are kept under glass, together with the kinds that require a warmer temperature than can be obtained under natural circumstances in this country, even during an exceptionally "favourable" summer. In the latter category we may place Cattleyas, of which the best and most choice forms are

grown. Last week several were in flower, including the beautiful C. Mossiæ Hardyana. Cypripediums are well represented, and the same may be said of other Orchids. Arranged in a charming fernery many of them make a fine display when in bloom.—C.

NOTES BY THE WAY.

There are pleasant examples of English scenery around the little Sussex town of East Grinstead, north of which lie the Surrey hills, east Ashdown forest, and southwards the South Downs; there is therefore little wonder that the locality has tempted many wealthy Londoners and others to establish estates in its vicinity. The breezes which sweep down from the forest are robust and invigorating, carrying, perhaps, a little ozone from the salt waters lying some twenty-five miles beyond them. Possibly they are a little too convincing in the winter and spring, but even then their influences cannot be very malevolent, otherwise there would be something less significant of healthfulness than the death-rate of under ten per 1000 to which Grinsteadians now proudly point. For these reasons, not less than for the fact that there are many places of interest in the neighbourhood, horticulturists of a wandering turn may do far worse than spend a few days in the little town near the Surrey border.

There was a time when a gardeners' society existed there. Neighbouring blue aprons lifted up their voices in instructive intercourse with their fellows, shook their heads sagely over knotty problems, pulverised trembling opponents with eloquent invective, and brought examples of their skill as ramrods to drive home the bullets of argument. Where is that Society now? Why is the council chamber empty; the Demosthenes and Ciceros of the locality silent; and all things in a state of stagnation? I visited Grinstead in days gone by, and there was talk of meetings and shows, of papers and discussions, of competitions and medals—everything, in fact, to stir up gardening talent and give gardeners something special to think and talk about as well as to work for. I return; and, lo! the meetings are no more, the papers unwritten, and the cobwebs settling down upon the brains of the orators. It is a sad change, and it is natural for a visitor to wonder what has brought it about.

But wondering is not knowing. Trouble appears to have arisen in various ways. The excellent President, Mr. George Truscott, took unto himself a wife, and fixed his quarters in the neighbouring county. Another official took something else and also quitted the scene. Active members became disgusted with the supineness of the majority, and it is a fact worth noting that the greater number of the members of most associations consider that those who are willing to work for it and them are honoured by being allowed to do so. From these and other causes things went wrong, and the end of it was that the Society's affairs were wound up, and its career of usefulness terminated. Gardeners of Grinstead, this is not well. When Greece fought Troy she lacked the services of only one of her great warriors, but here all play the part of Achilles, and there is no one to carry on the work so well begun a few years ago. If there were no good men in the neighbourhood this state of things would not be so surprising, but there are numerous fine places and practical men, besides the usual complement of cottagers and amateurs.

There is Dunn of Oakleigh, a smart young gardener and generally intelligent, cut out for a secretary if there ever was one; Simmons, gardener at Mr. Murchison's beautiful place, whose speeches are still talked about; Glen of Brambletye, a canny Scot, whose native shrewdness has been sharpened up by a sojourn amongst the Yorkshire Tykes; Draper of Plaw Hatch, a gardening Lawson in his mixture of wit and wisdom; Harris of Hammerwood, a first-rate vegetable grower; Jupp of Felbridge, whose Conifers are something to be proud of; Boland of Imberhorne, whose special qualities I have had no opportunity of finding out; Prentice of Paddock Hurst, about whom I am equally ignorant, and quite a number of men in smaller places. Here is material enough for a practical set of officials and working committee to begin with. Why do they not set to work and make a fresh start? With a long pull, a strong pull, and a pull altogether the Society could be put on its feet again. Who is going to take the lead?

Mentioning these gardeners and their places suggests to me that a few jottings about them may be of interest. I will not study any order of precedence nor attempt formal reports, but make a few random remarks about them as they come, beginning with Oakleigh. This is the residence and estate of Sir Francis Wyatt Truscott, ex-Lord Mayor of London, prince of printers, director of railways, and otherwise a very prominent figure in the higher City circles. His house is a delightful one, standing on high ground and commanding a splendid view of the surrounding country. The establishment might almost be termed a model one, every department being in admirable order. The work of development and improvement has been carried out on substantial lines. There has been no jerry-building or cheap-jack fitting, but everything looks solid and enduring. The fields are well fenced, the cottages handsome and well built, the stables, outbuildings, and garden walls thoroughly constructed, the vineries, Peach houses, and garden fittings generally of the best type. It is quite clear that Sir Francis is a firm believer in good work, not caring for tinsel and flashiness.

If there is one thing in the gardens likely to interest gardening visitors more than another it is a splendid fruit cage constructed against the northern wall of the kitchen garden. About the wall itself there hangs a story. Though substantially put together it is much exposed, and a considerable portion of it was blown down by a terrific hurricane two or three years ago, carrying with it, of course, the promising line of cordon trees which Mr. F. Dunn, estate manager and gardener, was beginning to look upon so proudly. Pride goes, we know, before a fall; in this case it was the wall and not the grower of the trees who came to grief, but no doubt he sorrowed extremely for all that. All good gardeners grieve to see evil come upon the property of an esteemed and respected employer as much as they do upon the week of their own handiwork. The wall fell, like the society before referred to, but Oakleigh knows no failure. In a short space it rose again, better and stronger than before, fresh trees were planted, and once more the chest measurement of the gardener increases as he gazes upon it.

I return to the cage, which is really something out of the common and worthy of special attention, for such a fixture would be of the and worthy of special attention, for such a fixture would be of the utmost value in any garden. It is 216 feet long and 12 feet wide. The wall is 12 feet high, and from it projects a glass coping 2 feet 6 inches wide; the cage arching gracefully from the coping to the ground. These figures will show that it is spacious, and "cage" is perhaps hardly the word to apply to it, especially as the birds have no chance of becoming acquainted with anything more than the outside of it. Two-inch galvanised iron piping, painted black and fixed beneath the front of the coping, constitutes the supports, and angle iron arches perforated for the strand wires sustain the covering, which is of \(\frac{3}{4}\)-inch mesh wire netting, the strand wires being about a foot apart. There is a netted door at each end, and completeness is added by the spouting connected with the coping, by which rain is conveyed to a pipe emptying itself into a tank in one corner.

The advantages of such a structure as this are pretty obvious. The smallest bird which British fruit growers have to contend with has no chance of scraping its hungry body through the netting, nor can the most wily member of the feathered tribe imitate the small boy outside the circus and gain admission by crawling under. It is clearly a case of "no admittance" to thrush and blackbird, sparrow and finch. Wasps are not debarred of course, nor moths and other egg-laying pests, but all such have a watchful enemy. Moreover, the coping acts as a protection to the wall trees. One improvement, and one only, suggests itself, and that is to have this moveable, so that it might be raised to admit genial showers to the border. A batten path is provided, which can be readily removed to permit of cultural operations and does away with the disadvantage of a hard, trodden walk.

A large amount of choice dessert fruit may be grown in a cage such as this. On the back wall at Oakleigh is a collection of cordon Pears and Plums, flanked by an Apricot cropping heavily at each end. The cordons were planted in October, 1891, after the rebuilding of the fallen wall, and have made remarkable progress. But they have been well treated. The soil was removed to a depth of about 2½ feet, and fresh loam resting on a foundation of lime rubbish was substituted. The trees were planted firmly 18 inches apart, and well mulched. No manure was put in the soil. The result is that they have made free but fruitful growth, and are now bearing good crops. The Plums but fruitful growth, and are now bearing good crops. The Plums—Jefferson's, Cox's Emperor, Peach, Washington, and Prince Englebert—are full of fruit. The Pears comprise Thompson's, Duchesse d'Angoulême, Zephirin Grégoire, Doyenné Boussoch, Beurré Bachelier, Doyenné du Comice, Bergamotte Esperen, Calixte Mignot, Beurré d'Anjou, Clapp's Favourite, Beurré Diel, Beurré Superfin, Princess, Glou Morçeau, Pitmeston Duchess, Louise, Benne of Jersey, General Teddleben, Jersey, Pitmaston Duchess, Louise Bonne of Jersey, General Toddleben, Jersey Gratioli, Vicar of Winkfield, Beurré Alexandre Lucas, Maréchal de Cour, and Durondeau-by no means a bad selection.

The front portion of the cage is devoted to choice Cherries, Gooseberries, and Currants. Cherries of such varieties as May Duke, Late Black Bigarreau, Black Tartarian, Elton, Early Rivers, Royal Duke, and Bigarreau Napoleon are trained to the angle iron supports; and Gooseberries are being trained toasting-fork fashion up the netting. A row of Gooseberries is planted behind them, and further in the interior is another row, planted alternately with Black, Red, and White Currants. At present these are young bushes bearing light crops, but when they have filled their allotted space they will give a very acceptable supply of fruit. So much satisfaction has the fruit cage given that there is talk of erecting another one against a wall with a west aspect. If this sort of thing goes on it will be bad for the neighbours, as the birds will flock to them in disgust.

The Oakleigh gardens are in excellent order throughout, and Mr. Dunn need not be afraid of his work being seen. The Peaches and Vines are particularly well done, being a wonderful contrast to the condition they were in when I saw them on his taking charge five years ago. They are now well furnished with healthy growth, and bearing excellent crops. The early Peach house, in which are two large trees of Barrington and Violette Hâtive, have yielded magnificent fruit, which, if exhibited, would have taken a great deal of beating in the best company. The rejuvenation of the trees shows how plastic Peaches are in skilful hands. The outdoor fruit is also well managed. Apples, Pears, and Plums are all cropping admirably. One walk in the kitchen garden is

lined with rows of cordons, a substantial erection being provided for their support. It is high enough to give them a good run, and they are doing all the better for it. The restriction principle is often carried to such an extent as to starve the trees into comparative barrenness. More Grinstead gleanings another week.—W. P. W.

NATIONAL ROSE SOCIETY.

As inquiries have reached us as to the character of the circular recently issued by Mr. C. J. Grahame, owing to the circular and envelope being headed "National Rose Society," we think it should be clearly understood by our members—1, That Mr. Grahame has resigned his position as a member of the Committee. 2, That the document in question has no official sanction whatever.—H. HONYWOOD D'OMBRAIN, EDWARD MAWLEY, Hon. Secs.

MR. GRAHAME'S QUESTIONS TO ROSARIANS.

In order to obtain the views of as many members of the National Rose Society as possible on certain subjects which have been under discussion for some time past in regard to the Society's arrangements, Mr. Charles J. Grahame has posted the following questions to a number of gentlemen with a request to be favoured with early replies.

1, Do you think the annual Tea Rose Show at the London Scottish Drill Hall, Westminster, advantageous or otherwise to the Society and

its exhibitors, and would you maintain or abolish it?

2, (a) About what date do you consider best for our annual Metropolitan Show? (b) Do you think Saturday the best day on which to hold that meeting, or do you think the exact day of the week immaterial?

3. About what date do you consider best for the Provincial Show, bearing in view that this meeting should be fixed chiefly to suit growers in late districts.

4 (a) Do you think two Metropolitan Shows of equal importance would be preferable to the present arrangement of a Metropolitan and Provincial Show? (b) Or if the arrangements for the two shows be left as they now are, would you divide the prize money more equally?

5, Do you think it would be desirable that candidates for member

ship in our Society should go through a form of election?
We suspect the replies will be "varied and interesting."

FRAGRANT ROSES.

PERHAPS there may be, as Mr. Williamson asserts, page 73, "unquestionably a strong and growing aversion to inodorous Roses," but if so, I do not think it influences to any extent the exhibiting Rose-grower. For thirty-five years I have been a grower of Roses, but amongst the hundred that I may cut every few days, how rarely do I do more than hold my pets in different positions and fill my eyes with their beauty. When I do feast the prominent feature of the face with its perfume it is generally some Tea or bloom of La France that, watered by the dews and showers, has refused to further unfold its charms. To break off at the inscrtion of the petals the whole unexpanded bud, and tearing it in two from the base, is indeed a surfeit of fragrance, which, as far as my experience goes, no beautifully expanding bloom ever

Many years ago one of the Rose elections I conducted was on the point of fragrance. I recollect that, in my innocence, I felt certain that the old Cabbage must head the poll, but very few of the voters appeared to be cognisant of its existence, or, if they were, disliked its perfume. There is something in antipathies even as regards scent, and the old Latin proverb, tot homines, surely applies; and I recollect one reply stated that the perfume (?) of Duke of Edinburgh was to him perfectly disagreeable. As a rule as for as my passi organ guides me perfectly disagreeable! As a rule, as far as my nasal organ guides me, and being decidedly prominent I follow its guidance, the dark H.P.'s are the most fragrant, and amongst these Pierre Notting is to myself the most agreeable aroma. La France and Augustine Guinoisseau, both classed as H.P.'s, have undoubtedly a Tea taint. What a description! as if there could be a taint of Tea? But in some of the Teas the astringent tinting is too powerful for some persons to allow the fragrance to be altogether an agreeable perfume.

At that perfume election I recollect that Mr. Curtis's remarks, which were printed in full in the Journal, were most interesting, and showed an amount of discrimination in fragrance which would tax most of us to emulate. In conclusion I would ask, Why need our most of us to emulate. In conclusion I would ask, Why need our interchanges of thought on Rosc matters be as thorny as some of our favourites? and if some of us prefer to write under a nom de plume where is the harm? Many of these are as well known as though they signed their names in full. Who does not know "D., Deal," "E. M.," "A. C.," and in bygone days "Wiltshire Rector" and "Herefordshire Incumbent?" Are all these, including your humble correspondent, to be ruthlessly anathematised because we prefer to write and perhaps offer advice under a nom de plume? Why should our non-exhibiting friends sneer at the N.R.S.? That Society has done much for Roses,

and although the exhibiting division may have been in at the birth I do not think they despise or look down on the lovers of garden Roses. With many of us it is by no means a disregard for their beauty; it is indeed the impossibility of doing both from want of room. That, at least, is my case; otherwise I should delight in having my old favourites "looking in at the window," rambling in their own sweet luxuriance and graceful charms. -Y. B. A. Z.

ROSES AND ROSARIANS.

In reply to the latest contribution to your columns of "A Jubilee Rose Grower" (page 73), allow me to say that so for the say that (page 73), allow me to say that, so far as I can remember, I have never allowed my judgment, when writing on horticulture or any other subject, to be biassed by the influence of personal friendship; nor in my articles have I consciously over-estimated any personal friend. It is gratifying to believe that the generous hope of "W. R. Raillem" may be realised, and as amusement is often beneficial I trust my contribu-tions to the "Rose column" will not be without wholesome effect on the minds of the more serious section of correspondents.—DAVID R. WILLIAMSON.

[Mr. Williamson is not a literary dry-as-dust, and we should be sorry for him to become one. Writers who can combine pleasure with instruction are public benefactors.]

I HAD not noticed "Audi Alteram Partem's" letter, page 51, in the Journal in more than a very casual way. With "W. R. Raillem" I have frequently been amused at the way "Rose-growers of taste" (as we must accept "A. A. P.'s" description of himself and Mr. Williamson as gospel) write on Roses. Mr. Mawley and "W. R. Raillem" have let down these gentlemen fairly easy, the former giving the practical part of the story about the catalogue, and the latter vivisecting the "Rose-growers of taste" in a way that I trust they will thoroughly enjoy and appreciate.

I shall look forward while on my holidays in the next few weeks to enjoying further letters in the Journal replete with "fresh observations" on horticulture from these gentlemen who are "true lovers of plants and flowers," and by the sad sea waves I may reflect on the year we rosarians, who are unfortunately exhibitors, have wasted in following a "will o' the wisp," or even, to give it a worse name, a "chimera" which can never help us to become "keenly alive to what is beautiful in nature."—CHARLES J. GRAHAME, Croydon.

JUDGING.

I THINK Mr. Grahame (page 72) is a little hypercritical in objecting to the words "more variety," as applied to a stand of Roses. I think we should all understand it as alluding to colour, and that it is quite a legitimate expression. One man may show a stand of twenty-four, or thirty-six blooms for the matter of that, all of red H.P.'s, while another

with a good sprinkling of Teas, especially yellow ones, as well as light H.P.'s, would surely show "more variety," though not "more varieties."

I confess I do not like to hear of a "weighty" stand or "heavy" blooms, though I fear I am becoming used to it. It seems rather like bringing Roses down to the prize goose level, but I do not think it is as bad as it sounds. It is not mere "size," but implies fulness and stout

thick petals as well, for size does not necessarily involve weight.

As to "freshness," which is distinct from colour, though rather difficult to define separately, has not Mr. Grahame rather overlooked the words of his own quotation from N.R.S. rules, "Where flowers are of equal merit judges shall consider arrangement, freshness, &c.?" I have never found a judge who in such a case would refuse to consider "arrangement;" but, of course, he might say that "freshness" had already received its due meed in points in comparison with the standard, for they would necessarily be pointed where of equal merit.

In two or three instances where I have been judging this year the points have been equal, and "arrangement" has settled the matter, to the satisfaction of all concerned. In these cases "freshness" would already have been estimated in the pointing.

Considering the great distances they have to travel, both Messrs. Dickson and Messrs. Harkness, the former especially, have to be congratulated on the freshness of the blooms they have staged. surprised to see that the fine stand of herbaceous flowers with which Messrs. Harkness won at Woodbridge travelled entirely uncovered, yet lost none of their freshness. In a dusty time I should think this was impossible. I understood that the point was that railway officials took more care of the flowers when they could see them.—W. R. RAILLEM.

METROPOLITAN EXHIBITION OF THE NATIONAL ROSE SOCIETY.

WHEN we remember the fierce controversy which fluttered the rosarian world last autumn it was instructive, not to say amusing, to see the "flattened" condition of the advocates of the later date, for long before the day arrived it was clear that most of the exhibitors from early districts were entirely hors de combat. When I met Mr. R. G. Baker, the former champion of the Rose world, who it is well known hails from Exeter, and asked him if he had any Roses, "No," was his reply, "mine were over weeks ago;" and, with very few exceptions, the same may be said of most southern growers. True the season has been an extraordinary one and none of us may over goo its like same has been an extraordinary one, and none of us may ever see its like again, but it is just these possibilities in our uncertain climate which should incline us to a date which a long series of years has on the whole proved to be

It is always more pleasant to record success than failure, but still the truth must be told, and I think it may be safely averred that, with the

exception of the disastrous year of 1879, when the smallness and poverty of the exhibition from a totally different cause—namely, the excessive wet—the N.R.S. never held a poorer exhibition. The number of Roses exhibited, of which, however, I have no accurate account, appears to have been some 2000 less than those exhibited last year, and in consequence the competition was not near so keen, and in some classes even there were not enough stands for the prizes offered. This falling off would be naturally more conspicuous amongst amateurs than nurserymen, who, from the large quantity that they grow and their different localities, have a better chance of making up a good stand, and hence, with the exception of some stand amongst the Tea Roses, the standard of excellence was considerably lowered. As was anticipated, the cooler climate of Yorkshire and the copious rains that they have had there helped forward Messrs. Harkness & Sons of Bedale, who carried off with flying colours the much-coveted challenge trophy. There were in their stand of seventy-two some grand blooms. The Horace Vernet, which gained the silver medal, was a grand flower, of fine build, great substance, and brilliant colour. Almost as good, if not quite so, was a beautiful bloom of Dickson's Earl Dufferin; in addition to these there were some splendid flowers of Comte de Raimbaud, Victor Hugo, Fisher Holmes, and other high coloured flowers, which are always well shown by the Yorkshire firm. The other prizes of these principal classes were carried off by the East Anglian growers, in whose stands some fine flowers were shown. Mr. B. R. Cant had in his stand, beside some excellent H.P.'s, some remarkably fine Teas, amongst which were a grand bloom of The Bride, which obtained the N.R.S. silver medal for the best Tea among the nurserymen's class; in fact, the success of this part of England, and the discomfiture of the southern and western growers, which was foreshadowed at the Tea and Noisette exhibition at the Drill Hall, were complete. It was somewhat remarkable that in a season of such brilliant sunshine the dark coloured hybrids should so many of them have been shown in such fine form. My friend, Mr. Biron, and myself have both encouraged Mr. Mount of Canterbury in his ambitious projects of Rose growing, and I think it is somewhat remarkable that in so forward a season as the present, and from so early a locality as Canterbury, he should have captured so many prizes, and even in some instances have beaten such giants as the Cants of Colchester. Some of these days, when he wins the trophy to which he aspires, he must take out a coat of arms with two parsons as the supporters, and an anvil and hammer for his crest; the motto must be left for the present.

Those who recollect the long line of boxes of Teas and Noisettes which overflowed in all directions in 1892 will be ready to confess the immense falling off in numbers in the present Exhibition, and the success which at the Drill Hall attended the East Anglian growers foreshadowed a still greater triumph at the metropolitan Show. "We mean," it was said to me some time ago, "to have the Tea Trophy in East Anglia this year," and so it has happened, for it was carried off in triumph by the Rev. A. Foster-Melliar, whose winning stand will not be easily forgotten. The magnificent flower of Madame Cusin, which won the N.R.S.'s medal for the best Tea in the amateur division, was itself worth going a long distance to see, and was unquestionably the finest bloom in that variety ever exhibited. There were other fine flowers in the stand, one of them a grand bloom of Marie Van Houtte was an instance of what can be done with Tea Roses. It was cut on the Monday previous, had been placed in a nearly airtight and perfectly dark cellar for three days not tied up, and for two more in a cellar with a little light and air, and was almost entirely unchanged when brought out on Friday evening; in fact this has been a year in which this variety has been remarkably fine. The same may be said of Ethel Brownlow, whose brilliancy of colour and stoutness of petal has been conspicuous, displaying merits which some of its most ardent admirers never before thought resided in it. A little disappointment has been felt with regard to Ernest Metz, and this was a scason above all others which was supposed to be favourable to it, and yet there were only two stands of it exhibited, coming from the two Cants of Colchester. I think this of it exhibited, coming from the two Cants of Colchester. seals its doom as to its being offered in a separate class, which has now been tried three seasons and with the same indifferent results. One flower which has sometimes been disparagingly spoken of, but which I have always looked upon with favour, Madame Hoste, has come quite to the front, the box shown by Mr. B. R. Cant being all that could be desired. Alas! the "fortifications of Beaulieu" and the "Paradise of Teas" added nothing to their fame. I was sure the former in such a season would be stormed by enemies that it would be impossible to resist, and that thrips and red spider would make many a breach in the ramparts; but why the latter should have so utterly collapsed I cannot quite understand.

As was anticipated, the season militated strongly against that which has of late years formed so attractive a portion of the Exhibitionnamely, the garden Roses. Hardly one of the single species was in evidence, and it was only through breaking the rules laid down by the N.R.S., introducing Teas and even hybrids, that the stands could be filled. It was, of course, a disappointment, especially to those who, like Lord Penzance, have encouraged progress in this direction, but it was one of those things for which the season had prepared us. By next year Messrs. Keynes, Williams & Co. will have distributed many of Lord Penzance's seedlings, and we may expect a keener competition. New Roses were scarce. Of those of the last two years the only one that has obtained any position is Gustave Piganeau; it is a Paul Neyron style of flower the colour spinson and at present it seems to be much in favour flower, the colour crimson, and at present it seems to be much in favour. It is not in its style one that commends itself much to me, but I think

that it is somewhat early to complain of its growth. It may be as some say of poor habit, but like most new Roses that are likely to be popular, it has been so hard worked that every bit of constitution must have been taken out of it. Another French Rose of a very different character, Gustave Regis, is likely to be a favourite for buttonhole purposes. It appears to be a Hybrid Tea, has a long pointed bud, bright yellow in colour, but with very few petals, so that really it might almost when expanded be considered a single Rose. It is, however, among our home growers that we must apparently now look for sterling novelties, and especially to the Newtownards firm, Alexander Dickson & Sons. exhibited three seedlings, and to two of them was the gold medal of the N.R.S. awarded, an honour which no firm has ever obtained before. One of these, Mrs. Sharman Crawford, is a beautiful bright pink Rose, of fine form and build, reminding one a little of Mrs. John Laing, but quite distinct from that flower, but appears also to have a vigorous constitution. The other was a large full white Rose, suggesting Lady Mary Fitzwilliam. There is an immense quantity of stuff in it, and if it opens well will be a valuable addition to our white Roses. Another gold medal of the N.R.S. was awarded to Mr. Turner's new climbing Japanese Rose, Crimson Rambler. It had already obtained a similar honour at Paris, and has been seen so well and so often that there is very little doubt that everyone who possesses a garden will be anxious to obtain it, and by thus giving the N.R.S.'s highest award to a purely garden Rose the Society has shown its sympathy with the current taste, and that it is by no means bound to bestow all its favours on the exhibition varieties.

Such, then, is a rapid view of some of the more salient points of the show, which, although disappointing in many respects, was the means of bringing together a considerable number of fine blooms, showing that even the most adverse seasons cannot utterly quench the ardour of the rosarians .- D., Deal.

BACTERIAL DISEASE IN TOMATOES.

APPARENTLY Mr. Iggulden (page 79) thinks me inconsistent in my remarks on the use of animal manure for Tomatoes, but if he will turn again to my note on page 49 he will fail to find that I said its use had been followed by the best results. Had I found it so it would indeed be strange for me to advocate the use of chemical manures in preference to animal.

If I could bring myself to believe that the absence of bacterial disease is attributable to the use of animal manure it would rise greatly in my favour. But having lost one or more plants in each of four houses, some fed with animal others with chemical manures, it is very apparent that the absence or otherwise of the disease is not due to the manure used. My principal objection to animal manure is that it renders the plants more liable to the attacks of cladosporium and allied fungoid diseases, especially in badly ventilated houses, as some of mine are.-C. Lock, Bristol.

As Mr. W. Iggulden expresses his intention of convincing others that I have mistaken "effect for cause," when he has "thoroughly convinced" himself, perhaps he will, in the meantime, send a specimen of the disease in Cucumbers which he considers to be identical with that in Tomatoes submitted by Mr. Lock to the Editor, so that I may have an opportunity of satisfying myself of their being synonymous or otherwise. This is imperative prior to a display of "cross swords" for the understanding of what it is all about. Mr. Iggulden, however, indulges in philippic in his preliminary canter, which is not calculated to impress an opponent favourably, and seeking to discredit a prospective antagonist is not usually a proof of prowess. Something more than "appearance" will, of course, be expected from Mr. Iggulden, for unless he gives evidence of his acquaintance with and knowledge of bacterial diseases I must decline to step into the arena for the special delectation of preconceptionists. But I am quite ready to enter the lists with him or anyone undertaking to prove that Mr. Lock's specimen of Tomatoes were not attacked by and destroyed through bacteria. Of these I have representations as shown by the microscope, which exhibit

things as they are, and it is safer to be guided by facts than to strive to erect castles on "appearance."

This shall be the test. Mr. Iggulden to send to me (through the Editor) specimens of Cucumbers, Melons, or Vegetable Marrows collapsing from the disease of which he is "far from being a stranger," and I will subject them to microscopical examination and submit the results, both of Mr. Lock's Tomatoes and Mr. Iggulden's Cucumbers, to the readers of the *Journal of Horticulture*. This will give Mr. Iggulden a chance to display his abilities as a scientist, for in these days something more is expected than mere guesses at diseases and empirical cures .- G. ABBEY.

NOTES IN SEASON.

ANOMATHECA CRUENTA.

This charming Cape bulbous plant is exceedingly useful for flowering at the present time. It is of comparatively easy cultivation, requiring similar treatment to the Ixias, to which it is closely allied. The plants are of a very dwarf nature, attaining only from 6 to 12 inches in height. The flowers, which are produced in great profusion, are of a bright scarlet colour blotched with crimson, and are produced continuously over a lengthened period, thereby making them indispensable plants where a display of flowers has to be kept up.

main flower stem is furnished with numerous flowering branchlets, and is terminated with a spike of from nine to eleven blooms.

The plants must not be allowed to suffer through lack of moisture at the roots. After the flowering season is over, and when the foliage commences turning yellow, the supply of water may be gradually curtailed, but it should never be entirely withheld. The bulbs ought to be shaken out and reported about the third week in February, placing from nine to eleven bulbs in a 6-inch pot. Good fibry loam and leaf soil, with a little sharp sand will form a suitable compost for them.

GLOBE AMARANTH.

Gomphrena globosa or the Globe Amaranth is a most beautiful annual flower, and is exceedingly useful for the summer decoration of the greenhouse and conservatory. It is of a neat and erect branching habit, attaining a height of from $1\frac{1}{2}$ to 2 feet, each shoot being terminated with a compact round head of rich purple flowers. Seeds should be sown in March or April in well-drained pans filled with sandy soil, and placed in gentle heat. When the seedlings appear assign them a light position, and immediately the plants are large enough to handle place them singly in small 60-sized pots. Keep the plants well down in the pots, so that the cotyledon or seed leaves rest on the soil. They should then be grown in a temperature of from 60° by night and 70° by day, with a rise of from 5° to 10° by sun heat.

For ordinary decorative purposes 7-inch or 8-inch pots will be sufficiently large provided liquid farmyard manure or one of the numerous chemical mixtures be applied two or three times a week after the pots are well filled with roots. After the flower heads are fully developed the plants may be removed to the greenhouse or conservatory, where they will keep up a display of flower for a very considerable length of time. Like the old Everlasting Flower, Helichrysum bracteatum, the blooms require cutting just before they are fully expanded, as they then last much longer in perfection.—GEO. PARRANT.

ROYAL HORTICULTURAL SOCIETY.

JULY 25TH.

SCIENTIFIC COMMITTEE.—Present: Dr. H. Müller (in the chair); Dr. Russell, Dr. Scott, Rev. W. Wilks, Dr. Bonavia, Rev. G. Henslow (Hon. Sec.), and Mr. W. Sykes (visitor).

Dianthus, sp., &c. — Dr. Müller showed a speeimen of a Pink from Val d'Annivieres, in the Rhone Valley. It was referred to Mr. F. N. Williams for identification, and proved to be Dianthus prolifer, L. He also exhibited an "Etelweiss," from Mount Cook, New Zealand. Though the inflorescence bore much resemblance to the European form, the foliage was quite distinct, the leaves being obovate, and one-quarter of an inch in length. It was referred to Kew for identification. He also exhibited a Peach, apparently attacked by fungi. It was also referred to Kew for investigation.

Fir-leaved Clover.—Dr. Bonavia showed a specimen of this tolerably

well-known form from garden culture.

Preserving Fresh Ripe Fruit.—Mr. W. Sykes of Woodleigh, East Dulwich, described some methods for preserving fruit in tins and otherwise, the air being exhausted from the tins. The following is the description of Tomatoes:—"The fruit was quite ripe and perfect; after seven days they had not altered, and kept two or three days after being exposed to the atmosphere. After fourteen days the fruit showed signs 'sweating.' They kept the same time exposed and ate all right. After twenty-one days there was considerable sweating, after thirty days more so, after thirty-seven days, still more, the juice draining out badly. The fruit throughout never lost its bright brilliant colour. discussion arose as to the advisability of adopting the plan of exhausting the tins of air. Both Dr. Müller and Dr. Russell were of the opinion that this method was unadvisable, inasmuch as the vacuum can never be perfect, and it tended to expand the cells, and so by rupturing the tissues, "sweating" would increase. Another method described was to bury the fruit like Potatoes or Mangold:—"Apples buried straight from the trees in heaps like Potatoes, surrounded by straw and covered with earth a few inches thick, keep well into the following year. Nonpareil, a very astringent, bright coloured and bad keeper, loses neither colour nor flavour after being buried. Similarly Peas in jars covered over with a bladder and buried, were quite 'fresh' at Christmas. In these and similar cases it appears to be the carbonic acid evolved by respiration of the fruit which acts as a preservative by driving away the air from the

the fruit which acts as a preservative by driving away the air from the enclosed space. This tends to destroy, or at least hinder, the fermentive or putrefactive action of bacteria. Mr. Sykes hopes to communicate further results from experiments with this year's fruit.

*Pelargonium ignescens, \$\beta\$ sterile.—Mr. Henslow exhibited a specimen of this plant found in a cottage garden at Zeals, Devon. On referring to Sweet's "Geraniacea," it appears to have been raised from the seed of P. fulgidum by Sir R. C. Hoare. Another seedling of the same species was P. scintillans. Though called "hybrids" the parentage is unknown. The word "sterile" refers to the anthers being devoid of pollen. P. ignescens (proper), as well as the above, are all figured by Sweet, op. cit., viz., P. ignescens, vol. i., No. 2; P. ign. \$\beta\$ sterile, i., 55; P. scint., i., 28; and P. fulgidum, i., 69. The date given is 1821.

"Shaky" Ash wood.—Messrs. Holland & Holland of Oxford Street forwarded a remarkable specimen of the peculiarity known as "shaky timber" among carpenters. On splitting the wood a central portion

timber" among carpenters. On splitting the wood a central portion separates from the surrounding layers. It is probably due to some seasonal influence when the cambium formed an imperfect and easily separable layer.

EVENTS OF THE WEEK.—The ensuing week will be rather a busy one amongst horticulturists. To-morrow (Friday) there will be a sale of Orchids and animals at Messrs. Protheroe and Morris' Auction Rooms in Cheapside, E.C. On Saturday Shows will be held at Croydon and Southampton, the latter continuing on Monday, August 7th. The Exhibition of the Beddington and Wallington Horticultural Society will also be held on the 7th inst. As announced in another paragraph the Committees of the Royal Horticultural Society will meet at the Drill Hall, James Street, S.W., on Tuesday, August 8th. On the 9th and 10th inst. a special Show of flowering and foliage plants will be held at the Gardening and Forestry Exhibition, Earl's Court, a class being also provided for six dishes of hardy fruit.

- THE WEATHER IN LONDON. The past week has been characterised by changeable weather in the metropolis. Sunday was showery, rain falling heavily at intervals. Similar weather prevailed on Monday. Tuesday was fine and warmer, but much rain fell during the night. Wednesday opened bright, and at the time of going to press it is fine.
- ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Royal Horticultural Society will be held on Tuesday, Aug. 8th, in the Drill Hall, Westminster. Mr. J. J. Baker, F.R.S., of the Roya! Herbarium, Kew, has promised to deliver a lecture on "Cannas" at 3 o'clock, and the Council will feel obliged to exhibitors who will make a special feature of these plants on that day. There will not be another meeting in the Drill Hall until September 12th owing to the four-days show in the Agricultural Hall, Islington, from August 29th to September 1st.
- —— DEATH OF MR. W. THOMSON, JUN.—With great regret we record the death of Mr. William Thomson, son of Mr. W. Thomson of Clovenfords, which took place on July 30th, from pleurisy. Mr. Thomson was in his forty-fourth year, and his untimely decease will be regretted by numerous Scotch and English horticulturists.
- NATIONAL AMATEUR GARDENERS' ASSOCIATION. The members of this Association held their monthly meeting at the Memorial Hall, Farringdon Street, E.C., on Tuesday, August 1st, Mr. T. W. Sanders presiding. There was a large attendance, and some excellent exhibits were staged. Silver medals were awarded to Messrs. H. A. Needs, G. Bell, A. G. Rowberry, G. Stevens, and Cook. Mr. J. Bateman of Highgate read an interesting paper on "Roses for Exhibition," dealing with the subject in a practical manner. A vote of thanks to Mr. Bateman for his essay concluded the proceedings.
- —— Shropshire Horticultural Society.—We are requested to correct the statement made on page 75, that the Carnation prizes to be offered at the forthcoming Shrewsbury Show are withdrawn; all classes stand as in the schedule. The special new class is only to provide for a contingency. Should any Carnation collections come, and we hear some will be staged, these prizes will be awarded just as if no special class has been offered.
- A GOOD ACTION.—At the Committee luncheon of the Reigate Show last week a letter was read by Mr. Wells from a gentleman stating the very deplorable condition through ill-health of a local gardener whose name was given, and asking for pecuniary assistance. A list was handed round the table, and some 35s. collected by Mr. Steer. The case seems to be a very distressing one, as the poor man is in consumption, and there is a large family to be maintained.
- Wakefield Paxton Society.—At the usual weekly meeting of the members of the above Society on Saturday, 23rd ult., the subject for discussion was "Carnations and Picotees." A large table was filled with beautiful specimens, some being the old-fashioned varieties and others were examples of the florist flowers. There were also on the table Stephanotis and Allamanda flowers. The discussion was opened by Mr. Maddock of Lofthouse, who is an extensive and successful grower of Carnations and Picotees. Mr. Maddock strongly recommended his friends to grow Carnations and Picotees. He said they were good town flowers, as they will withstand the effects of smoke, and by a little arrangement it was possible to have plants in bloom all the year round.

- THE DUTCH HORTICULTURAL SOCIETY.—We are informed that members of this Society have intimated their intention to visit Messrs. H. Cannell & Sons' establishments on Saturday, the 12th inst., together with a few other friends.
- —— GARDENING APPOINTMENT. Mr. C. Page, for some years gardener to H. P. Leschalles, Esq., Highams, Ascot, has been appointed to succeed Mr. Lee as gardener to J. B. Fortescue, Esq., Boconnoc, Lostwithiel, Cornwall.
- —— BULBS FOR THE ROYAL PARKS.—We understand that Messrs. W. Cutbush & Son, Highgate, have been favoured with an order for bulbs for the Royal Parks, including St. James's, St. Margaret Square, Regent's Park, and Hampton Court Gardens.
- —— GRAPES AT TRENTHAM.—Through a clerical error on the exhibition card the first prize for four bunches of Grapes was credited to Mr. Crawford in our report on page 82 last week. The winner was Mr. J. J. Craven, The Gardens, Allerton Priory, Liverpool.
- WASP NESTS.—Mr. Edward Gristwood, The Gardens, Hearts Hill, Loughton, Essex, informs us that himself and Mr. W. Dickens, of Dibden Hall Gardens, have destroyed sixty-three wasp nests by pouring petroleum into them, applying a light and burning them out.
- —— BORDER MAID VIOLA.—Mr. John Forbes, Hawick, sends us some blooms of a splendid Viola to be named "Border Maid." It is to be a close compact grower and a free flowerer. The blooms are large and beautiful, of a rich orange colour, with a distinct purplish blue margin.
- MUSHROOMS IN THE NORTH. Mushrooms have been very plentiful in Westmoreland, large quantities being sent away for sale to large provincial towns. In the district around Kirkby Lonsdale, says a writer in a local paper, Mushrooms have been selling at $1\frac{1}{2}$ per lb.
- THE PROPOSED FLORAL CONTEST AT CHICAGO.—We understand that in view of the small amount of encouragement received the Chicago Committee has deemed it best to abandon the project of an international contest in the arrangement of flowers at the World's Fair in August.
- EARLY PEARS.—"J. H. W." observes:—"As evincing the extreme earliness of this season we have been obliged to gather the fruit from two trees of Jargonelle Pears on July 27th, which in 1891 were not ready until September 12th. From two horizontal trained trees on a wall with a west aspect we have gathered 1½ cwt. of very fine fruit. All our bush and pyramid Pear trees are loaded with fruit this season. We have given bushels of fruit to the pigs, but still there are bushels too many left."
- ENGLISH HORTICULTURISTS IN AMERICA.—An American exchange to hand says: "Among notable visitors to Boston during the first week in July was Mr. Nicholson, of Kew Gardens, England, on his way to Chicago. He visited, as does everybody nowadays, the Arnold Arboretum, and spent a few hours among the trees and shrubs. Mr. W-Goldring, brother of the Messrs. Goldring, of Albany, N.Y., honoured Buffalo with a very short visit on Saturday, July 1st. Mr. Goldring has just returned from India, where he has been laying out grounds for some of the native princes."
- TRADE IN COVENT GARDEN MARKET.—As a specimen of how the trade in this market has been developed, we understand, says a daily contemporary, that last week one firm alone dealt with 64,734 packages, including—Green Gages, 27,583; Orleans and other Plums, 15,138; Pears, 8,043; Peaches and Apricots, 5,002; Tomatoes, Salads, and Cucumbers, 4,077; Nuts, 2,098; Cherries, Black and Red Currants, Apples and Grapes, 645; Bananas, Melons and Lemons, 995; Potatoes, Peas and Onions, 1,153. Ten years ago it was considered a wonderful business for one single firm to turn over 20,000 packages in a week.
- STUARTIA PENTAGYNA.—One of the most beautiful American shrubs now in flower is Stuartia pentagyna; its large creamy white flowers, 3 or 4 inches across, with scalloped margins resembling those of some Camellias, to which, indeed, the Stuartia is related. Perhaps, says the "Garden and Forest," the slow growth of this plant while it is young has discouraged growers; at all events, it is so rarely found in gardens that it has never received a common English name. When fully established, however, so that its beauties are developed, this Stuartia is one of the most pleasing of all hardy shrubs which flower in summer, and it should be omitted from no carefully selected collection. It appreciates liberal treatment, and when planted in good loam mixed with peat and enriched occasionally with a dressing of old and well-pulverised manure it will always repay such attention.

LADY GARDENERS.—Mr. J. Riddell, The Gardens, Castle Howard, York, writes:—"Among the weekly papers a report has been going the round that Lady Carlisle contemplated the substitution of women gardeners for the staff at present employed in the gardens here. As the Journal of Horticulture quoted the statement (page 76), and having been asked to contradict the report when occasion for doing so occurred, there not being a shadow of truth in it, I hope you will be able to find space for this note in your next issue,"

— THE FESTIVAL OF FLOWERS.—The sixth National Co-operative Festival will be held at the Crystal Palace on Saturday, August 19th. The flower show will probably be as large as ever, notwithstanding the adverse season. The co-partnership exhibition of goods from workshops in which the workers share profits and management will be much extended, as several new and interesting societies will take part. Mr. Wm. Broomhall, General Secretary, 49, Bedford Street, Strand, offers to send information to all interested in the co-operative movement.

—— STAPELIAS.—The collection of Stapelias formed by the late Mr. Thomas Westcombe of Worcester has recently been presented to Kew by his sister, Miss Westcombe, along with numerous notes, descriptions, and a collection of beautifully executed coloured drawings, prepared by Miss Westcombe from the plants (of Stapelia and allied genera) flowered by her brother. Stapelias, remarks the "Kew Bulletin," are exceedingly difficult plants to cultivate, and many of the species can only be kept through an English winter with the utmost care and attention. Mr. Westcombe's success as a cultivator of these plants was quite exceptional. Since his death some of the plants have somewhat suffered, but most of them will probably recover in their new quarters at Kew.

— A FINE CARNATION.—Mr. Bernard Cowan, The Lodge, Harton Cemetery, South Shields, sends us a photograph of a plant of Carnation Souvenir de la Malmaison that bore 105 blooms, open and unopened. The plant was in a 10-inch pot, and has been grown by Mr. Alex. Turvis, South View, South Shields, who is an amateur grower, and is Chairman of the General Purposes Committee of the South Shields and Northern Counties Chrysanthemum Society. Mr. Turvis takes an active interest in the Exhibition, and his well-known popularity is of considerable advantage to the Society. He is also a grower of Roses and Chrysanthemums, and when his commercial transactions are over the rest of the evening is spent attending to the cares and wants of his favourite flowers.

— KINGSTON GARDENERS' ASSOCIATION. — At the monthly meeting of this Society, held on the 25th ult., a short but very useful paper on "The Gloxinia" was read by Mr. Hawkes of Lismaine Gardens. During the discussion which followed questions were asked as to the insect termed the creeping or jumping thrips, which proved to be so difficult to deal with, so fond of the Gloxinia, and was impervious to fumigation. From Messrs. Sutton & Sons came a collection of cut flowers of their beautiful strain, and Mr. Peed, a local gardener, also brought some brilliant flowers of the same strain. Mr. Hawkes showed some very fine Cockscombs, and Mr. T. Cushon exhibited a good Melon Imperial Green-Flesh, grown in a frame without bottom heat after Potatoes had been taken out. Mr. A. Dean will give an address on "Hardy Border Flowers" to the members at the meeting on August 29th.

- FLORA OF MOUNT KINI BALU. - The collection of dried plants from the above locality in N.E. Borneo, referred to in the "Kew Bulletin," 1892, p. 249, has been worked out by Dr. O. Stapf, the Assistant for India at the Herbarium, who read a paper on the subject before the Linnean Society on the 15th June last, which will probably appear in one of the Society's publications. In addition to the plants collected by the Drs. Haviland, Dr. Stapf has also taken up a small collection from the same mountain, made by Sir Hugh Low some forty years ago, together with a few plants collected more recently by Mr. F. W. Burbidge. Altogether they number about 400 species, 320 of which are phanerogams. There are two new genera and upwards of 150 new species, for the greater part shrubs. Melastomaceæ and Rubiaceæ largely predominate in the lower elevations, and the last family is somewhat numerously associated with increasing numbers of Ericaceæ, Vacciniaceæ, Orchids, and Ferns at higher levels. Noteworthy among the novelties are eleven very distinct new species of the Ericaceous genus Diplycosia, and two new species of the Australian Irideous genus Patersonia. Many other new facts have been brought to light by the combined collections, and Dr. Stapf's paper promises to be of more than ordinar interest.—("Kew Bulletin.")

— A NOVEL CONTEST.—In connection with the Show of the Beddington, Carshalton, and Wallington Horticultural Society, to be held in Carshalton Park on the August Bank Holiday, a class instituted by Mr. A. H. Smee is creating a good deal of interest. It is thus set forth—"For the best dinner to be produced at a cost not exceeding 2s. The dinner must consist of meat and at least two distinct kinds of vegetables, and be sufficient for a man, his wife, and three children. The value of each article must be clearly stated. First prize, £2; second do., £1 10s.; third do., £1; fourth do., 10s." We are informed there are thirty entries. Also in connection with the same Show a conference on gardening is announced under the presidency of E. J. Halsey, Esq., Chairman of the Surrey County Council. Superior and inferior garden produce will be exhibited, and a short address thereon given by Mr. J. Wright for the instruction of amateurs, cottagers, and allotment holders.

— DWARF CONVOLVULUSES. — Amongst the numerous hardy annuals which were recently blooming so profusely in the seed grounds of Messrs. Sutton & Sons, Reading, were three forms of dwarf Convolvuluses, which were so wonderfully true to character that 10,000 flowers seemed to be exactly alike. It was quite remarkable to find how well these annuals were doing in the drought, and still more how effective and lovely in their respective masses they were. Very charming indeed is subcæruleus, the flowers of a pleasing sky blue colour. This is at once a novelty and a beauty. Quite different because so dark is Crimson Violet, the flowers of a heavy but rich hue, as its name implies; and most effective is the brilliant Dark Blue. To these may be added the White, but the others are delightful.—D.

- AUTUMN-SOWN ONIONS.—This is a good time to make a sowing of Onions for producing bulbs next May and two following months to succeed those raised from seed sown during last spring. If the ground is in fairly good condition as regards fertility it need only be dug, trodden, surface-dressed with soot, and raked level; then draw drills from 12 to 15 inches asunder and about 1 inch deep, running north and south, for the reception of the seed. Early White Naples and White Elephant are good varieties to sow for standing the winter. Sow the seed sufficiently thick, the drills to admit of some of the young plants being drawn for salading, where used for that purpose, and to make good any blanks that might occur in the ranks through any cause during the next five or six months. Close the soil over the seed in the drills with the feet, tread, and afterwards rake level in the same direction as the drills. Transplantings can be made from the thinnings in the spring if it should be deemed necessary to extend the crop, allowing a space of from 6 to 12 inches between the plants in the rows, the ground being prepared in the manner advised for seed .-H. W. WARD.

- THE WEST AFRICAN PALM OIL TRADE.-In his report to the Colonial Office on the botany of Sierra Leone, Mr. Scott Elliot says that the export of Palm oil and kernels forms by far the largest part of the West African export trade. In 1890 the value of the Palm oil exported from Sierra Leone was £13,599 and of the Palm kernels £107,827. The tree is more abundant further down the West African coast, and appears to prefer alluvial, often marshy, ground near the sea. It particularly seems to thrive on the rich soil of the Mangrove accumulations. There are large numbers of Palm trees in the Mahela district, where a factory once existed, and there are also a considerable number up the Scarcies River and in the lower part of the Limba district. It grows also on low sandstone or gneissose hills, but probably does not produce so much in such places as on the low-lying, rich alluvials. The Palm is propagated from the offshoots that appear at its base, and these are said to begin in the second or fifth year, and are in full bearing about the tenth to fifteenth year. They continue producing for sixty years. A single tree yields from 1 to 3 gallons of Palm oil, or, according to Semler, 16 litres annually, and this amount of oil will give from onesixth to half a hundredweight of kernels. This would be a profit of from 2s. to 6s. a tree per annum, as about 300 gallons of Palm oil give a ton of oil and about $2\frac{1}{2}$ tons of kernels. Hence plantations of these trees should be profitable in time. It is, however, exceedingly difficult to get any trustworthy information, and the above, Mr. Elliot says, must be regarded as very approximate. The Palms require no care, and are not, apparently, attacked by any injurious insects. The preparation is of a very rough and makeshift character; the fruits are thrown into a tank and left till decomposition begins. They are then boiled and afterwards pounded in a mortar. Probably 25 per cent. of the oil is lost in preparation.

— HIPPEASTRUM PROCERUM. — This is the blue Amaryllis of horticulturists, and the Amaryllis Rayneri of "Botanical Magazine," t. 5883. It was introduced by M. Binot from South Brazil about 1863, says the "Kew Bulletin," but it has remained rare in cultivation, probably on account of the difficulty experienced in getting it to flower. Two plants of it have been flowering in the Succulent house (No. 5) at Kew. The species is quite distinct from the rest of the genus, the bulb having a neck 18 inches long and distichous falcate ensiform leaves, firm in texture, with a white cartilaginous edge. The flowers are borne in an umbel, and they are as large as the Belladonna Lily. The colour is bluish-lilac with numerous spots of a darker shade of purple.

— WIDCOMBE HORTICULTURAL CLUB.—Some members of this Society had, on July 24th, the privilege of seeing the Begonias grown by the Rector of Newton St. Loe. The visit came as a surprise, for it was not included in the printed programme of the Club's proceedings, but was arranged at the invitation of the Rev. E. Lascelles by the energetic Hon. Secretary of the Club, who is always seeking opportunities of increasing its usefulness and of affording instruction and enjoyment to the members, about forty of whom with a few friends left Widcombe shortly after six o'clock in three well-horsed conveyances for Newton. Mr. Lascelles cordially welcomed the party, and after showing the visitors all over his beautiful garden, promised to give the members a lecture upon his favourite flower—the Begonia.

— Hanbury Medallion.—According to the July number of the "Kew Bulletin," the museum of the Royal Gardens has lately become possessed of a medallion portrait of the late Daniel Hanbury, F.R.S., F.L.S. This medallion is the original model in plaster by the late Thomas Woolner, R.A., and was copied in marble for Mr. Thomas Hanbury, F.L.S. It is a faithful likeness of the great pharmacologist. The ornamentation on the flat surface surrounding the portrait represents the plants to which Daniel Hanbury gave special attention—namely, Liquidambar orientale, Mill, which he proved in 1857 to be the source of Liquid Storax, and Ipomæa simulans, a species of his own, and described by him in a paper read before the Linnean Society in 1869 as the source of Tampico Jalap. Kew is indebted to Mrs. Woolner for the gift of this medallion, which finds a fitting bome in a museum greatly enriched by numerous contributions of vegetable drugs made by Hanbury himself during his lifetime.

- FRUIT CULTURE IN RUSSIA .- We are informed that "The Russian Society of Fruit Culture is, with the sanction of the Czar. organising an international Exhibition to be held at St. Petersburg in the autumn of 1894, with the object of showing the present condition in Russia of the cultivation of fruit, medicinal plants and vegetables, and of the manufacture of their products." It is also stated that "A congress of pomologists will be convened simultaneously with the Exhibition, and all persons interested in the progress of horticulture and pomology, both in Russia and other countries, are invited to take part in the Exhibition, which will comprise the following sections: Fresh fruit, fresh vegetables; dried fruit and vegetables, preserved or treated by other processes; wine, cider, perry, and other fruit beverages; Hops and medical herbs, seeds, fruit trees and bushes, horticultural implements and appliances and technicality of production, together with literary, scientific, and educational accessories, collections and plans." It is expected that further details will be forthcoming in due course.

- ORIGIN OF THE PEACH.—Nothing is now more universally accepted than the fact that the Peach is an improved variety of the Almond. The Almond has a thin shell around the stone, which splits open and exposes the stone when mature. This outer skin has simply become fleshy in the Peach, so that is all that gives it its specific character. It seems now clear from investigation in the history of ancient Babylon that in their gardens, now nearly 4000 years ago, the Peach was cultivated then as it is now. It must have been many years before this that the Peach was improved from the Almond, and this fact goes to show the great antiquity of the fruit. Possibly gardening in some respects, at least so far as it relates to many of our cultivated fruits, was as far advanced six, or perhaps eight or 10,000 years back as it is to-day. Phoenec ans, many thousands of years ago, as is proved by the records, had in their gardens Almonds, Apricots, Bananas, Citrons, Figs, Grapes, Olives, Peaches, Pomegranates, and even Sugar-cane was in extensive cultivation. Certainly this shows how very far advanced these nations were in garden culture these many years ago.—("Meehans' Monthly.")

—— PLATYCODONS.—Not very appreciable, if indeed is there any distinction, between the Platycodons and Campanula grandiflors and its varieties. Possibly the distinction is found only in name, and if there be none, then the diverse appellations are misleading. At Messrs. Barr and Son's Long Ditton Nursery, various Platycodons are in abundant bloom, and at this season most deservedly rank amongst the best of hardy garden flowers. The growth is in most cases about 2 feet in height, the stems producing numerous side flowers on long stems, which are admirable for cutting. Grandiflora, single blue, and plenum, double and darker; album and striatum, also Mariesi, are capital varieties.—A. D.

- EARLY APPLES.-I specially noted the best six varieties in the respective dessert and kitchen sections of Messrs. G. Bunyard & Co.'s very fine collection shown at the Drill Hall on the 25th ult. The Apples for the time of year were wonderfully fine, and all from the open air. Mr. Woodward of Barham Court, however, tells me that Apples are swelling wonderfully fast since the rains, and that there should be some grand fruit at the Agricultural Hall Show. I found of dessert varieties Gladstone, Red Juneating, Red Astrachan, Beauty of Bath, Lady Sudeley, and Red Quarrenden to be the best, ripening in about the order placed, whilst of kitchen sorts Lord Grosvenor, Lord Suffield, Grenadier, Stirling Castle, Peter the Great, and Potts' Seedling were the best. I have seen elsewhere Warner's King and Emperor Alexander very fine too. On the whole, we shall probably find it needful to have many of our finest Apples gathered fully a month earlier than usual, or they may fall from the trees. The netting of the finest samples will become imperative in many cases.—A. D.

- DEATH OF A LADY BOTANIST.—The death is announced, on Thursday last, of Miss Anne Pratt, who was born at Strood, near Rochester, in 1806. This distinguished botanist published her first book when just twenty years of age, entitled "Flowers and Their Associations," a work characterised by elegance of thought and refinement of diction, qualities that marked all her numerous subsequent writings. A devoted student of nature, accurate and painstaking in all her researches, she was also gifted as an artist. She made exquisite sketches of plants to illustrate her subjects. She was the author of "Pratt's Catechism of Botany," "The Field, the Garden, and the Woodland," "Wild Flowers," "The Dawnings of Genius," "Poisonous Plants," "Common Things of the Seashore," and other works. Heropus magnum was "Flowering Plants and Ferns of Great Britain," which was illustrated with coloured block-printed plates, and forms anexhaustive history of all British species, which ever since its appearand has taken rank with standard botanical works. The copyright expiring in 1879, it was bought by the publishers, Frederick Warne and Co., the senior partner of that firm having from the first entertained a great partiality for the work, and in 1880, at the age of seventy-three, the author, with her characteristic vivacity, revised it, and the work was reproduced in a cheaper form. Miss Pratt married in 1867 Mr. John Pearless, of East Grinetead, who survives her.

- HISTORY OF WHINHAM'S INDUSTRY GOOSEBERRY. - The originator of the Gooseberry, which has now become an almost universal favourite with the market gardening fraternity, was, says the "Newcastle Chronicle," Mr. Robert Whinham of Morpeth, himself a market gardener. Whinham was born early in this century, and up to within a few years of his death, which occurred in 1858, he occupied as tenant the Allery Banks Gardens, belonging to the Earl of Carlisle, at Morpeth. There it was that he first began cultivating and propagating the Gooseberry. All the time the labour and the thought he expended in perfecting his venture profited him but little in the shape of pecuniary reward. He died a poor man. His grave in Morpeth churchyard is practically unknown, and no memorial of him exists other than which he established himself by giving his own name to the fruit he originated. Attracted as we always have keen by fruit culture, it was not without feelings of interest that we paid a visit the other day to the very garden which witnessed the early struggles of Robert Whinham. Situated on the rising ground to the south-east of Morpeth, and in close proximity to the railway, we found the scene of his labours. The summer evening was closing in as, escorted by Mr. George W. Purdy, the present tenant, we wandered through the garden, which is almost entirely given over to the cultivation of Gooseberries, the whole area being sheltered and protected by old Apple trees. Mr. Purdy's father immediately succeeded the Whinham family in the tenancy, and when he took over the garden he found there bushes of the identical berry which must have been some of the very first cultivated by Whinham. These bushes had then reached maturity, and some of

them yet remain in very vigorous growth. One of these, which cannot possibly be less than forty-seven years old, has cropped heavily ever since 1856. Last year it yielded three and a half stones of berries; this year it was still more heavily laden, the estimated weight of the crop being four stones.

CAMPANULA GRANDIFLORA MARIESI.

At the meeting of the Royal Horticultural Society on July 25th Messrs. G. Paul & Son, the Old Nurseries, Cheshunt, staged a plant of Campanula grandiflora Mariesi, and for which the Floral Committee

John Bennet Lawes, LL.D., F.R.S., and Dr. John Henry Gilbert, F.R.S., in commemoration of the fifty years agricultural, chemical, and botanical investigations which those gentlemen have jointly carried out on the Rothamsted estate, and which have become famous throughout the world. The proceedings on Saturday were the result of a movement initiated by the Prince of Wales, who called a meeting at the rooms of the Royal Agricultural Society on March 1st last, when His Royal Highness gave the following brief outline of the work of Sir John Lawes and Dr. Gilbert:—

and Dr. Gilbert:—

"All those who are interested in the progress of agricultural knowledge, and especially in the application of chemistry to the cultivation
of crops and the feeding of stock, must be aware of the extreme importance of the valuable series of experiments so long carried on at

FIG. 16.—CAMPANULA GRANDIFLORA MARIESI.

awarded a first-class certificate. The plant, also known as Platycodon grandiflorum Mariesi, is not a new one, inasmuch as it was introduced upwards of a decade ago. It is nevertheless worthy of more extensive culture, and should be given a place in every garden.

As shown in the illustration (fig. 16), the plant is dwarf in habit, being not more than 6 inches in height. The flowers are large and broad, measuring 3 inches or more in diameter, and of a brilliant purplish blue colour with darker veins. It is a charming plant, and deserves a better fate than it hitherto has had.

THE ROTHAMSTED JUBILEE.

An event, which was described as "unique in the history of scientific collaboration, as well as in the history of scientific research," was celebrated in the Hertfordshire village of Harpenden on Saturday, when a huge granite memorial was dedicated and presentations made to Sir

Rothamsted by Sir John Bennet Lawes. These experiments were commenced in the year 1843, so that the current year will witness the conclusion of no less than half a century's investigations, which have been conducted during the lifetime of their founder. During the whole of this period, moreover, Dr. Gilbert has been associated with Sir John Lawes in the work of experimental research. The Rothamsted experiments have from the commencement been entirely disconnected with any external organisation, and have been maintained at the sole cost of Sir John Lawes. For the continuance of the investigations after his death, Sir John has recently made the munificent endowment of £100,000, besides the famous laboratory and certain areas of land, and has nominated some of the most distinguished scientists of the day to administer the trust. In view of all these facts, and the great national importance of the Rothamsted experiments, it is only fitting that some public recognition should be made of the invaluable services rendered to agriculture by Sir John Lawes and his distinguished colleague, Dr. Gilbert.

As the result of the meeting an Executive Committee was formed,

consisting of the Duke of Westminster, K.G., President of the Royal Agricultural Society of England, Chairman; the Earl of Clarendon, Lord Lieutenant of Herts; Viscount Emlyn, Chairman of the Chemical and Woburn Committees of the Royal Agricultural Society; Lord Kelvin, P.R.S.; Sir John Lubbock, M.P., F.R.S., Trustee of the Lawes Agricultural Trust; Dr. H. E. Armstrong, F.R.S., President of the Chemical Society; Professor Charles Stewart, President of the Linnean Society; Sir John Evans, F.R.S., Treasurer of the Royal Society, Honorary Treasurer; and Mr. Ernest Clarke Secretary of the Royal Agricultural Treasurer; and Mr. Ernest Clarke, Secretary of the Royal Agricultural Society, Honorary Secretary. Subscriptions were invited with the result that a sufficient sum was obtained to erect a granite memorial weighing over 8 tons immediately opposite the laboratory (which was built by public subscription and presented to Sir John Lawes in 1854), and which stands out boldly in view from all points of Harpenden Common; to have a three-quarter length portrait of Sir John Lawes painted by Herkomer; and to purchase a massive silver salver to present to Dr. Gilbert. The mcmorial is a massive boulder of granite placed end-ways on another square block. On the side facing the common is this inscription:— "To commemorate the completion of fifty years of continuous experiments in agriculture conducted at Rothamsted by Sir John Bennet Lawes and John Henry Gilbert, A.D. MDCCCXCIII." But besides these presentations, and also addresses from the subscribers, various learned and agricultural societies, both at home and abroad, took the opportunity of presenting other addresses, so that the proceedings of Saturday were international in their character.

There was a large and distinguished company present. Mr. Herbert Gardner, M.P., President of the Board of Agriculture, presided. On his right were Sir John Lawes and Dr. Gilbert, and on his left the Duke of Westminster and the Duke of Devonshire. Among the others present, in addition to the members of the Executive Committee whose names are given above, were Earl Cathcart, Lord Amherst of Hackney, Viscount Grimston, the Hon. A. Holland-Hibbert, M. Johanet and M. Aubin (representing the Société des Agriculteurs de France), Sir J. D. Hooker, Sir Owen Roberts, Professor Michael Foster, Professor F. O. Bower, Professor Kinch, Sir Jacob Wilson, General Cohnsae, Mr. W. Carruthers, Dr. Fream, Professor Sheldon, Major Craigie, Professor Church, Mr. Henry F. Moore, Mr. Ludwig Mond, Professor W. Odling, Dr. W. J. Russell, Mr. Martin J. Sutton, Mr. Charles Whitehead, Dr. J. A. Voelcker, Mr. A. Warrington, Professor W. A. Tilden, Dr. Bernard Dyer, Mr. W. H. Perkin, Mr. W. Crookes, and Mr. W. H. Parkin, all of whom were subscribers also to the testimonial. Apologies were read for non-attendance from the Prince of Wales, M. E. Tisserand, Councillor of State, Director of Agriculture for France, and many others, as well as a telegram of congratulation from the Association of Experimental Stations in the United States and Canada.

Mr. HERBERT GARDNER, M.P., who was received with cheers, said they had met to honour as far as it was in their power, in the name of agriculture and of the agricultural classes, two distinguished men—Sir John Lawes and Dr. Gilbert (cheers)—who had rendered invaluable services to our great national industry. It was felt that, in addition to mere personal testimony of regard, there should be some outward and endurable memorial of the admiration which the agricultural world felt for the valuable work which had illustrated the lives of those two More durable even than that granite block would be the complete series of records of the work done at Rothamsted which were contained in the large series of works which lay on the table before him (cheers), and he had done something towards making these of more value by obtaining a grant from the Treasury in order to purchase fortyfour complete sets which he had presented, at the expense of the nation, to leading public institutions. (Cheers). During the fifty years the experiments at Rothamsted had been in progress there had been remarkable changes, Wheat having fluctuated no less than 50s. per quarter, having been as high as 74s., and in May last as low as 24s. 8d. He thought the development of the steam ocean traffic had done more to bring down the price of Wheat than either Cobden or Bright, and the present low range he attributed to England having accumulated an unusual surplus just after the Russian famine, and in the diminution which had been going on there might be found some scintilla—slight it might be-of better times. (Cheers.)

The DUKE OF WESTMINSTER, after offering his personal congratulations, read the following addresses from the subscribers:-

"To Sir John Bennet Lawes, D.C.L., LL.D., F.R.S., &c.—On bchalf of the Committee of the Rothamsted Jubilee Fund, and of the numerous subscribers to that Fund in all parts of the world, I offer you the most hearty congratulations on the completion of half a century's uninterrupted investigation of agricultural problems of the highest practical value and interest.

"These investigations, which originated with you, relate not only to the growth of cereal and other crops under the most varying conditions, but also to the economic effect of different foods on the development of the animals of the farm. They have embraced, moreover, most important researches concerning the chemical constituents of soils, the rainfall, drainage waters, and the sources from which plants derive their supply

of nitrogen.

"During the whole of this period of fifty years you have had the zealous co-operation of your lifelong friend Dr. Joseph Henry Gilbert,

you we desire on the present occasion to congratulate.

"For the continuance of the experiments and investigations which have already extended over so long a period, you have munificently provided by the establishment of the Lawes Agricultural Trust, so that

our successors will profit even more, if possible, than we of the present day have done, by your enlightened labours.

"The memorial which is now erected, will, it is hoped, preserve your joint names in honoured remembrance for centuries to come, while the portrait that is presented to you herewith will hand down to future generations the likeness of one of the most disinterested as well as the most scientific of our public benefactors. — ALBERT EDWARD P., July 29th, 1893."

"To Joseph Henry Cithort M. A. D. T.

"To Joseph Henry Gilbert, M.A., Ph.D., LL.D., F.R.S., &c.—In celebrating the jubilee of the Rothamsted agricultural experiments, it is impossible to dissociate your name from that of Sir John Lawes, and on behalf of the subscribers to the Rothamsted Jubilee Fund in all parts of the world, I offer you the most hearty congratulations on the completion of your fifty years of continuous labours in the cause of agricultural science.

"The nature and importance of those labours are so well known that it is needless to dilate upon them; but if the institution of the various investigations and experiments carried out at Rothamsted has been due to Sir John Lawes, their ultimate success has been in a great measure secured by your scientific skill and unremitting industry. Moreover, by your lectures and writings, you have been a leading exponent in this and other countries of the theoretical and practical aspects of the researches that have been undertaken at Rothamsted.

"A collaboration such as yours with Sir John Lawes, already extending over a period of upwards of fifty years, is unexampled in the annals of science. I venture to hope for an extended prolongation of these joint labours, and trust that the names of Lawes and Gilbert, which for so many years have been almost inseparable, may survive in happy conjunction for centuries to come.—Albert Edward P., July 29th,

M. JOHANET then read an address in French from the Société des Agriculteurs de France, and M. AUBIN one from those employed in the laboratory of the same Society.

The DUKE of DEVONSHIRE presented addresses from the 11,000 members of the Royal Agricultural Society of England, and offered to Sir John Lawes and Dr. Gilbert their most hearty and cordial congratulations on the completion of half a century of investigations at Rothamsted, which had been of such paramount importance to the agricultural community, and the continuance of which had been secured to succeeding generations by the generous benefaction of Sir John Lawes. At Rothamsted they saw what experimental work ought to be—work which had had a great effect on all other experimental work in the country. In the name of the Royal Agricultural Society of England he had to offer their most sincere and grateful thanks to Sir John Lawes and Dr. Gilbert for their valuable work, and to express the hope that they might long be spared to continue their labours, as was well described in the charter of the Society, "For the general advancement of agriculture." (Cheers.)

Dr. Michael Foster presented an address from the Royal Society of England; Dr. Armstrong next presented an address from the Chemical Professor Stewart from the Linnean Society; Professor Kinch from the Cirencester College; and Mr. Ernest Clarke (in the absence of M. Tisserand, Director of Agriculture in France), on behalf of the Société Nationale d'Agriculture de France. This address, coming as it does from what is probably the oldest and most unique agricultural Society in the world—a Society in which membership is more prized than in any other—was probably the most gratifying of any presented. It ran as follows:—"Société Nationale d'Agriculture de France. Hôtel de la Société, Rue de Bellechasse, 18, Paris, 19th July, 1893. To Sir John Bennet Lawes, Bart. Sir and dear colleague,—We, the members of the board and officers of this ancient agricultural Society of France, in our name, and in the name of our fellow Associates, have the honour, on this members he day, to tender to your and to your constant and faithful this memorable day, to tender to you and to your constant and faithful companion Dr. Gilbert, the expression of our sincere respect and admiration for your invaluable contributions to agricultural science. By a remarkable concurrence of circumstances we observe that in the year 1856 two of the then most prominent agricultural chemists of Europe were received in our ranks—namely, Dr. Julius Liebig and Sir John Bennet Lawes, thus finding their opportunity to blend their superior knowledge with the science and experience of our own Boussingault, whose methods of investigation bore a striking similarity of genius and a frame of mind akin to theirs. More fortunate than Boussingault, you have enjoyed the rare advantage of conducting with an unequalled vigour and singleness of purpose through a long series of years the toil-some and arduous but glorious pursuits to which you have devoted your life, and of crowning your multifarious researches with results of scientific and practical value, which for ever will engrave your name in the grateful memory of mankind. May you, Sir and dear colleague, with the powerful assistance of your learned friend Dr. Gilbert, continue during many years to come your noble and fruitful existence for tinue during many years to come your noble and fruitful existence for the benefit of your contemporaries and of posterity. With this our heartfelt wish, we have the honour, Sir and dear colleague, to remain your respectful and affectionate admirers, and in special Committee assembled appose duly our signatures:—E. TISSERAND, President; CHATIN, Vice-President; LOUIS PASSY, Secrétaire Perpetuel; HENRY L. DE VILMORIN, Vice-Secrétaire; A. LIEBAULT, Tresorier Perpetuel; J. LAVERRIERE, Librarian. Paris, 19th July, 1893."

SIR JOHN LAWES, who, on rising to reply, was received with hearty cheering, said that it was only a very few months since he and his wife received the congratulations of many friends on having attained fifty years of married life, which was occasionally called a golden wedding.

afternoon he had to return thanks to that distinguished company for congratulating himself and Dr. Gilbert on the work they had carried on together for fifty years. When two persons were joined together in marriage they could not part—they were bound together by a solemn tie. Dr. Gilbert and himself were bound by no ties; but this connection, as he had said, had continued fifty years. What was the cause of that? It was nothing less than that he had an immense love of the work they were engaged in. He had delighted in the work from the very beginning, and had given as much time to it as he could consistent with other duties; but Dr. Gilbert had made it the work of his life. Had it not been for the labours of Dr. Gilbert the affairs of Rothamsted would have been in a different state to that in which they now were. Dr. Gilbert was not only at work when he was at home, but what were called holidays were spent by him in visiting other countries and places, by putting himself in communication with other bodies, so that he might make his own work more valuable to those at home. This year he was going to Chicago to deliver a course of lectures on the work at Rothamsted. Sir John Lawes then cordially thanked those present for the presentations which had been made to him, and hoped that in fifty years' time such a representative assembly as he saw in front of him would meet to do honour to those who came after them. (Cheers.)

Dr. GILBERT, in acknowledging the gifts, referred to the coldness and doubt with which their early experiments were received, especially when they departed from the orthodox lines, and instanced how those who at first opposed them eventually were converted and became their firm advocates and supporters in a work so important to the agricultural interest. He thanked Sir J. Lawes for the very kind way he had referred to their connection, and expressed the hope that it would continue, although in the natural course of things it could not be expected to exist for many more years, but they desired that matters would be left in such a way that their work might still be carried on

by others. (Cheers.)

Votes of thanks to the Executive Committee and to the Minister of Agriculture for presiding brought a memorable function to a pleasant conclusion. Most of the visitors afterwards attended a reception given by Lady Lawes in the picturesque old manor house at Rothamsted.—
("The Times.")

CARNATIONS AT SLOUGH.

Carnation growers, like others interested in horticulture, will have cause for remembering the season of 1893. Good blooms have been as abundant this year as on any other previous occasion, but the period of flowering has been disastrously short. Evidence of this one could not help noting in many ways. Where possible dates of the Carnation shows were altered to meet the requirements of growers, and in such eases flowers of excellent quality were staged. There were, however, exceptions to this rule, and where it was found practically impossible to change the dates of the shows according to the season, the display of bloom was far from being extensive. In a similar manner the Carnations in the garden have been affected, and it is only by the greatest difficulty that it has been possible to retard the blooms. Nurseries as well as private gardens have suffered in this way, and on calling at Mr. C. Turner's Royal Nurseries, Slough, a week or so ago I found most of the blooms practically past their best. I was, however, in time to take a hasty glance at the flowers that were exhibited at Birmingham on Saturday, July 22nd, before the boxes were despatched to the railway station.

For the purpose of keeping the blooms clean, and perhaps retarding them, many plants were in pots in shaded houses. It could be easily seen that the Carnations had been exceedingly fine, and that a large and choice collection is grown at Slough. The best in flower at the time of my visit included some grand varieties. Among the selfs Rose Wynne was specially noticeable. This is a crimson self with a fine broad petal, and the bloom is very large. When shown at the Harl's Court Exhibition last year it attracted attention, and a first-class certificate was awarded for it. King of the Scarlets was also exceedingly good. This is a grand self of good shape and substance, and should be found in every garden. Iver White is one of the best white Carnations in eultivation, being of good habit, early, and very profuse in flowering. Rose Unique, a splendid flower with broad petals, was in good condition, as likewise was Salamander. The latter is an exceedingly fine bloom of a salmon scarlet colour, and has been certificated. Germania, one of the best yellow selfs, was in first-rate condition; and of Rose Celestial, a large rose-coloured self, and an improvement on the well-known Mary Morris, it can only be said that it should be found in every garden. The Governor is a fine white with a blush tint, and Dazzle is a very bright scarlet of a free flowering habit. The latter is strongly recommended for bedding purposes. Ne Plus Ultra, a fine fringed white, was grand, and Duchess of Fife, a soft pink shade, was specially noteworthy. Tree or perpetual flowering Carnations are also extensively and well grown, and the same may be said of seedlings. The latter were past their best, but the huge beds of them left evidence of what a grand display of bloom there had been. The flowers were obviously produced in hundreds on each plant, the latter forming a sturdy tuft of growth.

With regard to the Picotees these, like the other sections, are admirably represented. The plants are vigorous, healthy, and the flowers, what remained of them, were all that could be desired. Duehess of Sutherland is a most distinct and beautiful variety. The flower is large, full, and heavily edged with bright rose. Madeline is an extra

fine variety, with broad pure white petals, edged with bright rose; and in Gazelle we have a medium sized but good shaped flower, with a rich purple edge. Romulus is a grand Picotee, with a buff ground suffused with pink; and Countess of Jersey is a yellow ground variety, edged with bright rose. Annie Douglas is an attractive flower, with a yellow ground and deep pink margin. Victory is a splendid variety, with an orange-coloured ground, flaked and edged with red; and Old Coin is another distinct variety of the same character. Lord Rendlesham, Mrs. Henwood, and Sunset are also good yellow or buff ground varieties, and being good growers will doubtless find their way into most collections if they have not already done so. Carnations are by no means the only plants that are well grown at Slough, but to see them was the purport of my visit, hence, for the present, the reference to them alone,—C.

THE CHRYSANTHEMUM SEASON.

I THINK the coming Chrysanthemum season will be more "peculiar" than either early or late. Some varieties have been much affected by the very hot season. The wood has ripened and plants are showing the crown bud, in some cases three weeks earlier than in other seasons, while in other varieties the weather has not made any appreciable difference. Although it is more than likely that some of the best blooms will be seen towards the end of October, yet many of the varieties usually taken on the "crown buds" will this season have to go to the "terminals," and thus the majority of the flowers will probably develop somewhere about the usual time.—Geo. Woodgate, Warren House Gardens, Kingston Hill.

CHRYSANTHEMUM PROSPECTS.

It is difficult at present to accurately guage the prospects of the season as to its being early or late. My opinion is that it will not be a late one, but rather the opposite amongst the general body of cultivators who cannot be said to have had much experience in the cultivation of Chrysanthemums primarily for cut blooms. My reason for thinking so is this. There is such a tendency nowadays to obtain size in the flowers, and those persons to whom I chiefly allude have learnt that the early formed buds give the largest blooms in one way, and as many of the plants showed "crown" buds during the month of July they were loth to let them pass, and consequently many were "taken," with the result that must inevitably follow, early and coarse flowers.

By following such a method of culture I prognosticate much

By following such a method of culture 1 prognosticate much grumbling from the middle of October about the earliness of certain varieties. When we see such varieties as Mdlle. Lacroix and Peter the Great showing the colour of their florets and developing from "crown" buds in July, what must we expect in October? Such instances as this are but examples of what are to follow. Experienced growers know that buds "taken" in July are entirely useless with but few exceptions, that they fight shy of any that form at that time, preferring to have others which will show themselves about the third week in August, as the result of pinching out the July buds and running on the growth another stage.—E. MOLYNEUX.

THE Chrysanthemums about here are forming their "crown" buds very early—in fact, too early to be of any use for exhibition. Stanstead White, Etoile de Lyon, E. Molyneux, Beauty of Castlewood, Viviand Morel, and Comte de Germiny have all shown the "crown" bud. During the past week buds could plainly be seen on Avalanche, Puritan, W. H. Lincoln, Hamlet, Louis Bæhmer, Mrs. A. Hardy, Gloire de Rocher, and several others. W. H. Lincoln, Madame Lacroix, and Viviand Morel have already thrown three "crown" buds each.

The following varieties of incurves are also showing this morning (July 31st):—Jeanne d'Arc, third bud; Mons. Bahuant, third bud; Madame Pierre Blancard, over 6 fect high; Ami Hoste, G. Doughty, Queen of England, and also on a plant of Miss M. A. Haggas that was pinched back on May 29th. Several others look as though the bud would appear in a few days. With the exception of Mrs. A. Hardy, Beauty of Castlewood, and Louis Bæhmer, none of the buds have been taken. The plants are very strong and healthy, and at present have not received any stimulant with the exception of a little soot water occasionally. Taken all round, I am afraid it will be a difficult matter to time the buds with any certainty, and several gardeners I have spoken to on the subject are of the same opinion. It would be interesting to know how other Chrysanthemums are behaving in different localities.—W. J., Sutton, Surrey.

CANKER IN FRUIT TREES.

In Mr. Abbey's article entitled "Canker in Fruit Trees" occurs the following passage, on page 50:—"There is no question about the Pear trees; they or their fruit arc troubled with the seab fungus, Cladosporium or Fusicladium dendriticum var. pyrinum, which attacks the young wood and produces eankerous sealy condition of the bark, &c."

There is a fungus which attacks the young wood of the Pear tree as

above stated, and also the young wood of the Apple tree, the bark of which splits, and underneath is an erumpent stroma (black perithecium) subcarbonaceous externally, said to be fleshy within. The leaves of a Pear tree which are attacked by this fungus are previously attacked by the leaf fungus Actinema cratægi orbiculatum, and the fruits in such case are attacked by the Fusicladium dendriticum. The opinion now seems to be that the Actinema is the forerunner of the other, and an earlier stage of it. I should be very glad if Mr. Abbey would tell your readers whether this fungus on the young wood with the black perithecium is the one to which he intends to refer to, and apparently considers to be Fusicladium dendriticum. In my younger days it used to be called Dothiora pyrenophora of Fries.

I should also be obliged if Mr. Abbey has been able to find Nectria ditissima on the roots of Apple trees, and what are the factors which produce canker on the root. I have often found roots of trees the top growth of which is badly cankered perfectly free from canker. I may add that both the Dothiora and the Fusicladium dendriticum are the

food of the beetle mite Oribata orbicularis.—H. P.

In your number of July 20th Mr. Abbey has incorrectly, and I think unfairly, quoted my letter to you, published on page 498 of your journal.

Firstly, he states that I gave no reasons for coming to the conclusion that insects and fungus were due to the disease (canker), and not the disease to them, whereas I stated that "I had tried insecticides and cleansing the wound," and as these did no good I abandoned the theory of insects and fungus.

Secondly, I said canker may differ—i.e., have a different form—on various soils and in different localities. Mr. Abbey says, "Just so; it is a question of varieties suited to different soils and localities." I did not apply the remark to particular varieties, but simply to convey that I could only speak of canker as it appeared in my own garden, as I had no knowledge of it anywhere else.

Thirdly, Mr. Abbey states my remedy to be cutting off the worst cankered branches and cleansing the remainder, but omits the chief remedy as stated in my letter, as I go on to say, "I pared off the top soil and round the stems of the trees as far as I thought the roots would reach to the depth of nearly a foot, and put some strong decayed farmyard manure on the top of them, covering it with the top soil to induce the trees to find their sustenance near the surface instead of striking downwards to the poverty-stricken and cankerous undersoil." "The result was a complete success."

Mr. Abbey goes on to say that if I had cut away all the cankered parts it is perfectly clear I should not be troubled with canker again. This I beg leave to doubt, as it does not agree with my own experience

of some trees from which I cut all the cankered parts away.

Fourthly, Mr. Abbey says that "Mr. Pendered cures canker in Gooseberry and Currant bushes by letting it have its run of them, and when they are no longer profitable roots them out and plants new trees," whereas I said "I did not try to cure them." As to whether the disease in them and Laurels is canker I am not sure, but I know it is similar in its operation, and believe it arises from the soil. Fifteen years ago I planted a hedge of Laurels upon a bank of made soil. They are now 10 feet high, and are most luxuriant in their growth, with scarcely a dead bough. Seven or eight years after I planted in the same garden a hedge of the same kind of Laurels on the level ground. These grew rapidly for a few years, but latterly whole branches have died, though they grow again near the bottom. With this example before me I think I am justified in attributing the disease to the soil and not to fungus.

Mr. Abbey's lengthy articles are, no doubt, very good from a scientific point of view, but I doubt whether they are not beyond the reach of the ordinary fruit grower, and I invite your readers to try the simple remedy contained in my letter on page 498 of your Journal, and I believe they will have the same success in destroying canker as I have.-

THOS. PENDERED.

SCARLET RUNNER BEANS NOT SETTING.

I CAN corroborate the experience of "T. S., Bristol" (Journal of Horticulture, July 27th, page 80). My Scarlet Runners at Ealing have also failed this year to a very large extent, notwithstanding constant and copious watering through the whole period of their growth. Sutton & Sons have noticed a similar thing at Reading, and I find the same is occurring in Dorset. Mr. Darwin observed that this species of Phaseolus often fails to set pods in the abscnce of bees, which are required to fertilise the flowers; whereas the French Bean is independent of them, being always self-fertilised, and consequently can be forced in winter. Moreover, the bees often secure the honey illegitimately by perforating the calyx from without; the humble bees come first and make the hole, the hive bees following suit and taking advantage of the holc.

That bees are scarce this year appears to be the case from the following extract from a letter in the "Daily News" of July 10th. The writer from Much Hadham, Herts, says:—"The present is one of the worst seasons ever known for swarms. Under ordinary circumstances I should have had at least a dozen swarms, but I have not had one. The bee crop is, like many other crops this year, almost a total failure."

-GEORGE HENSLOW.

I, LIKE "T. S.," have noticed that these Beans do not set so well as usual this season. In this garden we have rows which have run up 10 feet high, and to all appearances are the picture of health, having received copious supplies of water during dry weather and mulchings of partly decayed manure. Even now that we have had such delightful showers the Beans do not set as well as could be expected. Although plenty of the flower racemes are 1 foot in length, only a very few pods are forthcoming from the base. I am totally at a loss to understand the reason for this state of things, and am waiting for some scientific reason to be given.—E. MOLYNEUX.

THERE seems to be a very general complaint hereabouts concerning the non-setting of Scarlet Runner Beans. It is not often the plants grow so strongly and are in such good condition for bearing so early in the season, and the failure to set is all the more disappointing accordingly. From Breconshire I hear the same, or very nearly the same report. Curiously enough in the latter case a few pods did form at first, then comes a gap on the spikes, and now more Beans are setting again. In this locality they failed completely at first, and now are doing fairly well. As it happens our first pods are not more than two-parts the size they ought to be, imperfect pollination evidently being responsible for this malformation of pods.

I am under the impression the first flowers were, owing probably to the excessive heat in which they were partially developed, imperfectly formed, or at any rate deficient in pollen, this accounting for their dropping off prematurely. It is true humble bees are not nearly so numerous as usual, but if their assistance is needed in the case of the earliest flowers, why not also for those that follow? The common bees are working among our rows every day, but no humble bees. It is doubtful if a remedy for this non-setting can be suggested, and the chances are the same circumstances will not be noticeable again by the present generation of gardeners.—W. IGGULDEN, Somerset.

OUR Beans are in the same condition as those of "T. S., Bristol." The plants are a picture in health and robustness; they never know what it is to be in want of either drink nor food, and are very floriferous. But alas! how disappointing to observe a naked raceme with but a couple of pods at its base, and two flowers at the points, whose fate is

to fall like its predecessors.

For an hour I viewed the bees, both humble and hive, searching for nectar in these showy flowers. Out of the whole number only one hive bee entered the flower in front; they all seemed to alight outside between the calyx and corolla, and thus from one flower to the other they flew. I could not imagine how they obtained any honey, as both calyx and corolla are so closely united, until I plucked a few, and then found out the secret, of which many more are in quest. At the base of each corolla there was an aperture, drilled no doubt by these honey searchers, and into this hole they pushed their proboscis, and obtain the honey with greater ease than down the tube. The same thing is done to extract the honey out of the flower tubes of my Bouvardias, which soon get unsightly and wither.

The disturbance of the reproductive organs is the cause of failure. They are enveloped in a spirally twisted keel, which makes it awkward for the bees to enter, hence the reason for the short cut for hidden treasure. No doubt were the bees to enter the flower the right way a

better set would be the result.—J. D., Duffryn, S. Wales.

THIS important crop is unusually late and the gatherings sparse this season, few growers having picked pods before August. The cause is generally attributed to the droughty weather, and it certainly is the chief reason of the late and scanty crops. In the early part of the season the flowers are often defective, dropping wholesale; but it is not confined to that exclusively, as many racemes cast greater part or the whole of the blossoms at different parts of the season without forming pods. Stopped plants, as in field cultures, usually set the first flowers better and afford earlier pickings than those staked and unstopped. The latter, however, produces pods more abundantly later in the season, and this points to drought or starvation as the prime agent in non-setting. Mulched plants also yield a good crop when those in dry and poor soil are sterile, and plants in the open are often loaded, while those grown against walls or fences produce little beyond flowers.

The Scarlet Runner is merely a form or variety of the Dwarf or French Kidney Bean (Phaseolus vulgaris), a native of tropical and temperate regions; "universally cultivated but not anywhere clearly known as a wild plant" (Baker), and was introduced to this country in 1597 as a tender annual, yet it is much hardier than the Scarlet Runner (P. v. multiflorus). This is considered to be a native of South America, and it is a remarkable fact that the evolutions from it are much more hardy and prolific than the old type or common Scarlet Runner, and points to the necessity of originating new varieties and selecting those best fitted to the environment. There is considerable difference in the old variety both in hardiness of plant, setting, and productiveness, and by saving seed from those most profitable large growers have secured strains which are far more productive and certain in cropping than where saving seed indiscriminately is practised. It is also a notable fact that "runners" with the pods of French Beans are less hardy than Dwarf Kidney Beans generally.

As to the necessity of humble bees for effecting pollenation in Scarlet Runners, it is certain that in large towns, where these plants are grown

largely for ornament and use against walls, fences, and as screens, the abundant crops must be mostly, if not entirely, due to self-fertilisation. Indeed, it is doubtful if humble bees contribute to the setting of Beans, for in towns they are by no means plentiful, and French Beans set abundantly under glass when the bees are asleep. Besides this, the humble bees are never seen partial to Beans, and work most on wild plants, though they will visit exotics in cases of emergency, and sometimes damage Beans by boring a hole in the calyx to obtain the nectar more easily. In that case the flowers are not fertilised, and the seeds become abortive. Nevertheless, there is reason to believe that certain plants—that is, Red Clover, are dependent on humble bees for their fertilisation, and they may generally be regarded as useful allies through their conveying pollen from flower to flower.—G. ABBEY.

FRITILLARIA ARMENA.

AMONG the dwarf-growing Fritillarias, the species depicted in the illustration (fig. 17) occupies a prominent place. As the specific name implies, F. armena is a native of Armenia, and was introduced in 1878, but it is not generally well known in gardens. It is a charming little plant, growing about 6 inches in height. The flowers are brownish purple, and as will be seen by referring to the woodcut, are small, campanulate, and slightly drooping. They are usually produced in April. There is a yellow form of this species named F. a. fusco-lutea. This was introduced in 1887 and is a native of Smyrna.

The engraving was prepared from a sketch taken at the Royal Gardens, Kew, where the choicer Fritillarias can be seen in bloom during the spring and early summer. F. armena can be grown in sheltered positions on a rockery or border, or in pots in a cool greenhouse.

COOMBE COURT.

AMONGST the residences and gardens that so finely decorate the lower portion of the Duke of Cambridge's estate at Coombe, Kingston-on-Thames, there are few prettier or more admirably kept than is that under notice. For some years it was the residence of Mr. Watney, but now is the property of Mr. W. A. Bevan, one of a well-known banking firm, and Mr. Springthorpe is the able and esteemed gardener. The front or upper side of the grounds abuts on a new road that runs through Coombe Warren, and there are seen on the outer wall, which is most pleasingly covered with Ivies planted outside, evidence of the neatness which prevails within. The lower side of the grounds, probably one-third of a mile distant, abuts on to Coombe Lane, where a long line of close-trimmed Limc trees shows again the estimation in which order and neatness is held. The fine house, one of red brick, stands on the upper margin, and for that reason obtains some splendid views over the county of Surrey, the which spreads out south like a beautiful panorama.

In the grounds the eentre portion comprises two or three enclosures, in which cows luxuriate, whilst surrounding these are extensive shrubberies and walks, all admirably kept, and where there are many beautiful trees, that are not at all common, whilst there are some effectively planted flower beds on the upper terraces for the summer. In the spring it is possible to look down in divers places in the grounds of really grand masses of Rhododendrons, Azaleas, and other flowering shrubs, the which, even at remote distances, have been planted to be seen from the terrace. Kalmias do wonderfully here.

There are good walled kitchen gardens admirably cropped, and a large number of houses, in which fruit and flowers are well grown, whilst there seems to be not an inch of level ground in the place. A good tennis court has been formed, and, in spite of the sand which

forms so much of the subsoil, trees and shrubs thrive splendidly.

I was much interested in the fine wall of Cherries. The trees are in the best of health, very clean, and some of them reaching to the top of the 9-feet wall, also run from 12 to 16 feet in length, and in all cases were carrying heavy crops of fruit. They were all close netted; the nets, however, not hanging in immediate contact with the leaves, but held off from some 3 feet at the base, slanting up to the top, by long bamboo rods.

Asked whether much trouble had been found from aphis, Mr. Spring-thorpe said that when the points of the summer shoots were being infested, he cut them all bare back, had their trimmings carefully removed at once, and burnt, and the fly had since given no further trouble. Of course the fruit was a little less in size than usual, owing to the drought, but then none of the fruits had cracked, as is so

commonly the case, when rain is plentiful.

From the earliest variety, Early May, fruits for tarts were gathered early in May, and for dessert in the middle of the month. Early Rivers followed, then May Duke, Frogmore Bigarreau, Black Eagle, Bigarreau Napoleon, and latest the Old Bigarreau. The Cherry portion of the wall is about 100 yards long, and eapitally furnished throughout. In one part of the garden low down a standard Morello is fruiting heavily, whilst within 20 feet is another that has hardly a fruit upon it. Both were in full bloom in the middle of April, when as is well known one or two sharp white frosts prevailed. These frosts, erratic in effect, killed the blossom on one tree and left the other unharmed, yet both were apparently equally exposed.—A. D.

LIVERPOOL SUMMER SHOW.

JULY 26TH AND 27TH.

NEVER perhaps in the history of the Liverpool Horticultural Association has there been a better all-round Show than that which was opened on the Review Ground, Sefton Park, on Wednesday and Thursday last. In every class the competition was of the keenest character, and the exhibits numbered 100 more than last year. Although the large marquee in which the plants were shown covered some 3000 square yards, the entire space was fully occupied, the centre portion containing one broad stretch of beautiful foliage and flowering plants.

SPECIMEN PLANTS AND GROUPS.

Mr. Finch, gardener to W. Marriott, Esq., Coventry, secured the highest award for eight stove and greenhouse plants, having grand examples of Cycas circinalis, Kentias australis and Fosteriana, and

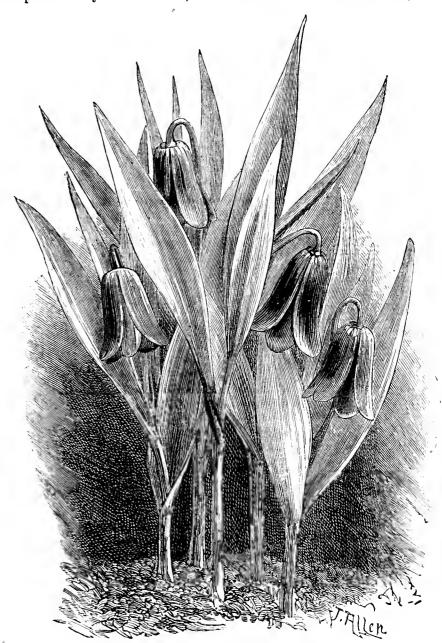

FIG. 17.—FRITILLARIA ARMENA.

a fine Croton Queen Victoria; Erica impressa, Phœnocoma prolifera Barnesi 5 feet across well flowered, Ixoras Fraseri 5 fect, and a grand salicifolia. Mr. Cromwell, gardener to T. Sutton Timmis, Esq., Cleveley, Allerton, was a close second, his grand Croton Queen Victoria 7 feet 6 inehes across being the admiration of all. This exhibitor also showed splendid plants of Alocasia Lowi, Statice profusa and Ixora Williamsi. Mr. R. Pinnington, gardener to Mrs. Banner, Blacklow House, Roby, was third in this class with smaller plants. There was a close competition between Messrs. Jellicoe, gardener to F. H. Gossage, Esq., J.P., Camp Hill, Woolton, and Healey, gardener to Col. Wilson, Hillside, Allerton, for six stove and greenhouse flowering plants, the former winning by the superiority of his foliage plants, which contained two magnificent bush Crotons Countess and Mortfortainensis, his best flowering specimens being Allamanda Hendersoni, Anthurium Andreanum. Mr. Healey staged beautiful examples of Crotons interruptus, aureus, and Queen Victoria; and Cycas revoluta, Erica impressa, and Allamanda Hendersoni. Mr. Leadbeater, gardener to W. J. Davey, Esq., Aigburth, a good third. Mr. Healey also succeeded in defeating Mr. Finch with four stove and greenhouse flowering plants, staging Allamanda Schotti, Erica Wilsoni, Ixora Williamsi, and Cypripedium barbatum. Mr. Finch had a fine Allamanda grandiflora. Mr. Bracegirdle, gardener to W. H. Watts, Esq., Elm Hall, Wavertree, being third. In the elass for three stove and greenhouse plants in flower, Mr. Jellicoe was first also for four fine-foliage plants, Mr. McFall and Mr. Healey taking second honours, whilst the latter succeeded in securing the prize for three Palms, Mr. Pinnington being

second. For one fine-foliage plant Mr. Cromwell staged one of the most charming specimens of Croton Williamsi it would be possible to see, grand in colour, 6 fect across. For one stove plant and one greenhouse plant in bloom Mr. Finch secured both prizes, the second honours going to Mr. Carling, gardener to Mrs. Cope, Dove Park, Woolton.

Ferns were admirably shown, the prize for six plants going to Mr. T. Gower, gardener to J. A. Bartlett, Esq., Lynton Lodge, Mossley Hill, the chief being Goniophlebium subauriculatum, Davallia Mooreana, and Dicksonia antarctica. A splendid second prize exhibit was arranged by Mr. Cromwell, his best being Davallia fijiensis, Nephrolepis davallioides furcans, and Microlepia hirta cristata. Mr. Bracegirdle was third. Mr. Cromwell took the prizes for three Fuchsias and one Fuchsia, showing In the class for three Ferns Mr. J. J. Craven, gardener to good plants. J. G. Grant Morris, Esq., Allerton Priory, was a good first, having Microlepia hirta cristata, 9 feet, and Gleichenia rupestris glaucescens, very fine; Mr. G. Eaton, gardener to W. H. Shirley, Esq., Allerton, being The prizes for one tree Fern and one (not tree) went to Messrs. Bracegirdle and T. Moorhouse, gardener to R. Brocklehurst, Esq., West Derby, the latter being first for one Zonal Pelargonium, and second for six Tuberous Begonias. The first honours for six Begonias and one went to Mr. T. Ankers, gardener to W. B. Bowring, Esq., Aigburth, for some of the finest varieties ever seen at the Show. With six Zonal Pelargoniums Mr. T. Gower was the only exhibitor. Ivy-leaf Geraniums, Caladiums, table plants, Gloxinias, Cockscombs, Coleus, and Liliums were admirable, the prizes going to Messrs. J. Stoney, gardener to Sir Thomas Earle, Bart., Allerton Tower; G. Eaton; J. Bounds, gardener to A. L. Jones, Esq., Oakfield, Aigburth; P. Greene, Eaton, Bounds, and Pattison, gardener to S. J. Waring, jun., Esq., Palmyra, Aigburth, in the order named, the latter winning with one Palm, Mr. Finch being first for one Erica.

There were four groups arranged for space not exceeding 150 square feet. In this Mr. Jellicoe was an easy first with a light central mound, and at intervals outside several smaller ones. There was a good ground-work of Maidenhair Fern, from which peeped small Francoas and other plants, the whole being edged with Panicum. Mr. Moorhouse, for second place, showed much improvement from anything he has done before, and should prove a difficult competitor at a future Show. Mr. Bracegirdle staged a very pretty group, but used scarlet Pelargoniums rather too freely, which impaired the effect. In the nurserymen's section, 250 square feet, Messrs. R. P. Ker & Sons, Aigburth Nursery, were easily first with a charming group. Mr. P. Poulton, Aigburth, was second. The prize for four Orchids went to Mr. J. Bounds with Cattleyas Eldorado Wallisi and virginalis, Oncídium craipum grandiflorum and vexillaria rubellum. Mr. Bracegirdle followed closely, his best being Cattleya Sanderiana and Disa grandiflora. Mr. W. Lyon was first with a single Orchid.

CUT FLOWERS.

Considering the season Roses came as a surprise to all visitors by reason of their excellence. The battle was fought entirely between Ireland and Scotland, Messrs. Cocker of Aberdeen winning in every class from Messrs. Alex. Dickson & Sons, the Royal Nurseries, Newtownards, Co. Down. In the class for forty-eight distinct they had charmingly fresh blooms. Messrs. Dickson & Sons had very good charmingly fresh blooms. Messrs. Dickson & Sons had very good Suzanne Marie Rhodocanachi, Mrs. John Laing, Alfred Colomb, Prosper Laugier, Louis Van Houtte, and Her Majesty. For eighteen Teas and Noisettes, Messrs. Cocker & Sons were first, and Messrs. Dickson second. For twelve cut Roses, six light and six dark, Messrs. Cocker & Sons were first with Her Majesty and Gustave Piganeau; Messrs. Dickson & Sons second with Marchioness of Londonderry and Alfred Colomb. For twelve cut Roses T. Raffles Bulley, Esq., Liscard, was first; Mr. J. M'Coll, gardener to J. W. Hughes, Esq., News Heys, Allerton, second; and Mr. J. Rimmer, Ashurst, Formby, third. The boxes of Roses arranged for effect showed a wonderful improvement. Mr. Carling winning with a beautiful a wonderful improvement, Mr. Carling winning with a beautiful arrangement arranged with Maidenhair Fern. T. Raffles Bulley, Esq., was second, and Mr. P. Greene third.

Stove, greenhouse, and hardy cut flowers were excellent, and the competition very keen. For twelve stove and greenhouse and twelve herbaceous flowers, Mr. Jellicoe won honours, the prize for twenty-four herbaceous going to Mr. G. Eaton for well arranged bunches; Mr. T. Coulton was second. The prizes for one and two bouquets went to C. J. Proctor, Esq. Dahlias and Carnations have never been seen in better condition, the prizes going to Messrs. H. Banks and A. J. Rogers. For Messrs. Sutton & Sons' prizes for Nemesia Strumosa Suttoni Mr. Harrison, gardener to Mrs. W. G. Bateson, Allerton, was placed first. The winner in the model garden class was Mr. A. Randall.

FRUIT.

Seldom has there been such a display of fruit seen at Liverpool, the Judges remarking that their duties had been of the most difficult description. For eight dishes of fruit, distinct, Mr. J. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, was gardener to the Earl of Harrington, Elvaston Castle, Derby, was accorded the premier position, having Madresfield Court and Muscat of Alexandria Grapes, small but well finished; Dymond Peach, Elruge Nectarincs (splendid), High Cross Hybrid Melon, very large; McLaughlin's Gage Plum and Moor Park Apricots. Mr. Bennett, gardener to Hon. C. H. Wynn, Rûg, Corwen, N. Wales, was second, showing fine bunches of Muscat of Alexandria and Black Hamburgh Grapes, not quite finished; Al Melon, Barrington Peaches, Pine Apple Nectarines The Czar Plum, Moorpark Apricots, and a good Queen Pine. For six dishes Mr. J. Stoney was first, staging grandly finished Muscat and

Madresfield Court Grapes, Têton de Venus Peach, Downton Nectarines, Masterpiece Melon, and Purple Gage Plum. Mr. W. Oldham, gardener to J. Beecham Esq., Ewanville, Huyton, for second position, had grand Buckland Sweetwater, and Black Hamburgh Grapes, Grosse Mignonne Peaches, Stanwick Elruge Nectarines, Blenheim Orange Melon, and Kirke's Plum. Mr. T. Elsworthy, gardener to A. R. Gladstone, Esq., Court Hey, Broad Green, was a good third. Mr. Stoney was also first for a dish of Peaches with Têton de Venus, for a scarlet-flesh Melon with Masterpiece, and with two bunches of Muscat of Alexandria, which with Masterpiece, and with two bunches of Muscat of Alexandria, which for size of perry and perfect colouring could not be surpassed. Mr. Coates, gardener to W. H. Verdin, Esq., J.P., Knutsford, Cheshire, was second; and Mr. J. Gray, gardener to Sir G. Meyrick, Bart., Bodorgan Anglesea, third. Mr. Bennett was an easy first for four bunches of Grapes, showing Buckland Sweetwater, Madresfield Court, Black Hamburgh, and Muscat of Alexandria. Mr. J. Grey, second; Mr. G. Middleton, gardener to R. Pilkington, Esq., Rainford Hall, St. Helens, third. Helens, third.

For two bunches of Black Hamburghs Mr. Middleton was awarded the silver medal and first prize from amongst ten competitors for what the Judges considered the best bunches ever staged at an exhibition; berries like Plums, good colour, and perfection in thinning were the qualities they possessed. Mr. J. Gray had larger bunches, well coloured, but smaller in the berry, a good third coming from Mr. T. Elsworthy. For two bunches any other black, Mr. J. J. Craven had perfect Madresfield Court black as Sloes; Mr. J. Bennett second; Mr. J. Barker, gardener to J. W. Raynes, Esq., Rock Ferry, third. Mr. J. Gray was placed first for any other white Grape with good Foster's Seedling; Mr. J. Wynn, gardener to J. Johnson Houghton, Esq., Westwood, Neston, second; Mr. W. Oldham third. Mr. Gray was first for green-fleshed Melon with Hero of Lockinge, Mr. Goodacre scoring with one Pineapple and Elruge Nectarines. The prizes for six dishes of hardy fruits and basket of fruit went to Messrs. G. Dutton and Stoney. Nectarines.

For twelve varieties, Mr. R. C. Townshend, gardener to Colonel Lloyd, Aston Hall, Oswestry, was placed first, his best dishes being Autumn Mammoth Cauliflower, Cranston's Excelsior Onion, Elcombe's Improved Parsnip, Intermediate Carrot, Sutton's Exhibition Beet, and Supreme Potato. Mr. J. Hathaway, gardener to the Earl of Latham, Latham House, Ormskirk, was a good second, having fine Globe Artichokes, Cranston's Excelsior Onion, Intermediate Carrot, Wright's Grove White Celery. Mr. J. Stoney third. For eight varieties Mr. J. Pownall, Prescot, was first; Mr. J. J. Craven second, and Mr. J. Stoney third. For six varieties Mr. Hathaway was again a good first; Colonel Lloyd second; Mr. J. Stoney third. The prizes for Peas went to Messrs. MacIver and Craven, the latter also winning with two dishes of Potatoes and Mr. Hathaway with four dishes. For three dishes of Tomatoes, one dish, and brace of Cucumbers the prizes went to Messrs. Forrester, Craven, M. Hannagan, gardener to R. C. Naylor, Esq., Hooton Hall.

NURSERYMEN'S EXHIBITS.

These were a feature of the Show, certificates of merit being awarded to Messrs. R. P. Ker & Sons for a variegated Hop, climbing Roses, and Rose Souvenir de Bonn; Dicksons, Ltd., for splendid assortment of herbaceous flowers; Mr. John Forbes, Hawick, for new white Carnation; Mrs. Cranston, Pentstemons, Hollyhocks, border Carnations, and herbaceous plants; Messrs. Hewitt & Co., Birmingham, for magnificent Begonia blooms; Messrs. Dobbie & Co., Rothesay, for Sweet Peas, Violas, Begonia blooms; Messrs. Dobbie & Co., Rotnesay, for Sweet reas, violas, Carnations, Marigolds and Dahlias, a choice exhibit; Liverpool Horticultural Co., for fine bank of Tea Roses, Orchids and Gloxinias; Mcssrs. Charlesworth, Shuttleworth & Co., Bradford, for a group of Orchids; Messrs. Thomas Davies & Co., for herbaceous flowers and vegetables; Mr. Henry Middlehurst, Manchester Street, Liverpool, for splendid spikes of seedling Gladioli; J. de Bels Adam, Esq., for a group of Tomatoes in 6-inch pots; and to Messrs. Laing and Mather, Kelso, Scotland, for a superb collection of Carnation blooms in variety, amongst them being the charming new variety Lady Nina Balfour, a flesh-coloured them being the charming new variety Lady Nina Balfour, a flesh-coloured self, sweetly scented and very attractive.

THE NATIONAL CARNATION AND PICOTEE SOCIETY.

NORTHERN SECTION.

THE annual Exhibition of this section was held in the Botanical Gardens, Manchester, on July 29th, and as all the other exhibitions in the South had taken place, it was somewhat a surprise to see so many flowers exhibited. There was only one Birmingham grower able to stage a few blooms, for Carnations in the Midlands were really over. The

following were the awards:-

For twelve Carnations, dissimilar, first, Mr. T. Lord, Todmorden, with a stand of superb blooms, consisting of Duke of York, Arline (very fine), Oscar Wilfred, George, S.B. (a grand flower, probably the finest bloom ever exhibited), Thalia, Master Fred (very rich in colour), Dan Godfrey, Seedling No. 12, Bruce Findlay (fine), Admiral Curzon, Thaddeus, and Biddy Malone. Second, Mr. J. Whitham, Hebden Bridge, with Robert Lord, Oscar Wilfred, Fanny Hudson, Master Stanlar Thalia Leganh Lakin William Dear (1997), Master Fred Stanley, Thalia, Joseph Lakin, William Dean (very fine), Master Fred, Wm. Skirving, Lily Cannell, Edward Rowan, and Admiral Curzon. Third, Mr. H. Geggie, Bury; fourth, Mr. E. Shaw, Morton, Manchester; fifth, Mr. G. Chadwick, Dukinfield.

For twelve Picotees, dissimilar, first, Mr. T. Lord, with Norman Carr, Thomas William, (a wonderfully fine bloom), Little Phil, Morna, (good), Zerlina (fine), Mr. Payne, Mrs. Gorton, Mr. Sharp, Mary D. Anstiss, (a superb bloom), Favourite, Campanini, and Alliance. Second, Mr. E. Shaw, with Little Phil, Nellic (excellent), Mrs. Open. shaw (Geggie's, a grand flower and will take a leading position), John Smaw (Geggle 8, a grand nower and will take a leading position), John Smith, Thomas William, Morna, Clara Penson, Favourite, Muriel (fine), Daisy, Mrs. Summers and Campanini. Third, Mr. J. Whitham. Fourth, Mr. A. R. Brown, Birmingham. Fifth, Mr. H. Geggie. Sixth, Mr. H. Pomroy, Stakehill, Manchester.

For six Carnations, dissimilar, first, Mr. Crossley Head, Hebden Bridge, with Master Fred (fine), George, Gordon Lewis (fine), Fanny Hudson, Joe Edwards, and Richard Bealey. Second, Mr. G. Tholorniley, Middleton, with C. H. Herbert, Joe Edwards, Master Fred, Young Meynill, Ivanhoe, and Thalia. Third, Mr. G. Maddock, Wakefield. Fourth, Mr. W. Kenyon, Bury. Fifth, Mr. Squire Greenwood, Hebden Bridge. Sixth, Mr. Joe Edwards, Blackley. Seventh, Mr. Pomroy.

Bridge. Sixth, Mr. Joe Edwards, Blackley. Seventh, Mr. Pomroy. Eighth, Mr. C. F. Thurstans, Wolverhampton.

For six Picotees, dissimilar, first, Mr. Crossley Head with Morna (good), Little Phil, Miss Wood, Thomas William, Lady Louisa (a very fine bloom), and Zerlina. Second, Mr. C. F. Thurstans with Dr. Epps (grand), Zerlina, Mary, Thomas William (very fine). Mrs. Sharp, and Campanini. Third, Mr. J. Edwards; fourth, Mr. W. Kenyon; fifth, Mr. B. Simonite, Sheffield; sixth, Mr. Thorniley; seventh, Mr. Greenwood; eighth, Mr. Meddock wood; eighth, Mr. Maddock.

For twelve selfs, first, Mr. E. Shaw, with Germania, Reuben Butler (two), Mrs. Muir, Lillie Shaw, Mrs. Fred, Mrs. Lee, and four seedlings. Second, Mr. A. R. Brown, Handsworth, Birmingham, with Ruby, Mrs. Fred, Attraction, Germania (two blooms), Wieland (two), Koerner, Patience, Aurora, Hebe, and Berenger. Third, Mr. J. Edwards. Fourth, Mr. T. Lord. For six selfs, first, Mr. Kenyon. Second, Mr. Pomroy.

Third, Mr. C. F. Thurstans.

For twelve Fancy Carnations or Picotees, first, Mr. A. R. Brown, Birmingham, with an excellent stand of flowers, made up from his fine remaining blooms on his plants—viz., Alice Brook, fine; Janira, Eclipse, Dodwell's Seedling 166, Richard Tryan, Romulus, Schleiben (two), Agnes Chambers, Lilian (grand), Stadrath Bail, and Terra Cotta. Second, Mr. B. Simonite, with Romulus and eleven seedlings. Third, Mr. Pomroy. For six Fancy varieties.—First, Mr. J. Edwards, with Harlequin, Jessica, Mrs. Robert Sydenham, A. W. Jones, Dodwell's Seedling 580, and a seedling.

In the single bloom classes the awards were as follows:—Scarlet bizarre.—First and fifth, Mr. T. Lord with George, and third with Duke bizarre.—First and fifth, Mr. T. Lord with George, and third with Duke of York. Second, Mr. E. Shaw with George. Fourth, Mr. G. Thorniley with C. H. Herbert. Crimson bizarre.—First and second, Mr. T. Lord with Master Fred. Third and fourth, Mr. T. Maddock with Edward Schofield. Fifth, Mr. C. F. Thurstans with Master Fred. Pink and purple bizarre.—First and second, Mr. T. Lord with Seedling No. 4, and third and fifth with Arline. Fourth, Mr. Maddock with Sarah Payne. Scarlet flake.—First, second, and fifth, Mr. G. Thorniley with Joe Edwards. Third Mr. Geggie, and fourth Mr. Simonite with William Dean. Rose flake.—First and fifth, Mr. T. Lord with Thalia. Second, Mr. Maddock with a seedling. Third, Mr. J. Edwards with Teddy, and fourth with Mrs. Gunn. Purple flake.—First, Mr. Lord with Gordon Lewis, third with Mayor of Nottingham, and fourth with James Douglas. Second Mr. B. Simonite, and fifth Mr. J. Whitham with James Douglas. James Douglas.

Picotees were shown thus:—Heavy red edge.—First, Mr. Lord, with Mary D. Anstiss, very fine, fourth with the same variety, and second with Morna. Third, Mr. Shaw, with Morna. Fifth, Mr. Thurston, with Dr. Epps. Light red edge.—First, second, and fifth, Mr. Lord; third, Mr. Thurstans; fourth, Mr. Shaw; all with Thomas William. Heavy purple edge.—First, Mr. Geggie; second, Mr. Thorniley; fourth, Mr. Shaw; all with Mrs. Openshaw; third, Mr. Lord; and fifth, Mr. A. R. Brown; with Muriel. Light purple edge.—First, third, and fourth, Mr. Thurstans; second, Mr. Brown; and fifth, First, third, and fourth, Mr. Thurstans; second, Mr. Brown; and fifth, Mr. Chadwick; all with Mary. Heavy rose edge.—First, Mr. Brown; second, Mr. Thorniley; both with Mrs. Payne; third and fifth, Mr. Lord, with Mrs. Sharp; fourth, Mr. Kenyon, with Little Phil. Light rose edge.—First, Mr. Thorniley; second, Mr. Kenyon; and fourth, Mr. Brown; all with Nellie; fifth, Mr. Shaw, with Favourite.

The premier Carnation was a grand bloom of George, from Mr. T. Lord; the best Picotee being a superb bloom of Thomas William, also from Mr. Lord.

A first-class certificate was awarded to Mr. T. Maddock for Edward Schofield, a fine high coloured crimson bizarre Carnation in the style of Joseph Lakin. A certificate was also awarded to Mr. Joe Edwards for a dark maroon self Carnation of fine form, petal, and substance, and named Mancussian.

TRADE CATALOGUES RECEIVED.

The "Acme" Chemical Company, Limited., St. Stephen's Street, Tunbridge.—Weed killers, Shading, Anti-Fungi Powder, &c.

L. Spath, Baumschule, Berlin .- Bulbs and Miscellaneous Plants.

HARDY FRUIT GARDEN.

Preparing Ground for Strawberry Planting.—The nature of the ground on which future crops of Strawberries are intended to be grown must be first taken into consideration. Poor soil is of little use for such a gross feeding plant as the Strawberry, but it is possible with too much manuring and good soil combined to form a rooting medium which will favour the growth of foliage at the expense of fruit. Adding manure to ground already full of humus is the most likely to be productive of gross growth in Strawberries. Such soils should be deeply dug and the whole bulk of material to the depth of 18 inches well

The Best Soil.—The best soil for Strawberries is undoubtedly that of medium quality and richness. What are usually termed holding loams are good, as well as heavy soils not naturally stiff or wet to any extent. Such soils encourage a firm and steady growth, not over-luxuriant but strong and favourable to fruitfulness. If deeply dug and freely manured for any recent crop, such as early Potatoes, very little need be done in order to prepare the ground for planting beyond completing the removal

of the crop, afterwards forking and levelling the surface.

Light Soil.—On very light gravelly soils it will be advisable to again manure the plots intended for Strawberries, giving a heavy or light dressing according to the special requirements. As the ground should not be too loose when the plants are placed permanently out, its preparation may take place a week or two previously, compressing the surface into a firm condition at planting time by the simple operation of treading with the feet, but only when dry or crumbly. If obtainable the addition of clay or marl to light soils will greatly improve them.

Wet Soil.—Wet soils need special preparation, the subsoil being made free and open to allow superfluous water to drain away readily. Should water collect within 3 feet of the surface nothing will make the soil fit for Strawberry culture but draining. Damp soils produce foliage at the expense of fruit, and the latter when produced, except

perhaps in very dry seasons, is subject to mildew.

Heavy Soil.—Many soils, usually stiff and heavy, only require working well to be admirably suited for Strawberry culture. Adding sand, road scrapings, or fine coal ashes together with thorough and frequent moving and mixing will bring them into suitable condition. Ridging roughly in the winter to expose as much surface as possible to the action of frost tends to hasten the amelioration of such soil. A season's cultivation is often requisite with the most obstinate and retentive soils. It is little or no use planting if the ground is not friable. Better continue to work the ground during the autumn, winter, and spring, planting at the latter period if the results of thorough cultivation are sufficiently evident to warrant it.

Manure.—Farmyard manure is usually the best to work into the ground, not applying it, as a rule, in a fresh state or fully decomposed, but partly decayed, it then containing its most important constituents. For light soils cow excreta is good, and for very heavy retentive ground farmyard manure containing a large proportion of strawy

material is excellent.

Trenching Ground.—It is not wise to follow immediately an old bed of Strawberries with the same crop again. If, however, it be absolutely necessary to do it the best plan to adopt is to pare off the strong clumps of plants, leaving the mass of rooted cunners, if not wanted, and weeds to be trenched in. The nature of the subsoil must determine whether ordinary or bastard trenching should be carried out. Poor subsoil must not be brought to the surface, and the rich buried deeply. In bastard trenching properly done the layers of soil will practically remain the same. Work in plenty of good manure, also trench any hard or weedy ground. The deep moving facilitates the passage of air and water through it, and an opportunity is afforded of burying troublesome weeds, except such as Bindweed or Couch Grass, which ought to be picked out as trenching proceeds. The sooner the ground for this season's planting is prepared the better.

Planting Strawberries .- In order to secure early and heavy supplies of fruit from young plants the first year it is imperative that early planting be adopted, and that the best, strongest, and most vigorous rooted plants only be inserted. Runners rooted carly in pots, turves, or mounds of soil will supply plants in the right condition. Plant during the first two weeks in August, choosing if possible a dull period with the surface not wet. If dry weather prevails at the time of planting draw rather deep drills, placing the plants in these so that cach may be in a slight depression or basin in which water can be poured to enable them to become readily established.

After Treatment.—Along with fresh growth runners will form and extend, but nip them off closely and regularly as they show. The Dutch hoe run frequently between the rows will loosen the surface soil, destroy

seedling weeds, and promote growth of the plants.

Distances to Plant.—The exact distances between the rows and plants vary with the different varieties and soils. The width between the rows containing the strongest growers may in good soil be 3 feet. For robust growers have the rows $2\frac{1}{2}$ feet asunder, moderate growing varieties being allowed 2 feet. The distances between the plants in the rows may be 6 inches less in each case. On poor ground the rows and plants may be a little closer. Insert any spare runners or small plants 6 inches apart in nursery beds. These come in useful for spring planting.

FRUIT FORCING.

Peaches and Nectarines .- Early Houses .- The leaves on trees started in December and early January are now beginning to fall, and there is great danger of over-maturity of the buds or their premature excitement, which, followed by a check however slight, causes them to drop. The trees must not lack moisture, affording water or liquid manure to those that are weakly as it becomes necessary. Excessive moisture at the roots, however, is liable to cause premature growth in the buds, Excessive moisture which must be guarded against by cool treatment and judicious management. There is little danger of the borders being made unduly wet by rain, provided the drainage is thorough and the soil sufficiently furnished with gritty and calcareous matter. Allow such laterals as are green and unripe to remain as an outlet for any excess of sap; they are the best safeguard against starting the bloom buds, and equally effective in maintaining activity at the roots. Early forced trees form far too many blossom buds as a rule, so that there is comparatively few wood buds, and these mostly confined to the base and extremity of the shoots. Neither is the growth strong, hence in pruning it is not desirable to cut back next year's bearing wood unless the shoots are of great length.

Where disbudding has been attended to, no more wood being trained in than is required to replace the bearing shoots of the current year and to renew worn-out growths, as well as to provide for the proper extension of the trees, very little pruning will be needed. Indeed, trees that have long been subjected to early forcing frequently become so enfeebled as to need the removal of the weak growths, which afford much smaller fruit than is yielded by the moderately vigorous and well-ripened shoots. Such trees, if very weak, may have the old soil carefully removed from amongst the roots, supplying fresh rather strong calcareous loam in its place. Any trees which grow too luxuriantly must be lifted and the roots carefully laid in fresh soil, if necessary, near the surface. Give a good watering to the trees that have had the soil renewed about the roots, also to those which have been lifted. These operations require to be performed as soon as the leaves are mature and before they fall from

Succession Houses.—Cut away the shoots that have borne fruit unless required for extension, and thin the growths where they are too crowded. This will allow of the thorough cleansing of the foliage with water from the syringe or engine, repeating as necessary, so as to keep the foliage and wood free from insects, preserving the leaves in health as long as possible. The freer access of light and air will also assist the perfecting of the buds and ripcning of the wood. Attend to a due supply of water at the roots. Where the fruit is ripening a free circulation of air will enhance the quality considerably, sufficient water only being given at the roots to prevent the foliage becoming limp, and securing air moisture by occasionally damping the surfaces. If the trees suffer from dryness at the roots the fruit ripens prematurely, and an arid atmosphere induces red spider and mealiness in the fruit.

Ants are particularly voracious this season, and eat into the choicest and best fruits, preferring Nectarines to Peaches, and especially Lord Napier Nectarine. The ants are attracted by partially picked bones laid near the haunts, and when smothered with ants the bones are dropped into boiling water. After the bones are drained and parted with the water they are eligible again as baits. To prevent their ascending the trees strips of "honey fly gum paper" may be wrapped around the stem, securing with string, but this is not necessary, only let the strips overlap and keep close round.

Late Houses.—The wood is best somewhat thinner than is usually allowed in earlier houses, for it does not ripen so well generally. By allowing plenty of room the foliage assimilates the sap better, more food is stored, and the buds form perfectly and the wood ripens well, other conditions being favourable. Gross growths must be stopped, or better removed altogether, for they only impoverish the weaker by appropriating an undue amount of sap, preventing its equal distribution, and favouring nothing but unfruitfulness and gumming. Endeavour, therefore, to secure an equal balance of moderately strong short-jointed growths, and to insure their ripening ventilate freely in the morning, and allowing a good heat from sun through the day, closing in time to run up to 85° or more. Admit a little air before nightfall to allow the pent-up heat and moisture to escape, and the atmosphere to gradually cool, thereby securing rest. This and the early ventilation promotes the solidification of the wood and its ripening. Forcible syringings will be necessary until the fruit commences ripening to keep the trees free from red spider. The borders also must be well supplied with water or liquid manure, and a light mulching will further surface rooting, as well as assist in keeping the soil regularly moist, and at the same time affording nourishment.

Melons.—Late Fruit.—If Melons are required very late seed should now be sown. Plants from this sowing will be fit to put out in about a month, and setting their fruit in September will afford Melons in November and to the new year. This, however, can only be effected in a light, airy, well-heated structure, and not always then, for Melons abhor the autumn mists and fogs. Bottom heat is absolutely necessary, and is best furnished by hot water pipes in a chamber, as fermenting materials induce too much vigour in the plants, and decline in heat vien most is required.

Late Summer and October Melons.—To ensure these the plants must

be placed out at once, giving them about a couple of barrowloads each of good loam, with a sixth each of horse droppings and old lime rubbish intermixed. Make the compost very firm, and have it in a moist state before planting. Strong plants, watered the previous night, only are suitable, for it is far more difficult to produce late than early Melons. Encourage the plants to make free growth by syringing at closing and damping surfaces in the morning and evening of hot days. Ventilate between 70° and 75°, and keep the temperature through the day at those figures by artificial means, 85° to 90° from sun heat, and close so as to raise the heat to 95° or 100°, allowing it to fall to 65° through the night. The plants will show and set fruit upon the first laterals, and the plants being almost at fruiting stage when put out, this will speedily be effected.

Plants Swelling their Crops.—Overcropping ruins more Melons than anything else, therefore reduce the number of fruits when fairly swelling to two on a weak plant, three on one moderately vigorous, four on a strong, and six on large and strong plants. Overcrowding the foliage is equally disastrous to the quality of the fruit, for it requires all the solidity that can be given to it, and to effect this the growths must be kept fairly thin, all having full exposure to light. Stop the laterals to one joint, and where this is likely to result in crowding thin them. Earth up the plants as the roots protrude, less soil being needed than earlier in the season, and afford copious supplies of liquid manure, always weak and tepid. Syringe from 3 to 4 P.M. or earlier, and then raise the temperature from sun heat to 95° or more. With due supplies of water at the roots shading will not be necessary, or only after dull weather, when a light shading will be of benefit from powerful sun until the plants become inured to it. It may also be needed when the houses have the ends north and south, and the sun is powerful on the west side. Place supports to the fruits in good time, and slanting so that water will not rest upon them.

Fruit Ripening.—A dry atmosphere is essential to secure quality and prevent the fruit cracking. Admit a little air constantly, maintaining a circulation by gentle warmth in the pipes, and employing enough artificial heat to keep the temperature at 70° to 75° by day, advancing 10° to 15° from sun heat, and to prevent its falling below 65° at night. Withhold water from the roots, but the foliage must not flag or the quality of the fruit will be seriously deteriorated. Where there is fruit swelling in the house an occasional damping will be necessary for the benefit of the foliage, and it will not affect the ripening fruit disastrously if plenty of air is afforded.

Late Plants in Pits and Frames.—The setting of the fruit should now be effected, to allow time for its swelling and ripening. If necessary give a good watering before the flowers open, and line the sides of the frame and bed with hot manure. Give a little ventilation constantly at the top, so as to prevent the deposition of moisture on the blossoms, and continue it until the fruit is set and commences swelling. Impregnate the blossoms daily, and when sufficient fruits are obtained remove all flowers, and afterwards keep the growths well stopped and fairly thin, so that they have plenty of air and light. Maintain a moist and warm atmosphere to assist the swelling of the fruit, closing early with sun heat, and sprinkling the plants on fine afternoons. Water will be required twice a week in bright weather, but supply it sparingly or not at all when dull, and admit a little air to prevent a stagnant atmosphere. Ventilate early on fine mornings, and maintain a temperature ranging from 80° to 90° through the day from sun heat. If sunny weather prevails and the heat is properly maintained by linings the fruit will be good often up to November.

PLANT HOUSES.

Bignonia grandifiora. — In 5-inch pots this plant flowers profusely and is very useful for various decorative purposes. Cuttings of young wood root freely in houses where a fair amount of moisture is maintained. The plants should be well ripened and rested in a cool house. When started into growth in the spring an intermediate temperature suits them well if fully exposed to the sun. The wood made must be firm or else the plants fail to flower.

Gloxinias.—Plants raised from seed sown late in the spring and now in small pots should be transferred into others 4 and 5 inches in diameter, according to their size. These, if shaded from bright sunshine and grown close to the glass in cold frames, will make excellent decorative plants a few months hence. Few plants when well grown are more effective. By starting the tubers at intervals of a month and raising seedlings, a very long succession of bloom can be obtained. Plants that flowered early and have enjoyed a good season of rest may be started again into growth. They will soon commence to grow in any structure that is kept moderately close. The plants may be flowered in the same pots.

Tuberous Begonias.—Seedlings may be grown in cold frames, for although they may appear to be late they will make wonderful progress, and flower profusely during October and November if placed in a warm house close to the glass where the atmosphere is kept moderately dry. The flowers of these Begonias are very useful for house decoration. They are easily bruised, and therefore do not travel well.

Nertera depressa.—This is really a charming little plant when well grown and covered with its coral-like berries. Plants that have berried well, and have started again into growth, may be broken up and dibbled thickly into small pots or pans, the latter being best when needed for table decoration. This plant grows freely in any light moderately rich soil, and should be kept moist until well established in an intermediate temperature. By autumn the surface of the pots or

pans will be covered with growth, and if well watered we find the plants winter well on shelves where the temperature does not fall below 45°. In spring a fair amount of air and full sunshine should be afforded

them, when they will be found to berry freely.

Celosias.—Plants for autumn and winter now in 3-inch pots, and may be transferred into 5-inch without delay. Grow the plants in frames where they can enjoy a liberal amount of air. They should not be hurried in their last stages or they will be almost certain to damp at the base when arranged in conservatories and other structures.

Asparagus deflexus.—However effective and useful other varieties of Asparagus may be for furnishing in pots and for supplying greenery for cutting, A. deflexus is a handsome basket plant. It is very distinct in appearance, and its fairly long feathery shoots droop gracefully over the sides of the basket. This is certainly a great gracefully over the sides of the basket. This is acquisition to the numerous basket plants at disposal.

Epiphyllums.—These, if assisted by gentle warmth to make their growth, should now be fully exposed to the sun, and at the same time be given abundance of air. They flower profusely when the growths are thoroughly ripened, which is best accomplished by exposure to light and air and not have been supported by the same time. air, and not by the barbarous system of drying them at their roots until the plants shrivel. Where stage room is limited these plants do well grown in pots suspended from the roof by means of wire. In this position they do not suffer so quickly from the drying conditions of the atmosphere as many other plants. Even in baskets the plants do very well, providing they are not overwatered. If strong stocks of Pereskia are at hand they may be cut into lengths and inserted in small pots. well, providing they are not overwatered. It strong stocks of Pereskia are at hand they may be cut into lengths and inserted in small pots. If pieces of Epiphyllum are attached on the top and then stood in the propagating frame they will unite by the time the stocks are rooted. Grafting is easily effected by splitting the stock at the top and the removal of the bark from the scion, or by placing pieces on each side after removing a portion of the stock, so that the two barks come together. When placed on each side of the stock, and each scion pointing outwards, they form good shaped heads much quicker than when ing outwards, they form good shaped heads much quicker than when one piece only is attached.

APIARIAN NOTES.

Notes from the Moors-Swarming.

During the two first weeks of my stay at the moors, amidst very boisterous weather, I have had not less than eight unexpected swarms. One hive sent off a swarm that had several young queens living together for six weeks, which is another lesson of the many I have had not to put trust in bees killing the supernumerary queens by returning swarms. The above case is the most extraordinary one I have experienced, but it is not uncommon. The Heather is gorgeous, but it was midday on July 27th before the honey began to flow, which has been of short duration, as the morning of 28th dawned with an overcast sky and low temperature.

Where do drones congregate? Ancient writers on bees tell us that drones ascend to the top of the highest hill near the apiary for the purpose of meeting queens. The 23rd of July being a fine day with the exception of a drizzling rain at intervals, drones were flying in great numbers. Being also a likely day for queens to be on the wing I ascended by a ridge to a height of 1400 feet above sea level and from 300 to 400 feet above the bees. In the bosom of two prominences and at a great height the drones were in myriads and the humming they made was converted into a roar. By their quick movements and darting at each other proved that our early observers were a great deal more accurate in their observations than many modern writers.

PUNIC BEES.

I hope to be able with these bees to prove an important point, that is whether being bred at so high an altitude they will become acclimatised, and consequently hardier. But although a writer tried to impress us with the belief that Punic bees being natives of a warm country were tender, I have not found them so. I have one of my queens that was imported in 1891 still alive and breeding well, and I know of six others. This is proof that Punic queens are long lived and very prolific. The queen referred to has been at the Heather here for three years, which doubly taxes the laying powers of queens.—A LANARKSHIRE BEE-KEEPER.

SWARMS NOT WORKING.

I HAD a swarm of bees on May 6th, which began to work well until about a month ago, when they appeared to stop working, and I never see any workers among them. The bees are still in the hive, and they have a little comb, there being a large number of them, but they do not work. I commenced to feed them, but it did not make any difference to their working. I had another swarm on the 22nd of May, so I put them in a much larger hive.

They did well, filled the hive, and they are still working, having commenced to fill a cap I placed on the top of the hive. first swarm I sometimes see the bees fighting with much larger ones in the same hive. If "A Lanarkshire Bee-keeper" would kindly advise me what to do I should be much obliged, as the time of year is drawing on, and I am afraid they will not fill their hive with comb for the winter.—F. J. W.

[The key to enable me in your case to give a proper explanation is wanting. Prime swarms often issue with an effete queen, so that it is no better than queenless, and not unfrequently with one or several young ones, which always run the risk of being lost or The swarm under such remaining unfertile for several weeks. conditions throws off a portion of her bees, which renders the original one too weak to be of much use for the present season, being with a young and fertile queen too intent on breeding. Examine the hive or watch the entrance for young bees at a time when rallying, and if these are present feed till full of comb and of proper weight to stand the winter. It then ought to be an excellent and profitable hive for next season. Make it a rule in your apiary to have no queens older than from ten to twelve months, and you will be pleased with the little extra labour and save disappointment. Your hives will also be in the best possible condition for gathering honey with the minimum amount of swarm-Raising nuclei and deposing old queens early in the season constitute sensible work for the current year as well as for the following season.—A. L. B. K.]

GARDENERS' CHARITABLE AND PROVIDENT INSTITUTIONS.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION .- Secretary, Mr. G. J. Ingram, 50, Parliament Street, London, W.C.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY .-Secretary, Mr. W. Collins, 9, Martindale Road, Balham, London, S.W.

ROYAL GARDENERS' ORPHAN FUND .- Secretary, Mr. A. F. Barron, Royal Horticultural Society's Gardens, Chiswick, London, W.

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened We request that no one will write privately unavoidably. to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Poetry (Fleur).—We are unable to inform you in what book the lines you send occur.

Presentation Book (Flora).—If the gardener to whom you kindly wish to present a comprehensive book does not possess "Thompson's Gardeners' Assistant" it would be a very useful and appropriate gift. It is published by Blackie & Sons, and can be obtained through a

Mealy Bug on Vines (A.J.).—Your letter arrived too late to be fully answered this week. Do the best you can with a forcible jet of water and the aid of a pointed stick for dislodging the insects before sending the bunches to table, allowing time after the unenviable operation for the berries to become dry before dishing the fruit.

Chrysanthemum Leaves Failing (Chrysanthemum). — It is possible that the bones, if raw, also the excessive use of the guano, have had a deleterious effect. An application of clear lime water could not do harm, and might do good, followed by a solution of soda as advised to another correspondent. The leaves shall be examined The leaves shall be examined microscopically.

Chrysanthemums (Bob).—The crown buds showing now will give larger and earlier blooms than you are likely to obtain from the terminal buds. We do not know in what way you can retard the flowers of Madame Desgranges other than keeping the plants in the coolest position you can find, but not under trees. Many plants are producing buds sooner than usual this year through no fault of their cultivators.

Tomatoes Diseased (A. A. B.).—The specimens did not arrive in time for the requisite examination being made for the purpose of reply in the present issue. The case shall have attention.

wireworms in Vine Border (J. J.).—These not easily destroyed pests are no doubt injuring your Vines. Pursue sedulously your practice of inserting baits of Potatoes and Carrots, withdrawing them frequently for securing the depredators. We have known squares of fresh turf buried in the soil even more effectual than the roots mentioned. We have heard that sowing Mustard seed on wireworm-infested land and allowing the plants to grow has in some mysterious way acted beneficially, but catching the pests is the most certain mode of riddance.

Cucumbers Failing (Hampshire).—The disease in the roots is caused by minute nematoid worms, and they may be communicated with soil, manure, or water. We fear your plants are beyond recovery. Heating the soil to 212° destroys parasitic germs. An experienced cultivator has found that practice, then mixing with each bushel of the soil a pint each of steamed bonemeal and soot, and a quart of wood ashes, keep his plants in health and free from this destructive visitation. Every part of the house should be thoroughly cleansed, floors and walls of the pit washed with hot lime. You do not say, however, whether the plants are grown in pits or frames.

Potatoes for Montevideo (Quintero).—It would be impossible for anyone to name a solitary variety as the best for your purpose. Possibly you are right in assuming that early varieties may answer the best in sandy soil because of the risk of drought more prejudicially affecting the later crops. Even in this country the best varieties for particular soils and localities can only be ascertained by experiment, and so it must be in your case. Potatoes of American origin would be likely to answer the best, such as Early Puritan, Early Rose, Beauty of Hebron, Extra Early Vermont, and Charles Downing. Of good-sized tubers (and it would be a mistake to plant small ones) half a ton will be needed to plant an acre of land in rows 27 inches asunder and 12 to 15 inches in the lines. We do not know of any small work on Ferns such as you appear to require. Possibly the Director of the Royal Gardens, Kew, might be able to advise you on the subject, and we are sure he would be willing to do so.

Melon Leaves Diseased (Subscriber).—Yes, the Melon leaf subjected to microscopic examination is "smothered" with a disease caused by a fungus-like creature allied to that which produces fingerand-toe in Turnips and clubroot in Cabbages. But it is higher specialised than that fungus (Plasmodiophora brassicæ), for, though this curious group of fungi, called Myxomycetes (to which finger-and-toe fungus belongs), have the power of movement by changing their forms, like the low microscopic animals called Amæbæ, it possesses the power of locomotion in a higher degree, and is capable of attacking any part of the plant. The malignant bacteroids causing disease in Melons, Cucumbers, and Vegetable Marrows sometimes attack the stem only, level with or within a foot of the ground, and the plants so attacked collapse as suddenly as those infested at the roots. the roots and stem intact, fastening on the bines here and there, and causing a swelling, with sometimes an exudation, which is due to the ferment set up by the bacteria, and in other cases it may infest the leaves only. In the latter case the leaves are usually thick in texture and abnormally green and healthy in appearance, but this gives place to a jaundiced hue, and transparent yellow pustules appear on the upper These soon shrink, forming specks, and the leaves turn rusty and collapse, the midribs and footstalks remaining intact; all the same, the plants die, apparently healthy at the roots, in the stems, and even bines. If the plants are examined they will be found to have no (or only small and discoloured) nitrogenic nodosities on the roots, which is a common case where fermenting materials are employed for bottom heat, and we may assume that the bacteroids which convert free nitrogen into the form by which it can be assimilated by the plant are not present. This is a vital point in proving that the presence and vitality of the micro-organisms which give rise to the root-tubercles is the indispensable factor by which atmospheric nitrogen is taken up and elaborated. It is still further necessary to show that the malignant bacteroids do not attack the roots, stem, bines, footstalks, and midribs of the leaves because This is seen in the case under they contain assimilated nitrogen. notice by the micro-organisms concentrating their forces on the parts where the free nitrogen enters the plant, which can only take place by the parts above ground, and most freely by the leaves. On examining thinner tissue of the leaf, where the free nitrogen must enter most and freest, we found the stomata swollen and closed, and the hairs remarkably short, blunt, and stunted, whilst they were almost entirely wanting on the thicker portions. In the interior of the latter the bacteria were very abundant, but not so much so as to cause the sudden collapse or decay of the affected part, for there were some perfectly healthy cells, but most had been invaded, and we anticipate the drying up and falling away of those parts of the leaves as if scorehed, leaving the midribs and footstalks intact. The plants, however, will positively refuse to grow, though their roots and stems appear perfectly healthy, and they, with their fruit, gradually wither. The fruit ripens prematurely, and the seeds are for the most part very defective, if, indeed, they store sufficient matter to effect germination. The seeds, however, are not in any way affected by the bacterial affection, and the disease will not show itself in the progeny. It is not by any means a new disease, for it has been known in England more than a century, although

diseases of this nature have only received the attention of bacteriologists within the last quarter of a century.

Bones Becoming Putrid and Maggotty in Chrysanthemum Pots (W. A. M.).—This is a very common occurrence this season, many plants being ruined by the broken bones employed as drainage to the pots at the time of the final potting having become putrid, alive with maggots, and emitting a stench. The bones, though perfectly dry and in excellent condition when received, soon become decomposed when moistened because they have undergone a process of fermentation so as to render the gases they contain more readily available for the plants. Such bones, however, should never be used for drainage, nor, indeed, any bones, for all are liable to ferment and foster the development of maggots. It is different when the bones are mixed with the soil; then the producers of the maggots cannot get at them, and the decomposition takes place much more gradually and they are likely to prove advantageous. There is nothing like a clean drainage composed of potsherds for Chrysanthemums. It is imperative to get rid of the bones, clearing every particle away, cleansing the pots, and using crocks only for drainage. The soil also that has not been occupied with roots should be removed, using fresh loam intermixed with lime rubbish and charcoal, as these, especially the old plaster, will have a tendency to sweeten the soil, and it will further be freed of sourness by watering the plants with tepid water in which 1 oz. of washing soda to 3 gallons has been dissolved. The sodic solution will saponify the fatty matter present in the soil, and this practice a large grower has found necessary to pursue with plants that were almost killed by indiscreetly using bones for drainage, which by the vendor were described as particularly strong

Arrangement of Grounds and Orchards (J. H. E.).small kitchen garden, 47 yards by 16 yards, would, as the ground is heavy, be best occupied with half-standard Plums. They would come into bearing soon and be profitable in a few years; plant in the autumn as soon as the leaves have fallen. The Czar, Belgian Purple, Prince Englebert, Gisborne's, and Victoria are suitable varieties, with Crittenden and Bradley's King Damsons. The spaces between the trees, which may be 15 feet apart, could be utilised with vegetables, or be temporarily planted with Strawberries or Gooseberries and other bush fruits. The drying ground must of course remain as it is, also the 43 by 40 yards orchard, which, however, seems to have many vacant places, especially on the west and north sides, but these, we presume, you intend to fill up by the trees you name. The 80 by 38 yards meadow might be planted with fruit trees, employing standards if you wish to have the use of the grass; but it is an undesirable practice unless the grass is eaten by calves or sheep, though it may be mown only. Manure is given after or before every crop, say not less than 20 tons of stable or farmyard manure each year. Apples would perhaps answer under such circumstances, provided the soil is well drained, along with the hardier Pears. It would, however, be much the best broken up, properly prepared, and planted in the autumn with bush trees, as the choicer varieties would have a better chance. Mr. Gladstone, Duchess of Oldenburg, Worcester Pearmain, King of the Pippins, Cox's Orange Pippin, Gascoigne's Scarlet Seedling, and Baumann's Reinette are desirable dessert Apples; and for culinary, Keswick Codlin, Lord Grosvenor, Potts' Seedling, Ecklinville, Queen, Peasgood's Nonesuch, New Hawthornden, Golden Noble, Prince Bismarck, Lane's Prince, and Bramley's Seedling. They may be planted 6 feet apart, but unless root-pruned they would require thinning in about six years, leaving them 12 feet apart, or plant them that distance at the commencement, and crop with vegetables between. Of Pears, Beacon, Jargonelle, Williams' Bon Chretiên, Beurré d'Amanlis, Durondeau, Beurré Superfin, Pitmaston Duchess, Maréchal de Cour, Emile d'Heyst, Doyenné du Comice, Beurré d'Anjou, and Josephine de Malines. You may gct shelter for these by planting the north side with Damson trees, also in the hedgerows, or by them, so as to break the force of winds. Of course trees can be planted in the 80 yards by 30 yards meadow on the grass, and they may be either Apples, Pears, or Plums as standards, and the hedgerows, except on the south, might be planted with Damson trees for shelter. Of the plans for the flower garden, No. 3 is the most simple, and by enlarging the beds, most likely to meet your requirements. There certainly is more accommodation for plants in No. 2, but Ferns are not likely to do any good on the south of the house, though other plants would do well on the rockwork. The beds in No. 1 are too near the house, where it is desirable to have grass next the gravel instead of bare earth—an everlasting eyesore. We cannot submit plans. Some good perennials are Adons vernalis, Allium pedemontanum, Alyssum saxatıle compactum, Alstromeria psittacina, Anthericum liliastrum, Aquilegia glandulosa, Armeria plantaginea rosea, Aubrietia græca superba, Calochortus luteus oculatus, Campanula aggregata, C. dahurica, C. glomerata alba, C. Van Houttei, Centaurea montana and var. alba, Convallaria majalis, Corydalis eximia, Delphinium nudicaule, Dianthus floribundus, Doronicum Clusi, Fuchsia pumila, Funkia lanceolata, Gentiana verna, Geranium Endressi, Geum Fremonti, Hemerocallis flava, Hepatica triloba vars., Hypericum calycinum, Iris germanica vars., I. orientalis, Lobelia fulgens, Lychnis dioica rubra plena, Mertensia sibirica, Narcissus Emperor, N. Empress, N. incomparabilis, N. poeticus ornatus and plenus, Enothera Youngi, Pæonia arietina vars., Papaver nudicaule vars., Phlox amœna, P. subulata vars., Polemonium Richardi, Pulmonaria azurea, Ranunculus aconitifolius plenus, R. bullatus plenus, Saxifraga Camposi, Sedum spectabile, Spiræa japonica, Trollius europæus, and Zauschneria californica. All are under, or not exceeding, 2 feet in height, and do not need stakes, but you should add Pinks, double Primroses, Hellebores, Auriculas, Mimulus, Pansies, Violas, Violets, and single and double Pyrethrums, with bulbs to have a good display.

Plums Decaying (James Brown).—The fruit is affected by Plum rot or the monilia of fruit (Monilia fructigena). It is recommended to spray the trees with Bordeaux mixture at a safe strength, say 2 ozs. sulphate of copper dissolved in a vessel by itself, 2 ozs. quicklime, slaked and formed into a thin whitewash, pouring this into the vessel containing the copper solution through a hair sieve. Stir well, and dilute to 3½ gallons. Spray when the fruit is a quarter grown, again when half grown, and just before commencing to ripen, yet prior to colouring. The only thing that can be done now is to collect and burn all the affected fruits and practise clean culture. Although there is a considerable amount of flocculent matter on the pieces of branch, it is not fungal, but preceded from the coole which are constant to the Shindle but proceeds from the scale, which appears to be allied to the Spindle-tree scale (Chionaspis Euonymi). Syringe the trees, as soon as the fruit is gathered, with noftsoap, half a pound dissolved in a gallon of boiling water, place in a 2-gallon stone bottle with a wineglassful of petroleum, cork, and agitate violently for five minutes, so as to churn the contents, then pour in a gallon of boiling water or a little less, so as to allow of mixing by shaking, pouring into a 4-gallon watering can, and add two gallons of hot water, mixing well with the syringe. When cool enough (100° Fahr.), syringe the trees, wetting every part with the emulsion, and repeat, if necessary, in ten days. In the winter, use the spray treatment according to the formula given in vol. i., page 251, of the Fruit Growers' Guide, to which you refer.

Names of Fruits.—Notice.—Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing. The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. (M. M. C.).—Apple, Duchess of Oldenburg. (W. J. B.).—2, Jolly Beggar; 3, Red Astrachan; 4, Sugar-loaf Pippin; 5, English Codlin. (B. W.).—White Joanetting.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (South American).—An Argemone, most probably a sport from A. mexicana. (H. W.).—Harpalium rigidum. (F. B.).—Calystegia pubescens. (Amateur).—Catananche bicolor. (J. F. Cranswick).—Rubus odoratus, a native of North America, introduced in 1700. (J. D.).—1, Saponaria officinalis; 2, Scutellaria galericulata; 3, Echium violaceum; 4, Rosa rugosa.

FARM ORCHARDS.

Now is the time to closely inspect farm orchards, to make a critical survey of each tree, so as to form a reliable opinion of its condition and requirements; to decide if it is or is not as healthy and as fruitful as it ought to be; whether it is capable of improvement under special treatment, or is worthless and a mere waster of valuable space. Seven such special inspections have we made recently, all of them highly important, showing, as they did, how general is the ignorance of the mere rudiments of fruit culture even in its most simple guise of the grass farm orchard. This is all the more deplorable from the fact that many of the trees of both Apples and Pears in such orchards have heavy crops of fruit this season, very much of which is so small as to be comparatively worthless for market. "The trees bear well, but the fruit is always small," said the owner of one of those orchards, and he went on to suggest root-pruning as a remedy! We had to explain that root-pruning is only required to repress undue vigour of wood growth; that his trees, with their heads grown into thickets, with no young wood growth now or for several years, with the whole of the branches heavily laden with fruit and thickly set with blossom buds, were in such a condition of exhaustion that fine fruit was an impossibility. The remedy was simply a judicious branch-thinning, with frequent and full doses of liquid manure to the roots.

We have no doubt that our advice is applicable to most old farm orchards throughout the land. It is a good sign that such advice is asked for so frequently now, but we fear it is not always applied so well as to do much good. It is so difficult for beginners to grasp the significance of a full dose of liquid manure. A mere surface wetting does no good; the whole of the soil about the whole of the roots must be dosed so persistently that it is fully supplied with plant food. To make sure of this it is poured over the whole of the surface under the tree and for fully a yard outside the radius of its branches. In some instances it is necessary to open a small trench a spade deep right round the tree under the tips of the branches and to make a few holes between this circular trench and the stem; then by repeatedly filling holes and trench with liquid manure it spreads and sinks deep enough in the soil to reach all the roots. There the orchard adjoined the homestead, from whence the sewer ran into a large cesspool overflowing with sewage in the lower part of the orchard. It had never occurred to the worthy farmer to turn this rich source of fertility to account, but he promised to do so at once and persistently. A supply of such excellent liquid manure is forthcoming at most farm homesteads; at many it is justly regarded as invaluable for grass land, and if enough cannot be spared for the trees

a splendid substitute can be had by dissolving in 40 gallons of water 1 lb. nitrate of soda, 1 lb. muriate of potash, and 2 lbs. superphosphate. This is an excellent fertiliser for all fruit trees and bushes, as well as for those in old orchards, but there especially do we recommend the combination of potash with the other salts, because of the too probable exhaustion of the soil near the trees.

At another farm, in an old orchard near the house an attempt had been made to gradually clear off and replace the old and much cankered trees with young ones. The soil was a cold heavy clay, and though the young trees had made some growth, it had cankered so badly that the restoration of the orchard was practically a failure. Evidence of the remarkable energy and ability of the farmer is afforded by the general excellence of the whole of the other crops on the farm, notwithstanding the long drought. He was not content to fail in even such a minor matter as the management of his crchard, and so came his appeal for advice. As usual, the remedy was a very simple matter; he has to discard the diseased trees, to open stations 6 feet square and 2 feet deep, to lay a row of 2-inch drain pipes across the bottom, to fill the stations with sound top-spit soil, using enough of it to allow for its gradually settlement to the common level, to connect the station drains with a central main drain running right through the orchard, and to plant strong healthy standard trees immediately after the leaf falls in autumn. To make stations in clay without outlets for water must lead to failure. The farmer's puzzle was why the orchard trees failed, while a dozen or more others planted at the same time in a hedgerow had made healthy growth and were bearing fruit. Upon going to the hedgerow we pointed out to him that the surface of a field on one side of it was quite 3 feet lower than that on the other side, there was no possibility of accumulation of water about the roots, and they were healthy thriving trees.

WORK ON THE HOME FARM.

Never was there a season when nitrogenous manures played such an important part as they have in this summer of trials and difficulties arising from the great drought. The application of the mixture of nitrate of soda, superphosphate, muriate of potash, and steamed bone flour to pasture during the last week of February told even better than usual, for the soil had been well soaked by the heavy rain of that wet month, and there was plenty of rain then and at the beginning of March to thoroughly dissolve and wash in the manure to the soil about the roots of Grasses and Clovers. A full hay crop thus became a certainty. It has repeatedly been so in other seasons when, although there has been no long drought, drying March winds have not been followed by April showers. Clearly, then, the lesson enforced once more is to apply chemical to all grass land about the last week in February. "But," we were once told, "it could not be done with snow upon the ground." It could, and with this advantage, that as the snow melts it carries the manure into the turf.

Nitrate of soda alone has also and is playing an important part now. With frequent showers free growth is a certainty if only 1 or 2 cwt. per acre of this splendid fertiliser is sown broadcast over hungry pasture, among catch crops, roots, or any other crops requiring a lift onwards. It is really lamentable to find so many graziers, with ruin staring them in the face, doing nothing of the sort to help them-Want of means? Surely not, for it is entirely worth while for a man to sacrifice something in order to obtain command of such a means of giving food to his hungry cattle and hope to himself. It is certain that wherever the soil has been well tilled in autumn and well stored with fertility that crops are highly satisfactory now. Equally clear is it that poverty of soil under the drought has led to a ruinous crop failure. Corn harvest is in full swing very generally south of the Trent. It is a month earlier than usual, and points to one of the finest opportunities for thorough autumn tillage we have had for many years. Let us try and turn it to full account.

FARMING AT HOME AND ABROAD.

THE following interesting note by Mr. Martin J. Sutton, of Kidmore Grange, appears in the Times of July 31st. Mr. Sutton says:-

"On my return home I find that very little improvement has taken place in the situation since I left in the last week in June. It would appear that, though the second cuttings of Clover leys will be improved, the root crops have not been so much benefited by the heavy rains of the last fortnight as might reasonably have been expected, while those

rains have done more harm than good to the corn. I should like to say a word on the condition of affairs on the Continent. I started on my usual journey abroad on the 26th of June, after travelling some hundreds of miles the week previous through some of the best agricultural districts of England. I was thus able to compare the agricultural conditions then obtaining in this country and those on the Continent. I have since travelled some 3000 miles by road and rail inspecting the crops in the north of France, Belgium, the Rhine Provinces, and Southern Germany. It is true that in all these countries the first hay crop was a comparative failure, and it seemed at one time that the roots might also be short. But I was agreeably surprised to find there the grass growing very rapidly for the second crop, and, excepting in parts in the north of France, the roots looking very well indeed. Rye this year appeared to me a specially heavy crop, and it has been mostly secured in splendid condition. I saw some very heavy pieces of Wheat, and both Oats and Barley are far better than those to be met with on this side of the Channel. Indeed, it was lamentable all the way between Dover and London, travelling through the richest districts of Kent, to contrast the miserable crops there growing with the abundance on the other side. It is satisfactory to know that north of the Humber agricultural prospects, even in our own country, are just as good as they are bad in the south, and unless a very wet hay and corn harvest follows there and the Potato disease spreads rapidly and injures the tubers, the Yorkshire, Lancashire, and Scotch farmers will have little to complain of, as they will have good crops of hay to sell at famine Very different is the prospect for agriculturists in the western, southern, and eastern districts of England, where hay, roots, and spring corn are all seriously deficient, and Wheat cannot be an average crop.

THE FIRST POCKETS OF HOPS.

THE first pocket of new Kent Hops arrived in the Borough on Monday last, and was sold at £25 per cwt. In sending this information, Messrs. W. H. & H. Le May state that the effect of the rain that has fallen during the last three weeks can now be seen. It has freshened up all, but the Golding Hops in Mid and East Kent have benefited the most. The bine is now full of sap, and the foliage a very dark green. With fine hot dry weather from now till picking they would estimate the Golding grounds to give a crop of 8 cwt. per acre. With regard to the Fuggles on the heavy clays of the Weald of Kent and Sussex, the rain came too late to increase the crop much. These Hops, with the earlies, such as Prolifics, Hobb's, and Seale's, may produce an average of 3 cwt. to 4 cwt. per acre, if the red spider that is running very fast through most grounds does not prevent the development of the Hop cones. Many experienced growers think there will not be a pocket per acre picked in those grounds that are badly infested with red spider. The market is very firm.

On Saturday Messrs. Edward Webb & Sons, Wordsley, received a pocket of new Worcester Hops, which passed the public scales at Worcester on Friday, which is the earliest date on record. It was grown by Mr. H. T. Taylor, Showle Court, Ledbury. The pocket was resold to Mr. W. Butler, Crown Brewery, Birmingham. The quality of the year's crop is likely to be good, but a light yield is expected.

REMARKS.

23rd.-Generally sunny in the morning and cloudy in the afternoon; rain after 6 P.M.

and heavy rain from 9 P.M. to 11 P.M.

24th.—Rainy till 6 A.M., and overcast till 11 A.M., bright and sunny after.

25th.—Generally sunny throughout the day; cloudy with spots of rain in the evening.

26th.—Bright early; showery with thunder from 8.30 A.M. to 10 A.M., then generally sunny till 3 P.M. and variable after, with frequent thunder and occasional rain

Fine and generally sunny, but occasionally overcast in the afternoon.

-Bright early, but very calm, and the sun became gradually obscured by the accumulation of smoke; cloudy in the afternoon and overcast with spots of rain

in the evening.
-Occasional sunshine in the morning, but generally overcast; rain at 0.30 P.M., and slight showers later.

Temperature very similar to that of the previous week and of the average. Very little rain except on the 23rd.—G. J. SYMONS.

HERE are various ways of spending Bank Holiday, and it will L be conceded that those persons who endeavour to combine pleasure with instruction on holiday occasions spend the time at their disposal not unwisely. When we remember the methods that were indulged in by the community during periods of recreation some half a century ago and compare them with those in vogue now, we cannot fail to recognise an advance in the right direction in the habits of the people. The change has been brought about in part by the better system of education that is now well established, and in part—and a very large part too—by the development of railways and the temptations of their managers to secure as large a share as possible of the loose cash of the million. Inducements to travel have been offered till they seem to have become irresistible, and cities and towns become perceptibly emptied by the exodus of their inhabitants. Some, it is true, indeed many thousands, stop short at the parks and commons that have been provided or preserved near populous centres, and this proves the value and usefulness of those large, enjoyable, and healthy places of popular resort. Thousands more go farther afield and have a veritable "day in the country" or at the seaside. Then efforts are being made in semi-rural districts to attract the people to some pleasant centre, such as a gentleman's park, where a flower show and an exhibition of cottage garden and allotment produce is held and modes of healthy enjoyment provided.

There is a greater disposition now than ever existed before to afford encouragement to the working population to derive pleasure and profit from small gardens and allotments, and, happily, greater alacrity on the part of workers to accept it. We read in a daily paper that the excellent institution known as the Finchley Allotment Holders' Society contrived on Monday last to combine business with pleasure, and it succeeded admirably. It took advantage of Bank Holiday to show what it could do in the cultivation of fruit, flowers, and vegetables. There are 345 allotment holders in the Seciety, and they contributed nearly 450 exhibits. The Finchley Society is an example of what may be done throughout the country. It is beyond question that the cultivators of allotments, small holdings, and cottage gardens may put into their own pockets a great amount of money that is now spent upon importations from abroad. Under a fully developed system the cultivation of allotments and small holdings would go far to arrest or counterbalance the decline which is observable in several branches of what is still the chief national industry. The existence of this Society of Allotment Holders at Finchley also reminds us that the English petty cultivator may profit by the example of his French neighbours. In a recent report, drawn up at the British Embassy in Paris and lately published by the Foreign Office, an interesting account is given of the unions which the small farmers of France have formed among themselves for the purpose of buying the best seeds, manures, and implements at the lowest prices, and of selling their surplus produce on the most favourable terms.

Another example of spending Bank Holiday on similar lines was afforded by the Show of the Beddington, Carshalton, and Wallington Horticultural Society that is established to promote interest and efficiency in cottage gardening and allotment culture in a district having an area of about four square miles. Mr. A. H. Smee, C.C., is a leader in this work, and takes active personal

interest in the welfare of the Society. At this last Bank Holiday Show he provided a class at once novel and useful, and which also proved an unqualified success. It may be fittingly termed a Sunday dinner class for a working man's family. The idea "caught on," and it is impossible to speak too highly of the results. It is not easy to conceive the effect of some thirty dinners arranged side by side, all giving evidence of thought, taste, and culinary skill. As the entries came in the question of judges became a matter of concern. It is thought that the views of high class experts, such as club chefs, might be different from those accustomed to dinners of this character. It was eventually decided that one of the County Council lecturers on cookery should, in conjunction with a gentleman who during many years had practical experience of a working gardener's fare, and who also well knows what is good in advanced cookery, award the prizes. Having regard to the novelty, excellence, and altogether satisfactory character of this dinner show, we asked Mr. Edward Luckhurst to describe the exhibits in the belief that his description would be of interest to the majority of our readers, and he obligingly complied as follows:-

"At the annual Show of the Society above mentioned, held at Carshalton Park on August Bank Holiday, a novel feature was introduced in the guise of a competition open to the wives and daughters of all subscribers and members for the best dinner to be produced at a cost not exceeding 2s; the dinner to consist of meat and at least two distinct kinds of vegetables, and be sufficient for a man, his wife, and three children, the value of each article to be clearly stated. This was proposed by A. H. Smee, Esq., who with his usual liberality gave £5 to be awarded in four prizes of £2, £1 10s., £1, and 10s., to which, owing to the hearty response made to this offer, and the evident utility of the competition, Mr. Smee added three other prizes of 7s. 6d. each.

"How popular this new departure is was shown by the thirtytwo entries, filling the central table of a large tent. So good were most of the dinners that the work of judging was anything but a light matter. To visitors the Show proved an irresistible attraction, the tent being thronged all the afternoon, and discussion ran high over the merits of the exhibits.

"As was to be expected this class showed praiseworthy traits of humble life and character. How much time, thought and care had been devoted to the work, how thoroughly the competitors had thrown themselves into it, and how eagerly results were looked forward to, could probably hardly be grasped by even such an appreciative throng as made access to the table most difficult. One point about which there was an unmistakeable concensus of opinion was that the best dinner gained the first prize; but "how Mrs. Stevens did it for the money" was evidently a puzzle. Mrs. Stevens is the thrifty wife of the worthy head gardener to E. G. Coles, Esq., The Lodge, Carshalton, who himself took high honours as first for a collection of vegetables, first for a collection of fruits, and several other leading prizes in the Show. Mrs. Stevens' dinner consisted of a well cooked joint of pressed beef, a tureen of soup made in cooking the beef, which was temptingly glazed and garnished with Beetroot and Parsley; two equally well cooked dishes of Runner Beans and Potatoes, a Plum tart, and custard with bread comprised the rest of this appetising meal, which was alike admirably selected, cooked, and placed on the table. The cost was precisely 2s. To go into details the prices given were soup flavouring 1d., beef 9d., Beet, Parsley and Glaze 11d., Beans 3d., Potatoes 2d., Bread 1d., Plum tart 4d., and custard 1½d. The whole of the judging was done by pointing; the points awarded to the first prize being 54, to the second 51 to the third prize 47, and to the fourth prize 46, showing plainly' how close the competition was. The maximum points allowed amounted to 98: soup 8, fish 8, stews 10, meat or puddings 10, vegetables 12, sweets 6, pastry 6, savory or cheese 6, bread 4, salad 4, sufficiency 6, cost 6, skill in preparation 12. It will be

understood that several of the points were provisional, and not touched at all. No two dinners were alike, and the main details are given in case they may be suggestive to others, as they may wish to add an interesting feature to cottage garden shows.

"Good management as well as good cooking had its due influence upon the Judges' decision, and Mrs. Stevens' admirable management certainly exemplified true economy, not only in the cooking and serving of the food, but in the purchase of it. Mr. Smee is to be congratulated upon his successful innovation, and upon the admirable illustration of domestic economy which this new feature in exhibiting affords."

Another special feature set forth in the schedule was for a collection of vegetables in nine distinct kinds, which were to include a selection from the following:—Nine tubers of Potatoes, three Cauliflowers, nine Onions, thirty-six pods of Peas, twentyfour pods of Broad Beans, six Carrots, three Marrows, fifty Kidney Beans, three Cabbages, six Parsnips, and six Turnips, Parsley being admissible for furnishing. This class was rendered the more interesting by the fact that it was open to all amateurs, cottagers, and professional gardeners in the district. The competition was remarkably keen, and the work of the Judges thus rendered unusually difficult. The maximum number of points which could be gained was 73, and the winner of the first prize, Mr. J. H. Stevens, was adjudged $54\frac{1}{2}$, or $18\frac{1}{2}$ below the maximum, which, considering the season, was very good. It will doubtless be interesting to readers to know with what produce Mr. Stevens gained his position, and the number of points he was awarded for each kind, and a list is appended. Potatoes 6 (out of 10), Peas 6, Scarlet Runner Beans 5, Cooking Cabbages 6, Cauliflowers 7½, Onions 6, Turnips 6, Carrots 7, Parsnips 5 (the standard of all these being 8 points) which gives an aggregate of $54\frac{1}{2}$. We have said the competition was keen. Mr. J. Slater, who was awarded the second prize, reached 54 points; Mr. Wm. Newton third, 53, and Mr. Hy. Schoolbridge fourth, $51\frac{1}{2}$. It was a popular class, and gardeners won all the prizes but the third. Mr. Newton was a working builder last year but is developing into something else. After hearing lectures on horticulture he commenced the erection of glass structures. They were completed this spring, and during the present summer he has grown and sold 12,000 Cucumbers and 2 tons of Tomatoes. He is further "making land pay," not under glass though it costs him £8 an acre in rent and taxes. The improvement in garden and allotment culture in the district is remarkable, a comparison with the pointing of every crop on plots in competition for prizes last year and this showing an average increase of 40 per cent. during the present season of drought, as ascertained by Mr. Smee. This is the most effectual, practical and conclusive test of cultural knowledge—appraising the crops for prizes, and not 1 per cent. of the men who learn the most and work the best could be induced to sit for examination in a room and attempt answering a series of questions on paper.

In connection with the Show under notice, at which some 300 prizes were awarded, including a silver medal to Mr. G. W. Cummins, a Conference on gardening was held. E. J. Halsey, Esq., Chairman of the Surrey County Council, presided, and in an admirable speech promised that all possible help and encouragement should be afforded to those workers who wished to improve their position by their own efforts, and gain something in addition to their wages, in order that they might feel themselves more independent and happier in their homes. Mr. J. Wright also gave an address with "object lessons," showing the effects of right and wrong methods in the production of vegetables, fruit, and flowers. The tent would not hold half the people. The sides were removed, and the packed audience, inside and out, manifested the closest interest in the proceedings. Pleasure was undoubtedly combined with instruction in the spending of Bank Holiday in Carshalton Park, and doubtless many other places in the kingdom on that bright and beautiful day.

PEACH-GROWING FOR MARKET.

ROUND London there appears to be a tendency for market growers to confine their attention to the cultivation of one or at the most two kinds of fruit or "fruit vegetables." Some grow nothing but Cucumbers, others Cucumbers and Tomatoes, a few grow Grapes and Tomatoes on a very large scale, and instances have also come under my notice of Peaches and Nectarines being the fruit principally grown. Undoubtedly it is a great mistake to attempt the cultivation of a variety of crops, especially if it ends in none of them being done well, and beginners in the neighbourhood of the Metropolis ought certainly to be warned in time. The case, however, with market growers starting in the provinces is different and greater variety is called for. According to my experience, provincial towns are far from being well supplied with Peaches and Nectarines. There seems to be a good demand for all but the very earliest fruit. Last June the prices obtained for good average fruit from a provincial fruiterer was 25 per cent. better than that allowed by a leading salesman in Covent Garden, and judging from the published returns the improvement has been well sustained. On June 19th a consignment of six dozen selected Peaches realised £3 12s. after carriage was paid, commission not being charged, and that I think very good for a country town. This year Peaches and Nectarines were in greater demand than usual during the latter part of June and the first fortnight in July (owing to the scarcity of high-class Strawberries), telegrams for more to be sent on being frequent. I like telegrams to be flying about, as that means a brisk trade and good prices.

On page 515, last volume, I briefly alluded to a class of 14 feet wide span-roofed houses that answered well for Tomatoes and Chrysanthemums. Such houses are very suitable for Peach and Large quantities of fruit are not desired Nectarine culture. at one time, and a succession is obtained by growing early and late varieties in one house. For instance, I commenced gathering Early Alexander during the first week in May, Hale's Early, A Bec, Crimson Galande, Bellegarde, Dymond, Barrington, Sea Eagle, and Walburton Admirable forming a good natural succession, the two last-named not yet being marketed. Good sized highly coloured fruits are most in demand. Waterloo and Early Alexander, both very showy varieties, with very little to choose between them, are the best early Peaches, but, unfortunately, addicted to bud dropping. Hale's Early, also of American origin, is from a week to ten days later, but far more reliable, while the fruits are large and well coloured. All three are bad travellers and keepers, and must certainly be marketed before they are fully ripe. A Bec is a really good second early variety; fruits large, of good colour if properly exposed, and fairly firm when ripe; quality first-rate. In Crimson Galande we have the beau ideal market Peach. It is of free, yet very productive, habit of growth, a sure setter, and the fruits, without being greatly exposed, colour grandly. Perhaps the best midseason market Peach, and good also for private gardens. Barrington should be included by growers who wish to keep up a long succession. The tree is a healthy grower, and good bearer of fairly large and well-coloured fruits which travel and keep well. Princess of Wales, unfortunately, does not colour well, otherwise it is a fine easily grown Peach. Sea Eagle possesses a fine constitution, sets freely, and the fruits, if properly thinned, attain an extra large size, colouring grandly, and keeping longer than most varieties. I have frequently obtained 18s. per dozen for good samples of Sea Eagle in August, and, all things considered, this is one of the very best that a market grower can cultivate, either under glass or in the open air. Walburton Admirable ripens still later and attains a large size, but cannot be depended upon to colour well. It may not have occurred to many market growers to give Salwey a trial, but this "turnipy" Peach sometimes pays remarkably well. I have known instances of 30s. per dozen being given for fruits from an open wall, but they were sold during the first fortnight in November. In an unheated house this variety can sometimes be kept till November, and medium-sized, highly coloured fruit will fetch not less than 18s. per dozen in Covent Garden Market. Salwey is a sure bearer, but not much must be said in favour of its eating qualities.

Nectarines do not pay so well as Peaches, and in addition are not so easily grown. Being smooth skinned the fruits are more liable to be disfigured by insect pests and scorching. There is a demand for them, but nothing like that for Peaches, and I find one tree of Nectarines to four of Peaches a fair proportion for market culture. As a rule Nectarines are not large enough to please buyers, and if colour is lacking the prices will fall accordingly. The new Early Rivers promises to meet a long-felt want—viz., a Nectarine that will ripen at much the same time as the earliest Peaches under similar treatment. It is also a fine variety and colours as well, if not better, than Lord Napier. The latter was

hitherto the best early Nectarine, and till Early Rivers can be had in quantity should be planted the most freely. I have never obtained more than 9s. per dozen for Lord Napier, the prices gradually coming down 4s. per dozen for fairly good samples. I do not advise market growers to plant the richly flavoured Pineapple and Pitmaston Orange, but they may grow Stanwick Elruge to succeed Lord Napier, this being an easily grown, heavy-cropping, highly coloured variety. Hardwicke is also large and free-bearing and colours well, being better for market purposes than the much better known Elruge from which it was raised. If a late variety is desired plant Victoria. The variety is a great cropper, rendering free thinning necessary, and the fruits must be well exposed to increase their size and develop the best colour.—Market Grower.

(To be continued.)

HARDY FLOWER NOTES.

In a season such as this has been, we feel inclined to withdraw the unkindly expressions which, openly and mentally, we have applied to our British climate. The brief period of drought we have had here (near Dumfries), and which has left its mark in slight degree, has been broken, and welcome rain has given refreshment to gardens and gardeners alike. As we wander into the garden to work among its inmates or to study afresh the beauty of their forms and hues, they seem to stand "smiling by" with a blithe welcome for their admiring owner, who has in these bright blooms a reward for much forethought and care. The matchless Rose, the wax-like Lily (which will perhaps forgive the comparison of the texture of its petals to the work of the bee); and many others, stately and lowly, join in this welcome, and he is indeed callous whose heart does not respond with joy to their

greeting.

These flowers of summer are so numerous and so beautiful that selection is always invidious and generally unsatisfactory; but the many Meadow Sweets or Spiræas, some past and some at the time of writing still in flower, by their feathery beauty have pressing claims for notice, as they rise above other border plants, or form neat tufts covered with their graceful flowers. Among these Meadow Sweets or Dropworts there is none more graceful that the noble Spiræa Aruncus, the Goat's Beard, with its fine panicle of plume-like flowers. Even more graceful, and in some positions more desirable on account of its dwarfer habit, is S. astilboides, the Astilbe-like Meadow Sweet, a native of Japan, which is rapidly becoming popular both for border and forcing A newer variety, known as S. astilboides floribunda, I have not met with, but if superior to the type it will certainly be an invaluable plant. I have at present in the room in which I write a plant of the typical species in full flower which was lifted and potted, not being forced in any way. The only fault it possesses for the house is that its fragrance is towards evening rather overpowering. There is a great wealth of material among the Meadow Sweets, and they are worthy of more extended cultivation in their various forms, herbaceous and shrubby, and in their various colours; although, personally, I prefer the white and creamy shades to the pink or red colours of some.

The various Thistle-like plants of our gardens are always appreciated by all who see them. The Eryngiums, with their steel-blue or ivory heads and stems, are justly becoming increasingly popular, and this favour is also being extended to the various Echinops or Globe Thistles. A fine plant of E. commutatus, the Changeable Globe Thistle, has attracted much attention here.

Tusser tell us that—

"If Thistles so growing prove lusty and long, It signifieth land to be hearty and strong."

If we are to take that old writer to be an infallible authority my garden must be of soil "hearty and strong." The contrary is, however, the case, and I have little doubt that the height of 7 feet which E. commutatus has attained here is due to the plant being a seedling and thus full of vigour. The Changeable Globe Thistle is a native of Austria and other parts of Europe, and was introduced in 1817. It is classed as a perennial, but many of the Echinops in our gardens are either not true perennials or are short-lived, and it is well to have a young plant in store to replace a lost one. Very stately is, as may be supposed, this fine plant, with its spiny pinnatifid leaves, rough above and downy beneath, and its round, whitish balls of flower.

In sharp contrast to the stateliness and rugged beauty of the Echinops is the grace and elegance of the Feather Grass (Stipa pennata), which has for a time been in full beauty. Here is no glittering beauty, no Pæony-like bloom of striking colour, no massive grandeur, but instead a plant of tenderest grace. Little wonder was it that in olden times, as Gerard tells us, ladies wore

the plumes of this Grass as feathers, and, if we no longer see it thus in use, its elegance commends it as a garden plant. Even before it flowers the tussock of arching grass is very beautiful, and when the blooms appear, and while they last, they are full of attraction, moving as they do with the lightest breath of air. When winds are fierce they toss and pirouette, when softer gales are blowing they float lightly to and fro, and when hardly a breath is to be felt they move gently with the slightest current, their gossamer-like lightness making them the sport of the lightest breathings. We want graceful as well as showy plants in our gardens, and these hardy Grasses are not nearly enough grown.

Not the least pleasant time in the garden is the evening, when some flowers seem to shine with a softer and gentler beauty. It is true that some have closed their petals, desiring not the cool dew, or seeking to screen themselves from the flying moths in search of food. It is also true that then the sun no longer shines through the petals of the Poppy, giving it the appearance of some piece of stained glass taken from some cathedral where the glass stainer's art is shown in perfection; but, on the other hand, some flowers, such as the Evening Primroses, which look dowdy in the sunlight, come into beauty as the shades of evening creep along. Then it is that the white or golden cups of the Enotheras seem beautiful. As Bernard Barton says—

"I love at such an hour to mark
Their beauty greet the night breeze chill."

And such flowers as these may give much delight to those whom business calls from home by day, and whose evenings in the garden might be made more enjoyable by the beauty of the delightful Œ. marginata, with its white cups; of the pretty Œ. taraxacifolia, with its Dandelion-like leaves and white flowers changing to crimson; or even by the more common Œ. biennis, no mean plant, with stately habit and soft golden flowers. Those, too, who can enjoy their gardens by day need not confine themselves to the night-blooming species, but will find in Œ. Youngi and Œ. Fraseri

two plants which will give much pleasure.

One of the charms of the garden of hardy flowers is its cosmopolitan character. Here some native plant grows side by side with one from the steppes of Siberia; there a Greek Crocus reposes under a carpet of Spanish Stonecrop; here, again, a plant from the Himalayas is cheek by jowl with one from the South American We read much of triple alliances, but the garden would almost exhaust the vocabulary to describe the characters and multiplicity of its friendly leagues. I fancy, however, that most of us must confess that we may have some "respect of persons" or plants-in our likings, and that we may have a preference for flowers from some particular portion of this globe of ours. I, for one, must confess to a desire to possess more of the flowers which, in the newer Britain of the Antipodes, for long displayed to the Maori the charms of Nature, and now give the colonist some compensation for those he left behind. Thus it is that the New Zealand Veronicas are specially attractive to me, and glad am I that their real beauty only enhances their attractions. them are quite hardy on rockwork here, and, although well known, yet worthy of repeated notice is V. Traversi, which in good soil will form great bushes of evergreen glossy foliage, clothed in summer with countless spikes of pretty white flowers with purple anthers. Beautiful as it is thus, the prettiest plant I have ever seen is one on the top of a dryish rockery here, where it is somewhat stunted in growth, with the effect of increasing the quantity of flowers and its neatness of habit. It has been very beautiful, forming a bush only 18 inches in height and $2\frac{1}{2}$ feet across, and coming into flower before an "Alpine Rose" (Rhododendron ferrugineum), which is close to it, had passed out of flower. The two formed a pleasing picture. Very fine, too, has been V. speciosa, with its beautiful glossy leaves and its spikes of purple blue. This is on the top of a rockery, but protected by a wall from the north wind—a needful precaution for this species, which is not nearly so hardy as Travers's Veronica. Others, such as the curious V. salicornioides, V. Colensoi glauca, or V. Lyalli, are grown here, and I hope gradually to add to my collection of hardy sorts. Thus on border or rockery does summer yield her floral charms-rich in beauty, grandeur, grace, or in tenderest associations, and all things that endear them to our hearts.—S. ARNOTT.

SCARLET RUNNER BEANS NOT SETTING.

THE failure of Scarlet Runners to produce pods has been attracting my notice for some time, and I have read all that your correspondents have written on page 106, about which I offer the following criticisms. There does not appear to be anything abnormal about the form of the flower this year. The double coil at the point of the keel is quite usual, so is the sheath, within

which anthers and stigma are contained, the point of the stigma protruding slightly, and being pushed out more on the slightest pressure from above, the anthers remaining just visible at the mouth of the opening. Whether pollen is unusually deficient I cannot say. The flowers can hardly be fertilised by bees, as it is their habit in visiting these flowers to puncture the lower side of the calyx, if not already done; and I observe that they proceed at once to this aperture as if by instinct. Neither hive bees nor humble bees nor wasps are below the average in quantity this year. All of these visit the flowers, and all extract the honey in the same way; I believe they do so every year. I know several other flowers which they invariably treat so. My gardener believed that the unusual abundance of these insects, and their habit of licerating the base of the calyx, and so damaging the attachment of the embryo pod, was the cause of failure; but I do not agree to this. I tried brushing a quantity of marked flowers with a camel-hair pencil, and my gardener tied up in muslin a quantity more whilst still in bud, but the result did not answer our expectation. About the same proportion, and no more (say 10 per cent.), set pods. Those within the muslin may have been self-fertilised but I find in nearly all the flowers within the sheath of the keel thrips, small coleoptera, and mites sufficient to fertilise them. The Scarlet Runners in my garden have at no time of their growth suffered from drought, and are more luxuriant than usual. I think in this fact we may perhaps have a clue to the cause of failure. It is generally believed that too luxuriant growth is a cause of sterility both in the animal and vegetable creation. Virgil warns farmers against it, both as regards corn and live stock; and the only point on which all your correspondents agree is that the appearance of the plants this year is unusually healthy and luxuriant.—C. Wolley Dod, Edge Hall, Malpas.

P.S.—On dissecting the flowers and examining them with a quarter-inch lens I find that they abound with thrips and red spider. These pests, which have been everywhere abundant through the spring and summer, find a comfortable home within the twisted sheath of the keel which encloses the vital organs of the flower. They worry and render abortive those parts, and are perhaps a more probable cause of the failure complained of than the luxuriance of growth as suggested above. The prevalent wet weather will probably lessen the plague, and we shall get more beans.—C. W. D.

I BEG to correct one word in the latter portion of my note in last week's issue, page 106. It runs thus, "The disturbance of the reproductive organs is the cause of failure." For "disturbance" read non-disturbance of the pollen grains; nor is it either distributed by insects from flower to flower to ensure the desired Whilst jotting this correction I came across some of Professor H. Müller's observation on the fertilisation of Phaseolus coccineus, Lam.). He says, the hive bee and other small bees which are unable to press the carina down obtain the honey by taking advantage of holes which a humble bee (I suppose Bombus terrestris, L.) bites through the calyx. More powerful bees, with sufficiently long proboscides, alight on the left ala, and in forcing the proboscis down into the flower bring its base in contact with the stigma. Now, when the ala and the carina (which is united to them) are further depressed, there emerges from the tubular apex of the carina, which is coiled nearly into two complete whorls, the similarly coiled style, and it emerges in such a way that its stigma points downwards and towards the left, and its pollen covered hairs come in contact with the base of the insect's proboscis, dusting it with fresh pollen. In this manner crossfertilisation is insured, and self-fertilisation prevented in case of insect visits. In absence of insects self-fertilisation cannot occur, insect visits. since the stigma protrudes from the carina, while the pollen is enclosed within it.

The similar mode of fertilisation in the Kidney Bean (Phaseolus vulgaris, L.) was described ten years earlier by Darwin, who showed by experiment that insect visits are essential for the fertilisation of this plant. Plants covered with fine net remained completely barren, unless the action of bees were artificially imitated. When Darwin repeated the experiment on a larger scale a few flowers on some specimens bore fruit. Small insects (thrips) had presumably gained access to these. Dr. Ogle also gives a description of the floral mechanism in P. vulgaris (French Bean), and P. coccinea (Scarlet Runner). Of the flowers which Dr. Ogle protected from bees by means of a gauze net no single one bore fruit.— J. D., Duffryn, S. Wales.

THE FERTILISATION OF RUNNER BEAN FLOWERS.

Whilst I generally agree with Mr. Abbey in his conclusions as to the non-uses of insects in relation to the fertilisation of Bean flowers, I differ from him entirely in his assertion that the

Scarlet Runner is, after all, not derived from Phaseolus multiflorus, but from Phaseolus vulgaris, the Dwarf or French Bean. That the old Case Knife, the Butter, and the climbing white or pale flowered section of the French, are come from Phaseolus vulgaris can hardly be doubted, but the scarlet and white Dutch Runner section is absolutely different in every respect; the plants never assume a dwarf form, and always have fleshy or tuberous roots, which practically make them perennial. But the question opened up under the above heading has wider range than is found in its present limitations. The matter applies to all flowers, more or less to the question as to how far insect agency is absolutely essential to pollenation or floral fertility, or how far, on the other hand, Nature performs her functions in flowers without external aid. We have here, whether it be limited to the consideration of the fertilisation of Runner Bean flowers only, or to the wider one of the actual necessity for insect agency in relation to flowers generally, a subject into which the Scientific Committee of the Royal Horticultural Society may well dip with perhaps much greater advantage to horticulture than is at present made evident from the deliberations of that distinguished body.

I do not think that insect agency is absolutely essential to the fertilisation of Bean flowers, because I think the actual pollenation has taken place before the flowers are expanded. It is certainly the case with Peas, and I think it is the case with most pod-bearing plants. Anyone who dissects a Bean flower will find that it is practically impossible for a bee or other similar insect to assist pollenation in any way, and as the bees, if carefully watched, are found to avoid all partially expanded blooms, and to operate on those fully open, the inference is that they are too late to assist in fertilisation.

Looking over literally hundreds of allotments in different parts of Surrey in almost every one of which Runner Beans were growing well, I invariably found a fine well set crop. This I attributed to the cooler atmosphere and active air found in open fields as compared with what is found in hot enclosed gardens. Great heat, and especially a dry temperature, may be, indeed I think must be, productive of barrenness, and especially so when aided by drought at the roots. Thus we invariably find that the earliest flowers on Runner Beans set well, also the later ones when the temperature is lower, indeed the flowers never set so freely as towards the end of August and early in September. It is during exceptional hot dry weather that barrenness results; but the trouble is all over now and there is a plentiful setting going on. I find this to be the case in a very hot dry town yard with my Runner Beans.—A. Dean.

HARDY PERENNIALS FOR CUTTING.

No garden can be considered complete without a serviceable border of hardy perennials for cutting. Although there is never at any time a general display, except, perhaps, when Squills, Narcissi, and other spring-flowering bulbs are in bloom, something of interest may be had continuously, and by judicious selection it is possible to have at all times a good supply of cut flowers. Flowers in early spring are especially appreciated, since considerable time must elapse before a general display of summer-blooming annuals, like Sweet Peas, Stocks, Poppies, and Asters may be had. New or rare kinds are not always satisfactory to the amateur, but there are many of free and easy growth which can be thoroughly recommended.

Lenten Roses, mostly hybrids or forms of Helleborus orientalis, are among the earliest flowers. These are bowl-shaped, white, sometimes shaded with green or reddish purple, and often beautifully spotted. They are borne on leafy stems, and are very serviceable flowers to cut, keeping well for a long time. The best time to plant or to divide the clumps is in the autumn. Some of the best hybrids are Frau Irene Heinemann, Hofgarten Inspector Hartweg, and Willby Schmidt. The Christmas Rose (H. niger) blooms in southern and eastern Europe during the winter, and imported roots are frequently offered in America. It would be well to note here that it is not a very satisfactory hardy plant, at least in the New England States. Being disposed to bloom on the occurrence of a mild spell, it is sure to be cut down by the succeeding sharp frosts. Spring frosts usually injure the young leaves, and consequently it is rarely in a very thrifty condition in that part of America.

The numerous species and varieties of Narcissus furnish some of the most beautiful spring flowers useful for cutting. While many of the newer and rarer garden hybrids are costly, there are common kinds in abundance which may be had cheaply enough to be within the reach of all, and it may be taken as an axiom that the cheaper they are the more satisfactory they will be. The common English Daffodil and its varieties are probably better

known than any, and are seen in florists' windows from January until Easter-time, having been forced in greenhouses. The flowers are large, trumpet shaped, borne singly on stout stems, wholly yellow in such varieties as Golden Spur and Trumpet Major, and with a white perianth and yellow trumpet in Horsfieldi, and a primrose trumpet with yellow perianth in Obvallaris, the Tenby Daffodil. The Incomparabilis and varieties follow the trumpet section in their period of blooming, and are distinguished by a larger perianth and smaller trumpet, which is in these called the crown. Of this class the great Welsh Chalice Flower, Sir Watkin, is the best. It has a vigorous constitution, and increases quite rapidly. The Poets' Narcissus is the latest of all to bloom. flowers are white, with a small crown edged with red. It is, moreover, very sweetly scented.

Doronicum plantagineum excelsum is a very handsome early yellow blooming Composite. It makes an excellent border plant, and furnishes a good supply of flowers for cutting. The Virginian Cowslip (Mertensia virginica), with its lovely panicles of metallicblue flowers, is ever welcome; the cut flowers are charming. should always be planted where it can have especial care. It forms long tuberous roots; dying down very early in the season it is apt to be overlooked and destroyed by hoeing. The common English Primrose and the more recent Primrose-Polyanthus hybrids have developed a beautiful class of plants for early spring border work, as well as for general house decoration. There are now strains producing flowers of all shades of red, purple, lilac, yellow and white. Heuchera sanguinea is a comparatively new and beautiful species from Mexico. It is suitable for the front rank of the border or for the alpine garden. Its long, slender spikes of coral-red flowers are particularly beautiful, and last for a long time. Sweet Williams (Dianthus barbatus), although rather unwieldy for cutting, have the affectionate regard of all flower lovers. They are best cultivated as biennials. Seeds may be sown in May, and, transplanted 8 inches apart, they make good clumps for shifting into blooming quarters in the spring following. Day Lilies (Hemerocallis) are among the most satisfactory border plants. The flowers are of various shades of yellow. By taking H. Dumortieri, orange yellow, early; H. graminea, sulphur yellow, early; H. flava, yellow, summer blooming; and H. Thunbergi, sulphur yellow, late, a supply of these may be had for a long time. The flowers are sweet-scented, and are effective for decorative work.

Pæonies generally suggest, in the popular mind, very showy but rather coarse double flowers. The single varieties are exceedingly handsome and very appropriate for vases. The Maltese Cross, or Scarlet Lychnis (L. chalcedonica), is a very common border plant, very bright and pure in colour. In this respect it is unique. No plant gives so much satisfaction, taking care of itself perfectly; it remains more or less in bloom during the entire summer. L. vespertina plena is the double form of the common evening scented species of Europe. While healthy enough where established, it is safer to protect its rather fleshy rootstock with a few dry leaves. The Alpine Poppy (Papaver alpinum) and the Iceland Poppy (P. nudicaule) are more or less in bloom the whole season, and if picked when freshly opened will last two or three days. colours of the first-named are mostly shades of red and white, of the latter yellow. In habit and constitution they are very much alike. These elegant little species are not quite happy in an ordinary border; they should have a space set apart, free from the shade of coarse growing plants, and also have the slight protection of leaves or Pine needles rather than manure. Perennial Larkspurs are noble border plants. Their majestic spikes of blue stand out distinctly. The double varieties are desirable for cutting, lasting well. By a little care in cutting away seed stems a supply may be had until late in the autumn. The double white Achillea Ptarmica, although rather weedy in habit, is a free bloomer and quite indispensable where cut flowers are required.

Coreopsis grandiflora is a clear yellow flowering species, giving an abundance of blooms until late. It is rather biennial in character, but sows itself so freely that there is never any danger of losing it. The double as well as single varieties of Pyrethrum roseum and Potentilla grandiflora are general favourites in European gardens, where many fine named varieties are cultivated. These should be grown in beds or borders by themselves and receive abundance of water in summer and light protection in winter. Thermopsis caroliniana, a yellow-flowered member of the Pea family, makes a bright and attractive border plant. Its handsome spikes of yellow flowers are useful in vases. Many other perennials might be added, but Helianthus decapetalus, single and double, Aster bessarabicus, A. Novæ-Angliæ, and the Japanese Anemones must close this list of useful plants, and these will furnish flowers from spring until autumn.—T. D. H. (in Garden and Forest).

BULBOPHYLLUM VIRIDE.

This small species was sent to Kew for determination by Philip Crowley, Esq., Waddon House, Croydon, in December, 1890. A plant presented to the Kew collection has since flowered on two or three occasions. It is allied, says the "Kew Bulletin," to B. intertextum, Lindl., from the same region. The flowers are wholly light green, except for the presence of a pair of small dull purple eye-like spots on the base of the lip, and a stain of the same colour on the face of the column.

ERIA ALBIFLORA.

This plant was sent to Mr. J. O'Brien of Harrow-on-the-Hill, Middlesex, with whom it flowered in June, 1891, and again in August of the following year; and it has also flowered at Kew. It belongs, the "Kew Bulletin" observes, to the section Bryobium, and may be placed next to E. articulata, Lindl. The flowers are white, and are borne in a lax raceme on a slender scape. There is a drawing in the collection marked "Wynaad, Sept., Jerdon's sale, 1873," which is evidently the same species, but it does not appear to have been previously described.

CŒLOGYNE TENUIS.

This species belongs to Lindley's section Flexuosæ, and, according to the July number of the "Kew Bulletin," may be placed next to C. borneensis, Rolfe (supra p. 62). It differs in its one-leaved pseudo-bulbs, slender scapes, and other characters. It was introduced by Messrs. Linden of L'Horticulture Internationale, Brussels, with whom it flowered in August, 1892. The flowers were somewhat without when received but appear to be of a light were somewhat withered when received, but appear to be of a light buff shade, with very few markings on the lip. The pseudo-bulbs. and leaves are described from a reduced sketch.

Masdevallia Gelengiana.

When exhibited by Sir Trevor Lawrence, Bart., at the meeting of the Royal Horticultural Society, on April 25th of this year, a

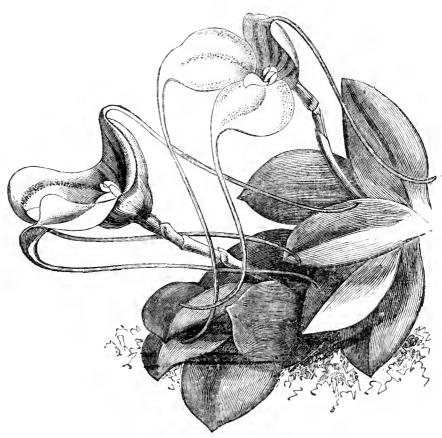

FIG. 18.—MASDEVELLIA GELENGIANA.

plant of Masdevallia Gelengiana created some interest amongst orchidists, and a first-class certificate was awarded for it. As shown in the engraving (fig. 18), the plant is dwarf in growth, being less than 4 inches in height. The flowers are not very large, and are pale greenish yellow tinge, covered with minute rosy crimson spots. The tail-like appendages to the blooms are about 3 inches in length.

EPIDENDRUM PUMILUM.

A pretty little species allied to E. Endresi, Rchb. f. (apparently the nearest ally which has yet appeared, but very different in the shape of its leaves and colour of its flowers. It was imported by Messrs. F. Sander & Co. of St. Albans, with whom it flowered in January, 1890. Early in the present year it was also received for determination from Mr. F. W. Moore, Glasnevin Botanic Garden. The sepals and petals are light greenish yellow, also the lip, with the exception of the orange-yellow callus. The column is very pale green below, nearly white above. As in E. Endresi, the sheaths of the leaves are covered with small brown warts.

THE VIOLA.

This beautiful flower, the culture of which has of late years received a remarkable stimulus from the writings of Mr. Dean of Birmingham, Mr. Cuthbertson of Rothesay, Mr. McLeod of Chingford, and others, may perhaps be accounted by many of my readers, who do not know its value, a minor consideration when compared with other and more ambitious flowers, and yet it is possible that the Viola may have attributes of the greatest importance which they do not possess. not the glowing splendour of the imperial Lily or the queenly Rose, yet in its own exquisite department of Nature it reigns supreme. The period during which it graces our gardens is considerably longer than that which is glorified by any other flower. It blooms upon the grave of the Snowdrop and Hepatica; it is a charming contemporary of the vernal Daffodil; it sees the Aquilegia, after a brief yet delightful term of beauty, consigned to decay; it is not unnoticed in its unobtrusive sweetness, when the Musk Carnations break and swell. Of all of these floral magnates it is the lowly companion, and it survives them all. I hope my enthusiasm has not carried me away, but in the special direction of durability can as much be asserted of any other flower? Hybrid Perpetuals and Tea-scented Roses have two seasons, but each of these is sufficiently short in duration, and on the whole I greatly commiscrate those writers who can write only on the Rose, that most evaneseent of flowers. I have Roses such as the Reynolds Hole, which, though immensely eulogised by rosarians, can stand effectually neither sunlight nor rain. The former, if ordinarily powerful, annihilates their complexion; after a single shower of the latter, by which the Viola is greatly revived, they are found in a condition of putridity—a saddening revelation, which during the last extraordinary summer, and especially within the last three weeks, has often come to me. The flowers which, in my experience, most heroically withstand and survive the elements I have indicated are the Sweet Pea, the Aquilegia, the Lily, the Viola, and the Tropæolum. I have no desire, while thus emphasising the durability of our humbler garden treasures, to under-estimate thereby the value of the Rose. It is indeed, when perfect, a work of indescribed the control of the control o able beauty, but its glory is like that of the rainbow or the sunsct—it is marvellously short lived. It was Montgomery, that florist among poets, who sang:

"The Rose is but a summer's reign;
The Daisy never dies."

Almost as much might expressively be said of the Viola, for there are few indeed of the "Daughters of the Year" to whom its aspect is unknown.

I presume that every successful cultivator of this charming flower has his special favourites, and I am free to confess that my own are Violetta, a lovely miniature rayless Viola, with the fragrance of the sweet-scented Violet; the Countess of Wharncliffe, which is white sating alike to the vision and to the touch, perhaps the most cherished of my floral possessions; Bridesmaid, the White Duchess, H. M. Stanley, the Lemon Queen, the Countess of Kintore, and the uniquely complexioned Duchess of Fife. I have no desire to dogmatise upon so delicate a theme; I know there are no confines to the vast domains of taste, that prejudice is often so mysterious in its origin as to be perfectly unaccountable, save upon the principle of the law of variation; yet of this I am assured, that by reason of their faultless form and delicate perfume the varieties I have cnumerated should be included in every collection that is worthy of the name. I have little doubt that such veritable gems as Violetta and the Countess of Wharncliffe find favour with that veteran midland cultivator Mr. Wm. Dean, who has probably done more than any living man to raise the Viola into that eminence of popularity which, through his powerful exertions and its own inherent virtues, it presently commands

I have spoken of its manifold invaluable characteristics; I leave it to the specialists whose names I have recorded to describe its cultivation. -DAVID R. WILLIAMSON.

MIGNONETTE.

In the onward march of flowers towards perfection Mignonette has not been forgotten. not been forgotten. Many improved forms have been raised, but it would be too much to affirm that the ordinary cultivator has given to these the justice they deserve. Therefore, before I write a word of praise about the improved sorts, I shall draw attention to the negligent way in which Mignonette is cultivated. The ordinary grower commences wrong in sowing the seed much too thickly. The result is thin stems, small foliage, and poor heads of flower, with a short season of blooming. The truth is this sweet flower yields a return for the slightest amount of Many improved forms have been raised, but it

care devoted to it, consequently it has been culturally greatly neglected. I have some growing in a bed of Narcissi the ground being hard through want of digging, yet these plants are producing large spikes of bloom.

Mignonette succeeds well on dry soil. We have a long border which is always dry, unless when rain is falling, and Mignonette thrives well in this border; but it revels in a light rich open soil. In this, if given room, it grows and spreads with great rapidity. The plants should be at least 18 inches asunder, unless in the case of a dwarf sort, such as Tom Thumb which may be grown at a foot apart. Another point of importance is to see that no seeds are allowed to form and remain on the plants. Personally, I have no difficulty in this direction, as the plants are cut so hard and so often for their flowers; but where the flowers are not required it is worth while to remove all those spikes which get to the seeding stage.

For many years past we have had a choice of good varieties, and that being so, it is as well to grow these. Those I am this year growing are Cloth of Gold, Machet, Garraway's White, Crimson King, Tom Thumb, and Queen Victoria. All these are worth growing, a good selection being the three first named.—B.

CANKER IN FRUIT TREES.

In reply to "H. P." (page 105) I have the pleasure to say that the fungus I intended and referred to as producing scaly canker on Pear trees was as stated—Cladosporium dendriticum, Wallr., var. pyrinum. Actinonema cratægi is merely a form of C. dendriticum, which it is not usual to refer to when treating generally of the species. Besides, I was under the impression that the variety of the species found on Cratægus, especially the leaves of C. Pyracantha, was C. dendriticum orbiculatum. It is so given by the Rev. M. J. Berkeley in his "Outlines of British Fungology," and differs from the species as found on Apple trees, also from that found on Pear trees.

Dothiora pyrenophora, Fr., belongs, as "H. P." is no doubt aware, to the order Sphæronemei, and produces another form of canker on twigs of Apple and Pear. Another species, D. sphæroides, Fr., does the same on Ash twigs, and of both the fungus causing canker in its most malignant form—viz., Nectria ditissima—is not slow to avail itself.

Cladosporium dendriticum belongs to the order Dematiei, in which

the threads are free, rarely collected into stipitiform bundles, yet corticated and carbonised as also frequently are the spores. These in Cladosporium spring from the sides or terminally, and are short at first, finally uniseptate. Does "H. P." mean to imply that Dothiora pyreno-

phora and Cladosporium dendriticum are synonymous? D. pyrenophora spores are pedicellate, obovate, and simple.

Allow me to thank "H. P." for his interesting and (to me) instructive communication, and to say that I have not found Nectria ditissima on the roots of Apple trees, but the fungus has been found on those of Ash trees, which, however, are often exposed. The worst form of root canker (so called) that I have acquaintance with is that produced by American blight on Apple trees, and there is an allied species which infests the roots of Beech trees, and renders the stems almost white in some cases. Can any correspondent give the correct name and history of this species? I have an impression that it attacks the Crab, and if so it will attack Apple trees. If it be the same species that infests Crabs, as that which is found on Beech tree roots, it would make sad havoc in an orchard if once established in the trees. Perhaps "Entomologist" will enlighten us upon this point.

In making researches into the diseases of Larch which died off by the hundred acres when nearly large enough for pit props, for which purpose the Larch was grown, I found a number of fungi on the roots. These, however, were mostly stages of Agaricus melleus, namely Rhizomorpha fragilis and R. subcorticalis, the mycelium of which lives between the wood and the bark, and this species may occasionally be found on Apple-tree roots. The mischief to the Larch had manifestly been caused by Peziza Willkommi or calycina, which acts much in the same way as Nectria ditissima on Apple trees. Of course, a number of fungi will live on dead roots, but I have not found any on the live roots which has produced canker. Nectria cinnabarina will grow on almost any kind of detached exposed root, preceded by Tubercularia vulgaris, but neither occurs on living tissue, and if canker occurs at the roots it is generally in consequence of some damage or leaving portions of

broken or detached roots in planting or root-pruning.

I am extremely obliged to "H.P." for his excellent factor in connection with canker:—"I have often found roots of trees, the top growth of which is badly cankered, perfectly free from canker." That completely settles the soil theorists, and Mr. Pendered in particular, whose valued communications have clenched all my arguments, and I am sorry that he thinks I have quoted his letter unfairly. If this is meant to apply to the facts, which I certainly did not question, I tender my best apologies. But that is not the point, for it was not the facts but the deductions Mr. Pendered drew from them that were and are still questioned, and it is quite clear Mr. Pendered could have saved immensely by first finding out the cause before proceeding to apply remedies. Anything short of that is mere quackery. There is nothing like resource, and it is remarkable that Mr. Pendered should reserve the fact of his having cut all the cankered parts away of some trees. Of this he said nothing in his previous letter, and I decline now to entertain it as evidence, for keeping back essential facts is fatal to any case. Nevertheless, the Laurel hedge is put forward as proof that gum on Laurels arises from the soil, yet those on the bank have some dead boughs, or as Mr. Pendered puts it, "scarcely a dead bough," therefore they are not canker

proof notwithstanding the difference in environment of those on the level ground. These Laurels grew rapidly for a few years, but in seven years whole branches died, and growths start again near the bottom. In his previous letter Mr. Pendered said he cleared them away and planted fresh. How does he reconcile the two statements? Or if the soil was the cause of the canker why do shrubs grow again healthily?

Your correspondent may rest assured that the simple remedy he advises will continue to be followed as spasmodically a little longer as it has been during the past 2000 years; but I have no doubt whatever that my "scientific" efforts will be within the grasp of every ordinary fruit grower, and possessed by every schoolboy within this decade.—G. ABBEY.

THE word "orbiculatum" in my letter to you, printed on page 106, August 3rd, fifth line from the top, should have been placed in the next line, after "dendriticum," thus: "var. orbiculatum." It is my mistake entirely.—H. P.

TEA ROSE ERNEST METZ.

"D., Deal," in Journal of Horticulture, page 98, writes in rather disparaging terms of the above Rosc. Can he be aware of the fact that in an election of the best twenty-four Tea Roses The Bride received the highest number of votes, viz., forty-six, and Ernest Metz forty-one; to me this is conclusive proof that leading exhibitors think very highly of the latter. All through June I could gather splendid specimens, but by the time of the National (July 1st) the best were over. In my opinion Ernest Metz is far away the finest and best Tea Rose sent out during the last six years. It was shown in fine form at the National Tea Rose Show (June 20th) this year.—Benjamin R. Cant, Colchester.

SOUVENIR DE LA MALMAISON (BÉLUZE, 1843).

I WISH to say a word about the Rose thus described in the National Rose Society's catalogue. It is a very old Rose, as I have always believed once a favourite with the Empress Josephine. That, however, hardly agrees with the N.R.S. date. It is hardly an exhibition Rose. I remember twenty years ago it had rather a way of appearing in the boxes of Teas of beginners, but it is well worthy of more extensive cultivation by those who are not Rose showers. My intimate acquaintance with it dates from this year. Up to then I never had more than one plant of it in my garden; but last autumn, whilst arranging a very small town Rose garden, a liberal friend who buys his Roses by the beds, seldom less than a dozen of any variety, and who also has a way of changing his Roses, presented me with a whole bed of Malmaisons. T hey were large old plants and were cut in very hard. They began blooming in May, and have never ceased for a day, and seem disposed to keep on steadily until checked by the frosts. It is the nearest instance I have known of a true Perpetual. My hot little shut in garden also suits Teas. The Bride, Waban, Comtesse de Nadaillac, and others of the kind have done, and are doing, very well; but I have had nothing to surpass, or indeed equal, the Souvenir de la Malmaison in the early stage of its bloom. It must be admitted we townsfolk have one valuable advantage—we can turn on the hose whenever needed; and plenty of sunshine and plenty of water go a long way towards perfecting flowers.—A. C.

NATIONAL ROSE SOCIETY.

THE manifesto of the Secretaries of this Society set forth in the Journal, page 97, as a sort of counterblast to my circular to exhibiting members, has caused me some amusement; and although it may annoy other people, they should not take it too seriously, as it can be only looked on as a jeu d'esprit, to which both the Honorary Sccretaries are prone at times. No one, even the proverbial and much-maligned Scotsman, could by at any natural process of reasoning come to the conclusion that my circular was issued by the Society, or required official sanction. If the manifesto be meant as a sly hint to the members that they should not reply to my queries, the Secretaries have been somewhat dilatory in issuing it, and I may mention that these gentlemen were amongst the very first persons to receive the circular, which has been out quite a fortnight.

I have received replies from all the largest as well as many other well informed exhibitors, also from others highly thought of amongst our members, from the President downwards. I am quite satisfied with these replies, many of them accompanied with letters expressive of gratification that these subjects are being at last properly inquired into, and I intend in due time to give an analysis of the opinions expressed. As the Secretaries have taken the trouble to mention the fact of my resignation of Committee, which took place carly last June, I may as well supplement their information by stating that in order that I should in future have no official connection with the Society, I also at the same time resigned my local secretaryship of the Croydon district. No doubt the Secretaries will soon find a better representative.—Charles

J. GRAHAME.

TEA ROSES FROM CUTTINGS.

So immensely popular are Tea Roses, that notwithstanding the vast number of bushes disposed of annually by nurserymen, few gardens can boast of being able to maintain a continuous supply of their deliciously scented flowers. The death-rate of plants in the open air has, during the last two years, been unusually heavy, and in order to obtain a sufficient number of plants to fill up vacancies, a considerable outlay has, in many instances, been necessary. To some this is a matter of little moment, to others it is one of importance; and there are few indeed who would not be glad to expend upon new Roses a greater amount than they at times find available. This I think they might carily do if plants of older varieties were propagated freely each year, so as to have a sufficient stock in hand to fill up gaps, or at least some of them.

I have tried many experiments in connection with the propagation of Tea Roses from cuttings, and I am convinced that if the right kind of wood is selected the present is the best time in the whole year to set about the work. When the right method is adopted it is surprising with what ease and certainty a good stock of vigorous plants may be obtained. The plan I find best is the following. I select the requisite number of short-jointed half-ripened shoots which, if possible, have been severed from the parent plant with a heel attached. Cut in lengths containing from three to five joints, although it is only necessary to have a couple of joints above the soil after the cuttings are inserted. Varieties differ much in the length of joints, and I find that the most vigorous plants are produced from cuttings having a moderate amount of growth above the soil, provided the leaves and stems are kept from shrivelling till young roots are emitted. In preparing the cuttings, cut the base with a sharp knife, trim any projecting portions of bark, remove a couple of the lower leaves, and if needful shorten the top to a good bud.

Fresh yellow loam two parts, with an equal quantity of leaf soil and a liberal amount of sharp sand added, form the compost I employ. This is pressed moderately firm into well drained 5-inch pots and given a surfacing of sand. Half a dozen cuttings are inserted round the sides of each pot and one in the centre. The soil is pressed firmly around the base of each cutting. Failure is frequently brought about through not attending to this simple detail. A watering is then given and the pots be plunged in cocoa-nut fibre or sawdust in a cold frame, one having a north or west aspect is preferable. Much less difficulty is then experienced in keeping the atmosphere cool and moist without resorting to dense shade. No air need be admitted for a couple of weeks, except in dull weather to dry superfluous moisture. The cuttings are syringed once or twice daily during bright weather. This keeps the soil sufficiently moist till air is admitted, but should it become in the least dry upon the surface water is given through a rose, as the least approach to dryness about the base of the cuttings causes the cellular tissue to become contracted, and failure is the result. A little air is admitted daily after the cuttings have been inserted a fortnight.

Some growers make a mistake in being in too great a hurry to pot the young plants directly they see growth has commenced, the result being that they are lost. It is rare indeed that the cuttings have more than callused by the time growth begins, and even when young roots are just pushing into the soil it is a dangerous practice to pot. This operation should be deferred till the roots have obtained a good hold of the soil, and there is no difficulty in determining when they have reached this stage if they are carefully turned out of the pots. Three or 4-inch pots will be quite large enough to transfer the plants to, as it is important to have the soil well permeated with roots before winter sets in. The plants should if possible be wintered in a pit or other structure from which frost is excluded. They succeed fairly well if plunged in coal ashes in a cold pit; but during a long spell of severe frosts they suffer considerably from the damp and confined atmosphere. Under such conditions the plants do not start into good growth in the spring, and much time is lost. When, however, they are kept, as above advised, in heated structures, the wood gets thoroughly hardened during the winter, and the plants are ready for potting early in the spring.

When all danger from frost is over the strongest will be available for planting in beds in the open air, while the remainder may either be grown in pots or planted in a warm corner of the reserve garden. Whichever course is pursued, if good culture is given splendid plants will be produced by the following season. A number of cuttings put in annually will then maintain a constant supply of Tea Rose trees which will be available for all purposes, and being always ready at hand, may be planted at the most opportune times. Any who act upon the advice above given will, I am sure, have no difficulty in raising a good stock of Tea Roses, and, judging from the exclamations I frequently hear, there are not a few who would gladly increase their stock in a way so simple, yet satisfactory. — H. Dunkin, Castle Gardens, Warwick.

NATIONAL ROSE SOCIETY'S PROVINCIAL SHOW AT WORKSOP.

It was a bold venture to hold the Provincial Show this year at the small Nottingham town of Worksop, bold on the part of the local Society which ventured upon the trouble and expense which such a proposition involves, bold on the part of the Society which entrusted the second great event of the season to a small local Society which had indeed for some years been affiliated, but whose modest pretensions had not hitherto given any indication of the more ambitious projects that lay beneath the surface. It is another instance of what can be done when one energetic person undertakes such a work. He infuses his

enthusiasm into powers who warmly second his efforts and do their best to forward the interests of the Society.

It is due to Mr. Henry V. Machin in the first instance, and to Messrs. Whale, Baxter, and the zealous Committee, that all the arrangements were so carefully made; but there is one element in all such matters with which we must have to reckon, but which we cannot control, the character of the weather. As week after week of the continued drought rolled by, the thought could but be present, When this breaks up shall we not have a wet and dreary time? and then came the remembrance of Chester last year, the most disastrous day that the N.R.S. has ever experienced at its provincial shows; and when I arrived at Worksop on the evening previous and was told that already there had been registered 1½ inch of rain that day, one could not but feel that ill-fortune is likely to follow, and that Worksop will be a reproduction of Chester. The morning broke gloomily with a drizzling rain, but happily it cleared off between twelve and one, and the afternoon was tolerably fine; but the wet had had its effect on both exhibitors and the public, and the result was unfavourable in a financial point of view. To anyone who result was unfavourable in a financial point of view. recollected the overflowing show at Chester, that at Worksop must have appeared small, and that it was so was borne out by the fact that in the highest class for seventy-twos there was but one competitor, that the great Essex firms were unrepresented, while from the further south no one appeared except plucky Mr. George Mount amongst nurserymen, and Mr. Budd amongst amateurs.

The Metropolitan Show has by some been rather absurdly called the Rose Derby, but the Derby is but one incident in the great Epsom meeting. The analogy of that great race is to be found in the competition for the much-coveted trophics. Carrying out this comparison I think we may compare the competition for the Jubilee trophies to the race for the St. Leger at Doncaster. Like it, it was carried out on northern ground, and, like it, only stands a little lower in the estimation of winners to the great Metropolitan event. It sometimes happens in these races that an outsider on whom nobody reckoned defeats all the calculations of the book-makers, and so it happened at Worksop; and while anticipations as to whether Budd or Pemberton or Lindsell would carry it off, one whose name was never even alluded to, Mr. A. Whitton of Bedale, bore off the trophy. As to nurserymen everybody concluded that it would go to Messrs. Harkness, and for the second time this firm has accomplished a feat which no other firm has done—namely, carrying off both trophies for the year. It was not so casily won, as Messrs. Alex. Dickson & Sons of Newtownards ran them so close that there were but few points of difference between them; indeed, in one respect they had an advantage—namely, the greater variety of colour in their stand. I think it was disappointment to a good many that Mr. Machin did not take a higher place, but it was no surprise to me, who had heard that he had not cut his Roses until the drenching rain came on. It is but another instance of the fatal mistake that amateurs so often make of putting off the cutting of their Roses until the very latest time possible, especially if the show be near at hand. Let an exhibitor only think at what time the Roses from Canterbury and Newtownards must have been cut, when he will at once see that his best plan is to make hay while the sun shines. Had Mr. Machin but cut his Roses in the early morning of the day before, I have no hesitation in saying that he would have easily taken the premier place. Although the season has been so unfavourable, yet there are some Roses which have been exhibited in as fine condition as ever they were shown in. Take for example Horace Vernet, which has secured the silver medal for the best H.P. both at the Vernet, which has secured the silver medal for the best H.P. both at the Crystal Palace and Worksop. Grand blooms also were shown of Comte Raimbaud, Earl of Dufferin, Duc de Wellington, Victor Hugo, Suzanne Marie Rodocanachi, A. K. Williams, Charles Darwin, Dr. Sewell, Louis Van Houtte; whilst amongst Teas some grand blooms of Ethel Brownlow, Marie Van Houtte, Madame Hoste, a beautiful bloom of which secured the N.R.S.'s medal in Messrs. Dickson & Sons of Newtownards firm, the same flower securing the silver medal in the amateurs' class for Mr. Walter Drew. The Mrs. John Laing, which secured the silver medal for Mr. Pemberton, was a good flower, though I have seen finer blooms of it. Amongst the smaller exhibitors who hailed from the South, few indeed in number, must be noted Mr. Charles J. Grahame of Croydon, Mr. Edward Mawley, the Honorary Secretary, and the Rev. H. H. Gall of Hitchin, all of whom showed exceedingly well, especially when we consider the disadvantages under which they laboured from the long drought.

The wisdom of the alteration in the Society's rules with regard to new Roscs—namely, that of allowing those in the last three years instead of two to be included in the stands—was shown here, as it had already been in the Crystal Palace. Formerly we used to get a few indifferent blooms from grafted plants, whereas now we can not only have our English raised Roses but whatever French ones there are, and they are very few, are no longer from pot plants, but from those grown in the open ground. One has only to recollect what Madame Hoste was when first exhibited among new Roses, and then to see what it is now, is how widely different the flowers are under these two different conditions. Thus probably so good a stand of new Roses has not before been exhibited as that of Messrs. Alex. Dickson & Sons, containing as it did some of their own fine Roses, Marchioness of Londonderry, Margaret Diekson, and Marchioness of Dufferin, Duke of Fife, Gustave Piganeau, which would have been excluded but for the new rule, with the American sport Chabaw, and a few French Roses of no particular merit, but of which we may perhaps hear more by-and-by. While upon this subject I may mention a very remarkable stand of new Roses shown by a local exhibitor. When I say that it contained a white Charles Lefevre, a red

Baroness Rothschild, and a pink Baron de Von Stettin, it will be at once seen how perfectly unique it was. Out of the twelve blooms there were only five correctly named. It could not be disqualified as there were no duplicates, but surely one would think that even a "crock boy" would have known better than to have made such preposterous mistakes, and it seemed very hard to be obliged to give a prize to a stand whose nomenclature was so very mixed as in this case.

Garden Roses, as might have been expected owing to the character of the season, were not largely exhibited, but there was one very excellent stand from Mr. Machin, in which some of the plants, such as the Rugosa, were shown with a good deal of foliage, and I cannot but think that this is the condition in which these exhibits should be seen in future—at least, where the exhibitors are near home—for it is no easy matter to carry these flowers any distance. A bunch of L'Ideale attracted considerable attention, and some bunches of the small Poly-

antha section were very attractive.

As your reporter has already given a full account of the prizetakers and of the flowers they exhibited I have not entered into any details upon these points, but have merely indicated the chief points of interest, and it is to be sincerely hoped that this Exhibition may have given a stimulus to Rose growing in the northern midlands, and that, as in other places, although it may not have resulted in any immediate profit to the local Society, good effects may be felt in future years.—D., Deal.

FRUIT PROSPECTS IN BEDFORDSHIRE.

APPLES are a good average crop. The fruits of many kinds are rather smaller than usual, but now the rains have come they are swelling fast. The Codlin class, such as Lord Suffield, is better than I have seen for some years. Pears, about half a crop upon bush and standard trees, better results on walls. Beurre Clairgeau, Louise Bonne of Jersey, Williams' Bon Chrêtien, and Marie Louise are amongst the best. Plums are a good average crop, Apricots half a crop, Peaches and Nectarines on unprotected walls are carrying full crops and ripening about a month earlier than usual. The trees generally are healthier and better than they have been for some years. Peaches of good size and quality were gathered from the walls the first week in July, but it was necessary to assist the trees with liberal supplies of water, otherwise the fruit would have been very small.

Strawberries showed abundance of blossom, but owing to the late spring frosts, the long drought, and excessive heat, we had only about half a crop, and this was only secured by heavy waterings. Laxton's Scarlet Queen was the pioneer this season, beating John Ruskin and Noble by a few days; Laxton's Latest of All has proved itself a good variety of the British Queen type, of excellent flavour and size. It seems to do well on rather light sandy soil, where British Queen will not succeed. Oxonian was the latest with finely coloured fruit.

Bush fruits have been about half a crop, and very small. These ripened irregularly owing to the long drought. As soon as the fruits showed signs of colouring they were attacked by birds. The little blue tits are very troublesome, they set nets of ordinary size at defiance, flying clean through 1-inch mesh; but owing to the welcome rains we have had during July, upwards of 5 inches, vegetation is making rapid progress. Apples and Pears are swelling very fast now, and promise to be of good size, the fruits of most kinds being clear and bright.

Most kinds of vegetables have suffered from the drought. It has only been from highly cultivated soil, deep digging, and generous manuring that the best results were obtained.—G. R. Allis, Old Warden,

Biggleswade.

NOTES FROM BRISTOL.

BRISTOL, like most large cities in this country, can boast of many good gardening establishments in its suburbs, supported by its most wealthy merchants and private residents who take an interest in some phase of garden work for pleasure or profit or a combination of both. The Chrysanthemum and spring Shows which are held in Bristol testify in a marked degree to the higher class of gardening carried on there, the Chrysanthemum fixture being looked upon as one of the best in the provinces. For want of time I was enabled only to visit a few of the many interesting gardens I am acquainted with, and notes on such may not be without some interest to the many readers of the Journal resident in the district.

SPRINGFIELD.

This is the pleasantly situated residence of F. Savage, Esq. Although good all-round gardening is carried on there are specialities both in winter and summer, foremost of them being Orchids, which are wonderfully well grown by Mr. Edwards, who, it may be said, has held his present position for thirty years, and I believe for the whole of that time has been a constant reader of the Journal of Horticulture. The collection is not a large one, but it embraces sufficient in point of numbers and variety for furnishing a succession of bloom at all seasons. At the present time Odontoglossum Insleayi leopardianum, O. tigrinum, and O. pulchellum are conspicuous, while of Oncidiums O. Cavendishiana, O. sphacelatum—the first named a good form, the latter a fine specimen now fast opening. Oncidium splendidum must have been fine, judging from the size of the remaining portion of the flower stem and the vigour of the plant. O. crispum and O. varicosum are each strong and healthy, and produce a good annual display. O. macranthum,

to my mind the queen of Oncidiums, is here in splendid form; last season its spike reached across the house, and for convenience was trained to the roof girder, and must indeed have been very fine. Lyeaste Skinneri resembles the well known Phaius grandifolius in its growth, and was just pushing forth vigorous flower spikes. Among Cattleyas, gigas Sanderiana was conspicuous by its fine bold growths; this plant last year produced nine of its massive and richly coloured blooms, which measured inches in diameter. C. Bowringiana, C. Skinneri, C. Mendelli, C. Mossiæ, and C. Harrisoniæ violacea were each in a healthy, vigorous state, not mere scraps but fine large pieces. Imported plants of the now popular autumn-flowering Cattleya labiata were noticed, some of which had already bloomed, others being awaited with interest, because of their varying character of growth. Cypripedium insigne in 7-inch pots were carrying twenty and upwards of their useful blooms, which are valuable for house decorating. Dendrobiums nobile, Wardianum, and Farmeri, among others, were noticeable, the plants being fine with an abundant promise of bloom.

Crotons, Dracænas, and other foliage plants and Ferns are grown to meet a large demand for indoor work; while Eucharis, Dipladenias, and Allamandas furnish choice flowers for cutting purposes. Eucharises are particularly strong, and flower frequently, and for the cleaning their leaves no insecticide is ever employed, Mr. Edwards being of opinion that injury to the foliage brings on premature debility, and sometimes failure. Small pots of Adiantum farleyense are always a feature here, and a useful employment is found for them in the house, where they are naturally very striking. Winter-flowering Pelargoniums are given prominence to for cutting purposes, and Poinsettias form another of Mr. Edwards' specialities; a good batch of the late blooming variety, judging from those now remaining, must have been very fine. In 48-pots I noticed bracts measuring from 16 to 20 inches across, and very dwarf in stem. Old plants are started early, and grown vigorously until June, when the tops are taken off and put into small pots, and these plunged in a frame on a prepared manure bed when the thermometer indicates a temperature of 90°. In a fortnight they are rooted and ready for potting, and from that time they are gradually exposed to light and cooler surroundings, so as to keep them dwarf.

Two very light and well ventilated houses furnish a supply of

Two very light and well ventilated houses furnish a supply of Peaches, Nectarines, and Plums from the middle of June to the end of September. The body of the houses are filled with a double row of trees in pots, the lofty back walls having permanent ones trained to wires. All the trees are perfectly clean and healthy; those in pots, as soon as the fruit is gathered, are plunged outdoors and their places occupied with Chrysanthemums for the winter. An excellent provision for increased ventilation is carried out by means of 4-inch glazed socket pipes, conveyed through the centre of the border from end to end. Upright pipes connected with this ventilating drain are placed at equal distance apart, and an upright one at each end outdoors forms the shaft for the conveyance of air into the house without any adjustment of the ordinary ventilators. The outside ones are each fitted with a cover, so that their use can be regulated with ease, and this additional volume of air moving from the floor of the house is of great value in summer, especially in such light structures.

I was interested in the heating arrangements carried out at Springfield. Mr. Edwards is much in favour of small pipes, and find by their use a steady heat can be maintained more easily and with less strain on the boilers than is the case with larger pipes. The mains are 3-inch pipes, and reduced to 2-inch sizes in all the latest built structures which the present proprietor has erected. Two tubular boilers are connected, so that one or both may be used as occasion demands. There are many other points of interest at Springfield which do credit to their owner and gardener, but space does not permit of further detail.—W. S.

(To be continued.)

STRAINS OF GRAPES — CONTINENTAL STRAW-BERRIES.

THE French "viticulteurs," the nurserymen of the craft, such as Etienne Salomon of Thomery, have gone very exhaustively into the classification of the varieties of the Grape Vine. This has led them—as it quite naturally should, and the only wonder is that others, the English specialists included, have not made more of the fact—that there exist many different "strains" of the same, and chiefly of the more popular sorts. For instance the Black Hamburgh, or Frankenthal, has been found to differ in this respect from the standard at least a dozen times; and the Gros Colman is classed with the French in two very distinct strains—the one light leaved (in colour) with large berries, colouring with difficulty, and the leaves dying or ripening quicker; the other darker leaved, berries smaller and colouring very early and quite black. I know all that the difference of soil and manuring can do; but the fact of different strains of the same variety existing cannot be denied, and it would be more wonderful if such were not the case than that it should be a fact.

I recollect reading some time ago in the Journal some queries about the Marguerite Strawberry. The Marguerite Libreton, raised by Libreton in 1856 or 1859, I do not recollect which, is a very large light rose and very early Strawberry, of a most regular tapering shape. I have seen some grown by a specialist of Brussels, now departed (De Jonghe) 3 inches long and 2 inches across the shoulder. There were two on the plant which had only two or three leaves, and grown in a small pot. It was the best market Strawberry for forcing, but is much discarded

now. It is not of first quality; it mildews easily; and the chief cause of its not paying is—it is soft and does not keep; the shop people do not like it.

The Strawberry best liked for forcing here is Louis Vilmorin. It is not an early sort, but grows very sturdy; few leaves; sets capitally; is of dark varnished red; keeps and travels the best. By starting early enough and quite gradually they come as soon as any other; the first fruits are large. The largest Strawberry is considered to be Maréchal MacMahon, all the fruit comes large; also Dr. Morel, which strange to say (I have been told so) forces well on hotbeds, but mildews fearfully if forced by hot-water heating.—Helenevell.

THE WEATHER IN LONDON.—After local thunderstorms towards the end of last week, and much hail in places, a sudden change occurred. On Monday and subsequent days this week the weather has been of a tropical character, the sun being powerful and unclouded, but meteorologists have discovered a "depression" somewhere, and expect it to reach us in the course of a few days.

— DUTCH HORTICULTURAL SOCIETY.—The members of the "Dutch Horticultural Travelling Society" were present at the last meeting of the Royal Horticultural Society at the Drill Hall on the 8th inst. The conductor of the party was Mr. J. K. Budde, the Curator of the Botanic Garden, Utrecht.

VERMOREL'S ECLAIR.—You had better warn your readers that Vermorel's sprayer cannot be used for emulsions containing soap or oils, minerals or others. In a few hours' time the indiarubber organs would be destroyed. Mr. Vermorel in his notice points out the fact. The Eclair is to be used for bouillie bordelaise alone; at any rate, never with any compound containing soap or oils.—H.

— Johnson's Gardeners' Dictionary.—The new edition of this work will soon be completed, the sixth part having come to hand. This instalment includes the portion of an article on Mushroom culture, and ends with a description of the genus Pleopeltis. Two more parts are, we believe, to be published to complete the book.

- DEATH OF MR. THOMAS LAXTON.—Just as we are preparing for press we learn with much regret of the death of Mr. Thomas Laxton of Bedford, which occurred on Sunday afternoon, the 6th inst., after a distressing illness of eight weeks' duration, at the age of sixtythree years. As is well known, Mr. Laxton was one of our chief experts in the art of cross-fertilization, and he exercised this art with remarkable diligence and success. He has added to our gardens new flowers, vegetables, and fruits that will long keep his name in remembrance. Only a few days prior to his death we were reminded of his achievements in the form of a coloured plate of the new Strawberry Laxton's Royal Sovereign—a splendid early variety, as large as Sir Joseph Paxton, with much of the British Queen flavour. This Mr. Laxton considered his masterpiece among Strawberries, and the distribution of plants, we presume, will be continued by his sons—the Laxton Brothers, Bedford. Well it will be if they have inherited their father's skill in the work in which he engaged so zealously over a number of years.

— PHILOSOPHY OF DRAINAGE.—Few cultivators understand how water operates in soil culture. One of its chief uses is to purify the soil. The roots of plants require the agency of oxygen in preparing food, just as much as the leaves do; and after the air has lost its oxygen it is impure and unfit for the use of the plant. A heavy fall of rain completely saturates the soil and drives out the impure air, and as this water passes away a new supply of air follows. In no other way can the soil be rendered free of impure air than by this curious process of Nature. In brief, says "Meehan's Monthly," rain is a purifier of the earth. Of course the soil rctains moisture, and from this moisture the roots subsequently are enabled to draw their supply. This is necessary, but air is no less necessary than the water. One of the most interesting treatises on the subject, and by which this paragraph has been suggested, is an essay delivered before the Marion County Horticultural Society of Salem, Oregon, by President John M. Bloss, of the State Agricultural College, and Director of the Agricultural Experiment Station.

- —— GARDENING APPOINTMENT.—Mr. J. A. Cox, who has been the past nine and half years foreman at Aldenham House, Elstree, Herts, has been appointed gardener to the Hon. A. Holland Hibbert, Munden Park, Watford, Herts,
- PRINCE CONSORT'S ASSOCIATION.—This Association recently held its fortieth exhibition in Windsor Home Park. Collections of plants were arranged by Mr. O. Thomas, Royal Gardens, Frogmore, Messrs. Sutton & Sons, and Mr. C. Turner.
- PROFITABLE CULTURE.—It is quite certain, says the "Rural World," that to make agriculture pay in this country it must approach market gardening to a greater extent than it does, which means more work for the rural labourer and better profits for the farmers.
- —— SANDRINGHAM FLOWER SHOW.—This annual exhibition was held on Wednesday, August 2nd, and proved a great success. The fruit, flowers, and vegetables staged by the cottagers were plentiful and of good quality. The Sandringham gardens were open to visitors, who were more numerous than for some years past.
- —— St. Mary's Fields, Hampstead.—The preservation of these fields as an open space is engaging attention in the district. At a meeting held on Wednesday evening August 2nd, at St. Mary's Hall, Abbey Road, Hampstead, presided over by the Earl of Meath, resolutions in favour of preserving as a public recreation ground the portion yet unbuilt upon of St. Mary's Fields were unanimously adopted.
- PAVIA MACROSTACHYA.—A fine specimen of this beautiful late flowering North American shrub was recently in full bloom in Mr. Smee's garden at Hackbridge, but suddenly died last week as if through the effects of lightning. The flowers are produced with great freedom and in dense plumy spikes. The growth is spreading and the foliage abundant, in rich contrast to the wealth of bloom. Ample space must be accorded to this plant to allow it to spread out in its own characteristic way, whilst it thrives in any good garden soil.
- —— PARKS AND OPEN SPACES.—The Chairman stated in the course of his address at a recent meeting that the parks and open spaces under the charge of the London County Council had had their area increased by 1000 acres during the past four years. The Council possesses fourteen parks, thirty open spaces, and twenty-two gardens, the annual cost of maintenance of which is £82,992, but there are few items of expenditure devolving upon the Council that receive more general approval than the expenditure in connection with London's open spaces.
- SUTTON'S Al TOMATO.—At the first Exhibition of garden produce held last week at Purley, the best dish of Tomatoes was this not yet very well known variety. It is of the Challenger type, but is larger, the fruits being more deep than broad. Perhaps for that reason the exhibitor (Mr. Houlder) had it set up in heaped form, when the full depth, form, and solidity of the fruits were made so much the more apparent. A good dish of a flat round variety, the fruits set out singly, looked best at the first, but the fruits were found to be lacking the depth and weight as well as the finish of the A1 variety. I saw the plants from which these fruits were gathered later in Mr. Houlder's garden, growing in a small span house and fruiting splendidly. I think these deep or Apple-shaped Tomatoes will become popular. At the same Show a very beautiful group of Begonias interspersed with effective Caladiums and various flowering and foliage plants was staged by Mr. J. M. Box of Croydon, who is an extensive grower of excellent varieties.—A. D.
- PHACELIA CAMPANULATA.—There are many shades of blue in annuals, and the most popular one just now seems to be the familiar Cornflower, Centaurea Cyanus. As a buttonhole flower this has been extensively worn during the past season. It is hoped that some day it may be possible to obtain a selection that shall give a richer colour than in even the best forms found in a garden strain. But one of the most beautiful of all blue flowered hardy annuals is Phacclia campanularia, a somewhat dwarf grower, and giving a fine mass of colour for bodding. I saw this in grand form and colour the other day in Messrs. Sutton & Sons' seed grounds at Reading, and as it was then still hot and dry the result showed that this Phacelia is a capital dry weather It is also very hardy, for if sown so late as the end of September the plants will pass an ordinary winter. The colour of the cup-shaped flowers, which are about the size of those of Nemophila insignis, is just the intense blue of Salvia patens. It is indeed a beautiful flower.-A. D.

- —— FRENCH MARIGOLDS.—We have pleasure in sending a few blooms of our French Marigolds for your inspection.—Dobbie & Co., Rothesay. [The blooms sent were of excellent substance, and: the colours perfectly defined.]
- —— CARNATION LOTTIE KIRLEW.—Herewith I send you flowers of a new yellow-ground border Picotee named Lottie Kirlew, of which I should like your opinion.—GEO. HOLMES. [The flowers are very good, and the variety will doubtless become popular when well known.]
- VIOLA MISS CANNELL.—Mr. H. Cannell writes:—"I think you will say my Viola (Miss Cannell) is decidedly whiter and more effective than the renowned Sylvia, it has a far better habit. I send blooms of both." [Though the blooms were curled up through resting in the post over Bank Holiday the greater purity of Miss Cannell was very apparent.]
- Golden Rocca Onion.—"W. K. W." writes:—"This is a great improvement upon Giant Rocca, and is the best variety for autumn sowing. This opinion has been firmly fixed in my mind by the numerous fine beds of it I have recently met with in various Norfolk gardens, especially some splendid samples thereof at Sennowe. The bulb is of a beautiful straw colour when mature, large in size, and of most handsome shape. For exhibition purposes I believe it is unequalled."
- CONTINUITY LETTUCE.—The same correspondent observes:

 —"Another good thing which has received much praise this season from many Norfolk gardeners is Daniels' Continuity Lettuce, a brownish coloured Cabbage kind of good size. In spite of heat and drought during the past months it has wherever grown developed large solid heads, which appear to stand longer than those of any other known variety."
- CAMPANULA GRANDIFLORA MARIESI. Referring to the plant figured on page 103 last week, Mr. George Paul writes from The "Old" Nurseries, Cheshunt:—"I think the plant is Japanese, and was introduced by Maries. It is a dwarf hardy form of Platycodon grandiflora. I think it wants the south slope of a rockwork, and probably, having done so well this year, likes a warm summer. These Japanese plants vary much, probably from the island they come from, but I should think they would like England to be just a little warmer to feel quite at home."
- METEOROLOGICAL OBSERVATIONS AT HODSOCK PRIORY, WORKSOP, NOTTS, FOR JULY, 1893.—Mean temperature of the month, 60.9°. Maximum on the 18th, 84.7°; minimum on the 28th, 42.3°. Maximum in the sun on the 8th, 135.9°; minimum on grass on the 28th, 35.7°. Mean temperature of air at 9 A.M., 62.5°; mean temperature of soil 1 foot deep, 61.4°. Total duration of sunshine in the month 154 hours, or 31 per cent. of possible duration. We had three sunless days. Total rainfall, 3.98 inches. Rain fell on eighteen days. Approximate averages for July—Mean temperature, 60.7°. Sunshine, 160 hours. Rainfall, 2.42 inches. A showery, wet month, rather warmer than the last few years.—J. MALLENDER.
- UNRIPE AND DECAYED FRUIT. The "Lancet" says:-"Nothing is more essential to method in learning than frequent reiteration, and it is therefore needless to plead excuses in seeking thus to impress even the elementary facts of sanitary science. It might be supposed that by this time everyone understood the importance of observing particular care in the selection of a summer dietary, especially as regards fruit. Hardly any question of domestic management is either more vital or more elementary; yet error continually arises in this connection in the simplest way. A few days ago a child died soon after eating Strawberries. Why? Because the fruit had been purchased two days previously, and, as was only to be expected, when eaten was in a state of decay. It is impossible to resist the impression that neglect had something to do with the sad result in this instance. Luscious fruits are particularly liable to putrefactive change, and such thrifty processes as exposure to a cold and dry air, spreading out and the like, suffice only to postpone decay for a brief period. We cannot do better than point to the incident above mentioned in order to remind the vendor and the purchaser alike that freshness is the only certain guarantee of safety when any succulent fruit forms an article of diet. We have not forgotten that another hardly less serious danger of the season awaits those who indulge in fruit which is under-ripe. In this case taste as well as judgment commonly interpose a caution the importance of which can hardly be exaggerated. Yet here, also, the consequences of neglect have too often been sadly apparent."

- THE TOTAL RAINFALL FOR JULY AT ABBOT'S LEIGH, HAYWARD'S HEATH, SUSSEX, was 3 48 inches, being 0.82 inch above the average. The heaviest fall was 0.59 inch on the 4th; rain fellon sixteen days. The highest temperature in the shade was 74° on 12th, the minimum 42° on 28th. Mean maximum 73°, mean minimum 58.28°, mean temperature 65.62°. Mean in the sun 83.6°. A very favourable month. Vegetables now make rapid progress.—R. I.
- JULY WEATHER IN HERTS.—The past month here has maintained its character of being one of the wettest months of the year. This season the rain was much needed, and vegetation has gone forward by leaps and bounds. The early part of the month was intensely hot. Rain fell upon seventeen days during the month. Maximum in any twenty-four hours, 0.72 on the 26th; minimum in any twenty-four hours, 0.01 on the 13th. Total during the month, 3.06, against 4.02 of 1892.—E. WALLIS, The Gardens, Hamels Park.
- THE WEATHER LAST MONTH.—July was very changeable and showery, with only four really bright days. Barometer fluctuated very much. The highest reading was 30·30 at 9 A.M. on 28th; lowest, 29 54 at noon on 20th. Wind in a westerly direction eighteen days. Total rainfall, 2·41 inches, which fell on twenty days, the greatest daily fall bring 0·50 inch on the 2nd. The total is 0·31 inch below the average for the month. Temperature in shade: highest, 87° on 7th; lowest, 40° on 28th; lowest on grass, 33° on 28th. Mean daily maximum, 69·63°; mean daily minimum, 52·64°; mean temperature of the month, 62·27°. We had several thunderstorms. The garden spring ran 17 gallons per minute on 31st.—W. H. DIVERS, Ketton Hall Gardens, Stamford.
- GARDENERS' ORPHAN FUND.—The monthly meeting of the Committee was held on the 28th ult. at the Horticultural Club, Hotel Windsor, W. Marshall, Esq., in the chair. Matters of interest connected with the administration of the Fund were discussed, and reserved for further consideration. The Hon. Secretary announced the following receipts:—From Mr. J. Lyne, local Secretary, The Gardens, Foxbury, Chislehurst, £16 ls.; Mr. G. W. Cummins, local Secretary, The Gardens, The Grange, Wallington, sale of flowers at Croydon Horticultural Show, £8; collected at the Wimbledon Flower Show, £4 2s. 6d.; and box per Mr. J. Kneller, The Gardens, Studley Royal, Ripon, 9s. The next meeting of the Committee will be held on the last Friday in October.
- LINCOLN'S INN FIELDS. The Parliamentary Committee reported at the meeting of the London County Council, held on August 1st, that they had been advised by the solicitor and the Parliamentary agent that the way in which the Council would be most likely to be successful in obtaining possession of Lincoln's Inn Fields as an open space for the public would be by sceking compulsory powers of acquisition under the terms and provisions of the Lands Clauses Act. They recommended that they be instructed to preparc a Bill accordingly, and communicate with the Benchers of Lincoln's Inn and the trustees of the garden concerning same, and inviting them to enter into a conditional contract for the sale of the area within the square. This was agreed to.
- PRESENTATION TO MR. MEEHAN. On the 4th of July at Vernon Park, Philadelphia, the citizens of that city presented to Mr. Thomas Meehan a handsome silver plaque as a testimonial of their appreciation of his services in establishing small parks in various sections of the city. The plaque is of solid silver, 19 inches by 24 in size, and framed in carved mahogany, set in a polished mahogany shadow-box covered with plate glass. It is etched with oxidised shading to represent the original parchment granted to William Penn. In the central part of the top of the plaque is the following apt quotation from Penn's letter to his Commissioners, dated September 30th, 1681 - "That it may be a green country town and always wholcsome." We have more than once called attention to the singular value of Mr. Meehan's work, and we are glad to know that he is one of the prophets who is not without honour in his own country. Onc of the speakers at the presentation called attention to the extraordinary spectacle of a man elected and re-elected to the City Council for a decade of years by the common consent, and, in fact, by the urgent desire of the leaders of all parties and all factions, simply because he has pursued steadily the work for which he was fitted by his own good judgment and training. It is rare indeed that any one man is able to do so much good in a civic position; rare, too, that he can command the confidence of his fellow citizens so generally, and rarer still that they manifest such a grateful appreciation of unselfish work.—("Garden and Forest.")

- Extraordinary Fasciation in Anthemis. We have received from the Rev. F. E. Ainger, of Newcastle-on-Tyne, an interesting specimen of the fasciation of Anthemis Cotula. The most ordinary example of the monstrous growth in plants known as fasciation is to be scen in the Cockscomb. There the stalks and petioles of the plant are all massed and confounded, while the flowers appear at the top in the curious scarlet crest which forms the attractive feature in its cultivation. The Anthemis Cotula sent by Mr. Ainger exhibits a similar distortion. The stalks lie conglomerated together in a broad markedly ribbed band, not unlike the leaf of an Iris, of about a foot in length, and surmounted by a dull yellow crest similar to that of the Cockscomb. All around the massed stalks appears a network resembling a parasite, but which is in reality an excess of the leaves, petioles, and flowers of the Anthemis remaining incorporated with the other solidified portions. At a superficial glance the whole looks like an Anthemis climbing, Dodder-wise, round a flag, but the terminal cristate growth upsets this theory.
- BURNT FRUIT AT THE WORLD'S FAIR.—The only exhibitor's fruits saved from the burning of the Cold Storage Building at the World's Fair were, says an American exchange, about five barrels of winter Apples, belonging to New York, which were dug from the ruins three or four days after the fire. These Apples were put on exhibition, and they now occupy about 350 plates on the tables formerly used for the Lemon display of Riverside County, California. They are still in presentable condition, and include Baldwin, Roxbury Russet, English Russet, Golden Russet, and Campfield. California has received Oranges from the Pacific coast to supply her loss in the fire.
- MUSHROOMS AND TOMATOES.—Have you ever tried Mushrooms and Tomatoes cooked together? If not, says a writer in "Truth," you will thank me for this recipe:—Remove the peel and stalks from seven or eight good sized fresh Mushrooms; lay them, the hollow part upward, on a buttered sauté-pan, put a small piece of butter on each, season with salt and pepper, cover with a lid and cook them in a hot oven for twenty minutes. Meanwhile prepare a similar number of round pieces of toast buttered on both sides. Fry an equal quantity of thick slices of ripe Tomatoes. Now place a slice of Tomato on each piece of toast, and finish with a Mushroom on the top. Dish on a white paper and serve very hot.
- THE SIBERIAN CRAB AS AN ORNAMENTAL TREE.—The great utility of this tree as an ornament in the garden. It is evident that it is appreciated by A. W. Smee, Esq., The Grange, Hackbridge, as many trees are to be seen in his garden. At the present time the fruits are just ripening—a month earlier than is customary—and the sight presented is a very beautiful and at the same time a very unique one. Planted here and there on the borders the trees are universally admired. Apart from their beauty, it should be borne in mind that from the fruits a most toothsome and nourishing jelly can be made; the tree, therefore, has two points at the least which render it desirable in every garden—it is pleasing to the eye and also to the palate.—H. W.
- CLERODENDRON FALLAX.—"W. B." writes:—Seedlings of this plant should not be allowed to become checked in small pots, or they will fail to do satisfactorily. To grow these plants well they should be potted directly they need more root room, when they will abundantly repay for the care bestowed upon them by the large scarlet trusses they are capable of producing. These plants in their early stages ought to be grown in heat, and afterwards in an intermediate temperature. They must be kept growing freely from the first to the time they show flower. When the plants are in full growth the points may be removed, and the plants induced to branch. It is useless pinching them after they show flower, especially if the plants have become woody through checking them.
- Battersea Amateurs' Horticultural Society.—This Society held its first annual summer Show on Bank Holiday in a field kindly lent for the occasion by Percy Thornton, Esq., M.P. The number of exhibits was large, some good plants being shown by the amateurs o the district. A charming group of plants was arranged by Mr. W. Welsford, Binfield and Lansdowne Nurseries, South Lambeth, which included amongst others perennial Phloxes, Asters, Delphiniums, Hydrangeas, and stove and greenhouse plants in great variety. Mr. G. B. Fischer, florist, 30, High Street, Clapham, staged a highly creditable collection of stove and greenhouse foliage plants, as also did Mr. W. Charman, gardener to H. Russell, Esq., Beechwood, Clapham Common. A fine collection of Ferns was shown by Mr. Brown, gardener to H. Ravenhill, Esq. Clapham Common.

— Wasps.—A wasp plague continues to cause great inconvenience in the neighbourhood of Dover. A curious incident, says a daily contemporary, happened on Saturday in a village near Sandwich. A labourer discovered a wasp's nest, and struck with the beauty of its formation instantly took it home and carelessly put it aside, with the object of taking it to a naturalist. The nest proved to be full of eggs, which the warmth of the house developed during the night into hundreds of wasps. When the family awoke in the morning the house was swarming with wasps, and the family had to make their escape as best they could. Some of them were severely stung. We do not think this man will take home another wasp's nest.

- GARDENING AT THE WORLD'S FAIR.—The picturesque dwarf trees of Japan interested me greatly. One old Cypress, 300 years old, perished during the winter, but there were some ancient crooked Maples, about a foot high, and a Pine tree with gnarled branches and massive roots that would have adorned a forest in Lilliput, for they were not more than 18 inches high. Every leaf had been carefully trained on the Maple, and the pine-needles were held imperceptibly in place to produce that fine cushiony effect that is so highly prized. It seemed like looking at some venerable monarch of the forest through the reverse end of an opera-glass, so perfectly did the Lilliputian tree reproduce all the storm-wrought eccentricities of the great one. Among other curious objects says a writer in "Garden and Forest" was the exact model of a Japanese garden, quaintly rendered, with little figures crossing its toy bridges or lingering by its tiny lake. Here were the hillocks, the cascades, the stonc lamps, the sheet of water, the smooth stones, the summer houses hidden in the clumps of trees, the flowering shrubs, the groups of Irises by the water's edge—a complete and fanciful little pleasure ground within the circumference of a large

- EWELL HORTICULTURAL SOCIETY.—The twenty-ninth annual Exhibition of this Surrey Society was held on a nice fine day on the beautiful grounds of The Grove, the residence of the ex-Lord Mayor, Sir D. Evans. The grounds were thrown open to the public, and their entire keep, which is really first-rate, reflects on the gardener, Mr. Quinton, the highest credit. Of plant groups there was a very fine one sent by Messrs. J. Laing & Sons, Forest Hill, of Begonias, Gloxinias, Caladiums. Foliage plants—i.e., of the competing groups—the largest and best was set up by Mr. Whiteman, gardener to A. W. Gadesden, Esq. Mr. Worsfold, gardener to Lady Glyn, coming second with a charming arrangement; and Mr. Quinton was third. Mr. Whiteman had the best six foliage and flowering plants; also the best six Begonias, excellent specimens, and the best six Fuchsias. Mr. Quinton had six superbly flowered Zonal Pelargoniums, some 3 feet through, and well grown. Several noble Palms sent by Mr. Whiteman helped to decorate the flower tent. Hardy flowers were in capital form, the best twelve bunches coming from Mr. Worsfold, whose selection and setting up were excellent. Mr. Elsey, gardener to Miss Carlisle, was second. Mr. Worsfold had the best twelve bunches of annuals, a capital lot of flowers, Mr. Elsey again being second. Mr. Quinton was a good first with four dishes of fruit, having finely finished Alicante Grapes, Royal George Peaches, Elruge Nectarines, and Jargonelle Pears; Mr. Worsfold was second. Vegetables all round were excellent, and one class is mentioned elsewhere. An odd class was that for head gardeners' bouquets, the best coming from Mr. Whiteman, whilst in the class for under gardeners' bouquets Mr. Simmonds, from the same place, was first, both being admirably arranged. After the usual presentation of prizes, kindly performed by Lady Evans on the lawn, Mr. A. Dean, for the Surrey County Council, gave a short address relating to gardening, for which, on the proposal of Mr. David Evans, a cordial vote of thanks

— Exhibiting Vegetables. — For a pretty, neat, compact method of showing vegetables I have seen none better than was found last week at the Ewell Show, where five lots of six kinds were set up in large punnets, or rather shallow white baskets, 12 inches over. It is a requirement of the schedule that the exhibits shall be so displayed, hence the result is uniformity in appearance, if not in quality. Again, the size of the punnets used checks the exhibiting of products of undue dimensions, which is an excellent result. The class being for gardeners capital exhibits were staged. Mr. H. Pedrick, gardener to Col. Norbury Pott, had for the season good Cauliflowers, Scarlet Runners, G. F. Wilson Peas, Perfection Tomatoes, Ashleaf Potatoes, and pretty white Marrows. Mr. Ayling, gardener to W. M. Walters, Esq., who came second, had capital Satisfaction Potatoes, Canadian Wonder Dwarf Beans and white Turnips.—A. D.

— AILANTUS GLANDULOSA IN AMERICA.— Superintendent W. R. Smith of the Washington Botanic Garden says that Ailantus glandulosa is of all trees the one for narrow streets. Its large foliaceous development keeps it vigorous and healthy. The only objection to it is the unpleasant fragrance of the flowers. This can be entirely avoided by treating the tree as a pollard, as is the custom in Paris. It never flowers because of the pruning. The law made by Congress against its being planted in Washington was owing to the influence, we believe, of a well written article by Mr. Downing. Don Piatt was, perhaps, the last to dare the law and plant one of these trees in the aristocratic quarter of Washington. His keen sarcasm, which found expression in his paper known as "The Capitol," prevented the authorities from interfering with him.—("Garden and Forest.")

—— SWEET LAVENDER.—The cry of "Sweet Lavender" heralds the close of the summer season, and old-fashioned housewives will be garnering their store of scented blossom to perfume linen presses and wardrobes, and for the more prosaic routing of the destructive moth. Lavender derived from the English plant, whose scientific name is Lavandula vera, has many medicinal properties, which make it valuable as a corrective adjunct to other medicines, while alone it is aromatic carminative, and stimulative. The oil distilled from the Lavender plant is valuable in hair lotions, and the following recipe, says the "Lady," will be found admirable to stimulate the growth of thin or weakly hair: -Oil of Lavender, 6 dr.; lard, melted with twenty drops oil of Nutmeg, 1 oz.; Cocoa butter, 5 dr. Lavender is highly antiseptic, and therefore invaluable in the sick room; but it must be the pure extract, and not the artificial product which now figures largely in perfumery, and is obtained from petroleum and other sources. Artificial perfumes have a heavier and less agreeable odour than the natural ones, however skilfully manipulated, and excessive use causes headache and dizziness; while the natural odour obtained from Lavender is most soothing in headache and lassitude. Very few people are aware of thevirtues of Lavender as a skin lotion and cosmetic. A little strong, good Lavender water, diluted with about an equal quantity of water, forms a valuable wash for the skin where the pores are enlarged or after exposure to the sun. The skin may also be bathed with a solution of Lavender water when heated or inflamed, and during severe bilious headaches, or in the agonies of mal de mer, much relief is obtained by bathing the throat, forehead, and temples with good Lavender water, while a spray is most refreshing to travellers by land and sea.

- STARCH FORMATION.—When a leaf is exposed to sunlight it is well known that among the earliest changes noticeable is the formation of starch; and, further, that this starch production is stopped by placing the leaf in the dark, so that if half of the surface of the leaf be exposed to the sun, and the other half be covered with opaque paper, the uncovered half will contain starch, while none will be formed in the covered portion, and that which it had previously will disappear. It had come almost to be an article of faith, says the "Gardeners Chronicle," that this starch formation was the primary and universal result in the process of "assimilation," which is consequent upon the exposure of the green material (chlorophyll) to light, and the elimination of oxygen. Working physiologists, indeed, were more cautious in their utterances than text-book writers and teachers. It now appears from the recent researches of Messrs. H. T. Brown and G. H. Morris, as presented to the Chemical Society in April last, that cane sugar is the first product (and not glucose, as had been by many supposed), and as this sugar is formed faster than it can be utilised, the excess is deposited in the form of starch. This reserve of starch is drawn upon when the light fails, the starch being then dissolved by a ferment, or "enzyme," known as diastase, which is secreted by the protoplasm of the cell in amount proportionate to the needs of the case, so that the formation of diastase is looked on as an effort to remedy the consequences of defective nutrition. The course of events in the process of assimilation appears to be, first, formation of soluble cane-sugar, then deposition of insoluble starch, followed by formation of diastase-ferment, which dissolves the starch and allows of its transmission in a fluid state, or as sugar, from the place at which it is stored to the place where it is used up in the processes of growth and activity, which demand supplies of nourishment for their fulfilment.

DIANTHUS CALLIZONUS.

THOUGH this beautiful alpine Pink was discovered nearly half a century ago it is still new and rare in gardens. It is a native of Transylvania, where it is found at an elevation of 6000 to 7500 feet. It has a certain resemblance to D. alpinus, but the flowers are half as large again, and altogether it is a finer and more robust plant.

The flowers are of a bright rose-purple with a darker zone speckled with white round the throat. The leaves are lanceolate and glaucous, like those of D. cæsius.

The plant forms dense tufts and flowers very freely. As it possesses a robust constitution, is quite hardy, and will thrive in almost any situation, it will no doubt soon become a common garden plant. It strikes freely from cuttings. It is certainly the finest alpine Pink at present in cultivation. The engraving (fig. 19) was prepared from a sketch of a plant growing in the Royal Gardens, Kew.—A. B.

HARDY FLOWERS IN MASSES.

ALTHOUGH an extensive collection of hardy flowering plants produces a bright and continuous display in the herbaceous border, yet when we see large masses of individual kinds by themselves we think

down the names of a few of the many interesting plants there to be found. Mr. Ladhams makes a point of adding to his collection all new or improved types of recently introduced kinds, which renders a visit all the more interesting.

all the more interesting.

Amongst the Campanula family the newer Platycodon grandiflora pumila Mariesi is superior to most other forms. This Japanese variety grows barely 2 feet high, and bears very large pure white blossoms, and is quite self-supporting. The pale bluc and rieh purple forms make a bold display in large masses. C. persicifolium album grandiflora has flowers fully twice the size of the old variety, and is therefore a decided improvement. C. latifolia maerantha has rieh purple flowers, quite the best of the type. That pretty, dwarf, free-flowering, double Sweet William—Dianthus barbatus magnificus—with its intensely deep crimson flower heads, deserves more attention than it receives at present. The yellow Foxglove, Digitalis aurea, is represented by one named grandiflora, and is receiving some attention, as Foxgloves of this colour with reasonable sized blooms are none too common. The older D. ferruginea has blooms

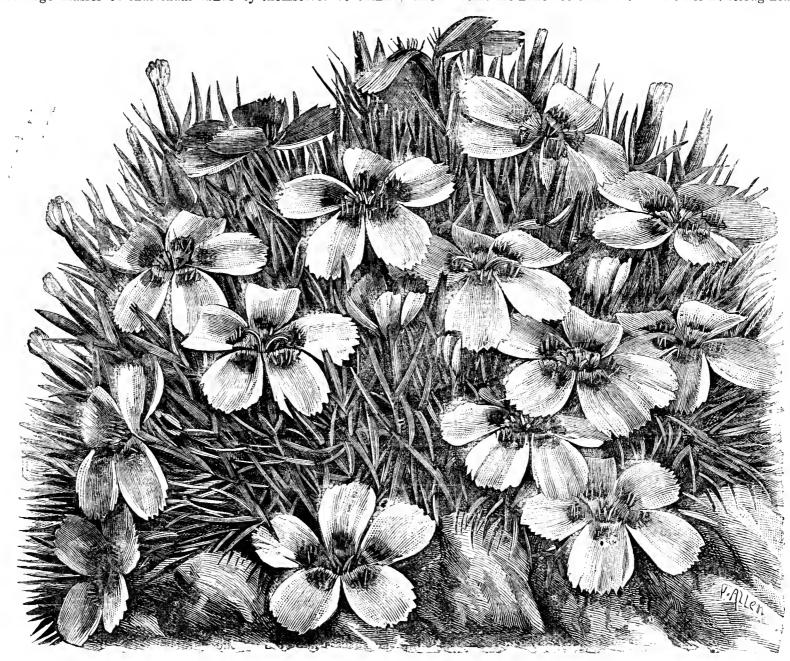

FIG. 19.—DIANTHUS CALLIZONUS.

they are even then more effective than when isolated perhaps in the mixed border. It is not, however, in private gardens that we must look for extra large elumps of any one particular kind, such as, for instance, a patch of Heuchera sanguinea 30 feet long and 3 feet wide, a mass of its gorgeous colour; space does not admit of this form of arrangement, even if the means did. Although half a dozen plants of this gem make a bold display in a favourable nook in the rockery or in the ordinary border, one cannot compare the effect with that of the larger mass.

A hasty look through the herbaceous department of the nursery of Mr. B. Ladhams, Shirley, near Southampton, who has devoted much time and space to this section of flower growing to meet the great demand caused by the increasing love for hardy flowering plants, gives one much insight into the many varieties and kinds now so largely cultivated as seen growing side by side. The beds are arranged parallel to each other in varying lengths, all 3 feet wide, for the sake of convenience in planting and attention. Much of the ground occupied for this purpose was once a huge gravel pit, and to see the shingle-like soil it is surprising how well the different plants thrive. In spite of the remarkably dry season a bright display has been maintained, showing well the holding character of the soil, which is kept well stirred, and thus prevents the evaporation of moisture to a great extent. For the benefit of readers of the Journal I jotted

far too small and rusty looking to be attractive. Agrostemma celirosea is particularly bright and showy. The rosc-coloured form of Veronica spicata is bright in a mass, growing from 1 to 2 feet high, and entirely self-supporting.

The Statice family receives a good deal of attention. The flowers are found so useful in a dry state for winter decoration, for if cut when fully developed they retain their natural colour for a couple of years. S. ineana nana is the best of the type, the large spreading heads of flower give such a variety in colour. Some especially deep in tint were being preserved for future use in hybridising. In the same way the Eryngiums are employed, amethystinum and giganteum varieties were being cut in masses. A grand patch of Erigeron aurantiacum was just over, another of E. philadelphicus was a sight to behold, growing only 1 foot high, and freely flowered; this is quite one of the best of the family. Dracocephalum virginianum album, sometimes called Physostegia, is worthy of a place in any collection large or small; its pure white flowers deserve to be appreciated. Gaillardias occupy much space; the grandiflora type is the more showy either when growing or in a cut state, but a stock of the pale yellow double-flowered Vivian Grey demands more than a passing notice. Plants of Aehillea The Pearl are to be seen advancing to the flowering stage. Anthericum liliastrum, with its tiny blossoms of pure white, contrasts well with its more showy

neighbours; this variety is by some preferred to the larger-bloomed A. L. major. Masses of the yellow Aquilegia chrysantha, a remarkably interesting plant, and perhaps still the best of the Columbine family, were quite charming. Asphodelus luteus and ramosus are showy and quaint. Astrantias are generally neglected plants in private gardens, but large batches of them are grown to meet the demand, as their merits are appreciated. By far the best of the perennial Cornflowers is the soft yellow variety ruthenica, the flowers being useful for cutting.

Chelone barbata, one of the most distinct and showy of hardy plants, is represented by spikes of bloom from 3 feet to 4 feet high. The merits of Chrysanthemums maximum and the later flowered variety latifolium are here thoroughly recognised, large batches of both are cultivated to meet the increasing demand. The present is not a good year for Delphiniums, the flower spikes being rather poor. Thousands of seedlings are raised annually, selected from approved strains, and these small plants withstood the unfavourable weather well. Dictamnus

fraxinella is a showy plant, not nearly enough grown.

Gypsophila paniculata is a plant growing in favour, it is so useful for cutting and mixing with other flowers. A very pretty dwarf growing white flowered Galega was noticeable, its compact habit rendering it worthy of culture. Huge masses of Helenium pumilum were in gorgeous array, the rich yellow flowers were so freely produced at this early date. Hyacinthus candicans was throwing up numerous flower spikes, the bulbs having withstood the sharp frost of the last winter quite unharmed. In heavy soil the bulbs refuse to live over one year with me. Linum campanulatum grandislorum has flowers like the old blue perennial variety in form, but much larger, and being yellow it is a striking plant, growing near 2 feet high. The drooping point of the pure white spikes of Lysimachia clethroides at once arrests attention of hardy plant lovers. This is of vigorous growth, a single root quickly spreading a long way. Michauxia campanulata is well worth attention, the bluish white, bell-shaped flowers are distinctly attractive. A very pretty early flowering and dwarf growing Phlox is Penge, the individual flowers being quite round, pure white, except the oculated eye, height 2 feet. The Evening Primroses, Œnothera riparia and speciosa, are charming plants, the former for the rockery, where its freely produced bright yellow blossoms are most conspicuous. The latter has large pure white flowers growing 2 feet high. The somewhat rare Onosma taurica appears to succeed well, its pure yellow, drop-like flowers are decidedly attractive. Poppies are extensively grown, especially noteworthy being pilosa, a dwarf growing variety with terra cotta coloured flowers

Mr. Ladhams devotes much time to the cultivation of border Pinks, having raised many seedlings, the best of which is Ernest Ladhams, certificated last year. He has crossed some with the ordinary type of Dianthus chinensis in the hope of producing richer colouring. Nelly, a Dianthus chinensis in the hope of producing richer colouring. Nelly, a clearly marked variety, is highly prized. This is one of the most deserving races of plants we have in the hardy plant department, because they come within the range of all persons.—È. MOLYNEUX.

LADY PAGET'S PLEA FOR VEGETARIANISM.

In promulgating the evangel of vegetarianism we shall scarcely be considered as betraying the interests of the readers of this paper. We have, therefore, much pleasure in reproducing from an interview published in the "Westminster Gazette" some of the opinions of Lady Augustus Paget, who throws herself into the cause with that wholeheartedness characteristic of women. Lady Paget is by birth a German, and perhaps much experience of German cookery may have the effect of causing a delicate stomach to incline to the more etherial food of Arcadia. Certainly there are acts entailed by the persistence in a carnivorous diet which shock the humaner sensibilities of the mind when the consideration of these acts is not deliberately ignored. If each of the radiant débutantes at a fashionable ball had helped to kill and cook the viands so delicately proffered to them by their cavaliers in the supper-room, we fancy that the wings of those gentlemen's imaginations would not soar so freely, nor would they accept all the glamour thrown over the function in the columns of the "Lady" or the "Gentlewoman." Romance is, however, a difficult plant to scotch, and thrives even amongst professional cooks and butchers. Such is the inconsistency of the human mind that doctors and nurses have their glorious illusions regarding the patients they are tending, and even the common hangman is capable of falling in love.

Lady Paget was apparently awakened to the general want of logic on the subject of flesh-eating by the description of the cruelties of the trans-Atlantic cattle trade. She overlooks, however, the difficulties which will have to be encountered from the absence of leather and fiddle-strings should the slaughter of animals ever be discontinued in deference to the prejudices of vegetarians. In the course of the interview she says, "I believe that vegetable diet has a decided action upon the mind. In a kind of way it dematerialises the mind. The grosser elements are kept in subjection and the spiritual rises predominant. A person troubled with a torpid mind ought at once to become a vegetarian. I have known many cases where it has been most beneficial. I believe, too, that a vegetable diet enables one to bear hardships and fatigue; this has been demonstrated very forcibly by the long-distance walk from Berlin to Vienna, in which vegetarians have triumphed so gloriously. Since I have abstained from eating flesh food I can climb hills with great ease and never get out of breath. Then, how convenient it is in travelling to be able to make a meal off a piece of bread and an Apple! It renders one so charmingly independent, and lifts a load of care off your mind to have no thought about cooks and hotel dinners. There is another little point, too, which may have great weight with some people -vegetarians have invariably bright, clear complexions; they have no need of cosmetics.

"I cannot emphasise too often that meat diet trammels and materialises our higher faculties. Vegetarians may be eccentric, they may be faddists; but they are invariably gentle, high-minded, well-disposed people. I believe that the practice of vegetarianism will play a most important part in refining the masses and rendering them less coarse and less brutal. In the olden days men ate great lumps of flesh almost raw; now we have developed cooking to an art which has robbed meat of its old repulsive grossness; and, in my opinion, the process of evolution will go on until we come to exclude it altogether from our diet. We are to eat in its place fruits, cereals, vegetables, butter, milk, cream, eggs, cheese, and wholemeal bread. There is one great difficulty in this country—you do not get sufficient fruit ripened in the sun. Look at the Italians; in their sunny clime they live upon fruit; and how healthy they are and how healthy they have been their teeth and a complexity. healthy they are, and how beautiful are their teeth and complexions! I have several little fancies about fruit. It ought to be eaten when freshly gathered, and if possible every person should pick for himself. I never believe that an Apple affords me the same nourishment if it is picked up by the gardener, sorted by the housekeeper, and so passed on to table through many hands. I believe that to get the vital principle of a fruit you must pick it from the tree with your own hands and eat it immediately. Part of its vital essences are lost if it is kept, or if it passes through the hands of others. Fruits are the only edibles we can eat and digest without cooking; everything else requires the aid of fire to make it palatable and wholesome. I believe that the movement in England is much impeded by the inadequate way in which the vegetables are cooked, and until this defect is thoroughly remedied, and a greater variety is introduced into the vegetarian bill of fare, there is not much prospect of extending it amongst the poorer classes, to whom it would be such a great boon.

"My country people, the Germans, are taking up vegetarianism very thoroughly on the ground of health. It was a German professor who first aroused me to interest in the subject, and it has been in German books that I have studied the question. These books are refreshing as mountain air; they are full of cold water, open windows, sun baths, air baths, swimming and gymnastics, everything on the simplest and most economical lines. Their chief object is to bring us back to a healthier and simpler mode of life. The German vegetarian books are full of excellent recipes for dishes of all kinds, suited to every time of the year, and to different countries, which is most important, for the new-fledged vegetarian always thinks he is going to die of hunger. It is certain that the giving up of animal food cures many illnesses which no medicines can touch. In affections of the heart it is often the only remedy. is not difficult to explain, when one reflects that, whilst the meat-eater's heart has seventy-two beats in the minute, the vegetarian's has only fifty-eight beats, being 20,000 beats less in the course of the twenty-four hours. Insomnia and nervousness are affected in the same way—there is less wear and more repose in the constitution. For diseases of the skin a vegetable diet does marvels. I work a good deal amongst the sick poor, and have been most successful in my treatment. I apply the simple remedies, such as nettle tea and camomile tea, and persuade my patients to live on vegetable fare and study ventilation and exercise. always stop their fat bacon. I believe it to be one of the most fruitful

sources of skin disease amongst the poor."

A SUMMER VISIT TO SENNOWE.

This, the beautiful seat of B. Le Neve Foster, Esq., J.P., has been previously alluded to. It is now becoming celebrated on account of the success achieved by the gardener Mr. Gilbert during the past two seasons as a grower and exhibitor of Chrysanthemums. Being in the seasons as a grower and exhibitor of Chrysanthemums. Being in the near neighbourhood a few days since I took the opportunity afforded to

call and see what are the prospects for the coming season.

Some 800 Chrysanthemums are being grown, and judging from present appearances Mr. Gilbert will again occupy an honourable position amongst front rank exhibitors. Most of the best new varieties of the season are included in the collection, and also many seedlings, some of which already show distinct and promising characteristics in habit of growth and in foliage. About fifty plants of the beautiful new white Japanese variety Mrs. B. Le Neve Foster give promise of producing grand flowers. The whole of the plants are remarkable for their dwarf sturdy habit, and the exceptionally stout leathery foliage. The principal distinctive features of the method of cultivation are giving small shifts in potting, so as to ensure eventually the whole ball of soil being well filled with roots; judicious watering, and abstaining from feeding until after the buds are "taken" and commence swelling.

The span-roofed house in which most of the Japanese varieties are

flowered contains trees that are now producing a magnificent crop of Peaches and Nectarines. It is estimated that there are from 1200 to 1300 fruits on the trees. The house is 49 feet long, 16 feet wide, and 10 feet high to the central ridge. Notwithstanding the excessively heavy crop of fruit the trees are developing plenty of good wood for another season's work, showing that their powers are not unduly taxed. It seems to me that the stimulants given to the Chrysanthemums standing thickly together upon the borders in the autumn serve usefully and efficiently to feed the Peach trees also, and this supports the theory that feeding the roots of fruit trees is best effected by supplies of liquid manufactors. by supplies of liquid manure in the autumn and winter.—W. K. W.

CHRYSANTHEMUM PROSPECTS.

In my opinion the Chrysanthemum season will not be a late one. Nearly all my plants showed the crown buds some fourteen days ago, and were not taken. The only variety in my collection that has behaved to me in the ordinary way this season is Boule d'Or (6 feet high); this showed the crown bud on August 5th, which of course I took. Japanese seem to have grown taller than usual. Mdlle. Lacroix is 8 feet high, Florence Davis 7 feet high, Etoile de Lyon 6 feet 6 inches, Gloire du Rocher 7 feet, Stanstead White 6 feet, Sunflower 6 feet, Avalanche 5 feet 6 inches, Viviand Morel 6 feet (after being cut down). In the case of the incurved some have grown exceptionally tall, notably Miss M. A. Haggas, Violet Tomlin, and Princess of Wales, all of which are over 7 feet at the present time. They had a plentiful supply of water during the excessively hot and dry weather. The incurves I have mentioned went 4 feet high before they made a natural break.— F. W. BUCKINGHAM, Tonbridge, Kent.

A SEASON which has thrown the gardening world out of gear must have more or less effect on the Chrysanthemum, and be the cause of corresponding anxiety to exhibitors of the Autumn Queen, emphasised at this crucial period of bud-taking: hence, I take it that notes in the Journal are looked for with more than ordinary interest, though growers in normal seasons to come may regard their notebooks of '93

more as a curiosity than a guide.

Here with 500 plants grown for large flowers, the wood is unusually short-jointed, and the foliage is all that one could desire. The second crown bud is the one I usually go for, but many showed that early in July, and in those cases we are right with a third crown. This obtains with Etoile de Lyon, E. Molyneux, and L. Boehmer, while Avalanche, Mons. Bernard, Mrs. Jameson, Mrs. Clarke, and Col. Smith should be right on the second crown, not yet prominent. Florence Davis, Stanstead White, and some few of Mrs. Hardy are the principal buds taken (on August 3rd) so far. These were pinched plants, and generally difficult to get out in time with us. Amongst incurves, Violet Tomlin, Miss Haggas, Mrs. Heale, and the Princess family generally are not affected by the season, but Jeanne d'Arc is now going for a third bud which I fear will be rather early, and many other incurves will have to be taken on terminals. Robert Cannell and Viviand Morell threw buds at every joint in the spring, and had to be cut to the base. They now have from three to five shoots 2 feet high, and should give a good bud. Amongst the leading varieties in each section some have been stopped or otherwise treated that whatever betides there will be a difference of time of opening in some plants of each variety, and if any lessons are to be learned this year, not the least important may be of having two strings to one's bow.

I trust the Editor will in this department be deluged with copious notes, if only to shut out those belligerent rosarians.—E. K., Dublin.

[We wonder what the rosarians will say about this proposition? We think we can find a fair field for both great floral parties to state their views on matters of current public interest. Let the notes come.]

CHRYSANTHEMUM LEAVES INFESTED WITH EELWORM.

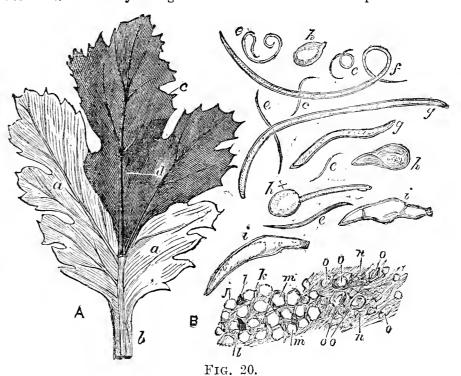

On examining the freshest of the leaves sent by "Chrysanthemum" it had the appearance shown at A, natural size. The lower part a, of the leaf and its footstalk b was found perfectly healthy, the texture thick and leathery, and the epidermis stout and elastic. The upper half c, represented in black, however, was discoloured dark brown or black on the upper surface, and clammy, whilst the under side of that part of the leaf was found to be green and apparently healthy. Tested microscopically, nothing was revealed externally beyond a stunted, swollen, distorted growth of the leaf hairs, on the upper discoloured surface. The stomata on the under side of the discoloured portion of the leaf were swollen, closed, and the hairs mere stumps. There could not be any doubt as to the disease being similar to that produced by water hanging on the leaves for a considerable time. This would have satisfied me at one time (and that not remote) that it was a case of disorganised tissue, the consequence of a bad condition of the soil and roots, but that day has gone for ever.

Taking the finest possible section through a diseased portion of the leaf, as shown by the white line at d, and placing that on edge on a glass slide, I was simply astonished to find an eelworm writhing amid the leaf hairs and forming itself into a "sailor's knot," which has so often been well figured by Mr. G. W. Smith, and others, that it is needless to repeat it here. On subjecting the section to an alcoholic solution the bodies as shown from $e \cdot i$, were disclosed. In e is seen the smaller forms of eelworms present; f, male; g, females; h, cysts or eggs; $h \times$, an undetermined body, probably a female emerging from the egg; i, leaf hairs distorted and broken off in making the section. These last are generally figured as females; such is not the case, but the eelworms probably emerge from the leaves through the leaf hairs, which they evidently convert into galls; anywise they are greatly distorted and

often lie almost flat on the discoloured portion of the leaf, and in the clammy substance among the hairs the eelworm may occasionally be found.

At B is shown a small section of the leaf tissue; j, cells invaded; k, eelworm; l, cysts; m, unattacked cells; n, cells and tissue completely destroyed by eelworms; o, eggs or cysts. The disease first appears as spots, these soon spread over the whole leaf until it withers. The change is more rapid after rain. Excessive wet favours the entrance of the eelworm into the leaf, for I deny that an eelworm can enter a plant by its root hairs, and it takes very little in any other way from the soil. Eelworms are found in root nodosities of Clover, Cucumbers, Melons, Tomatoes, and Vegetable Marrows, but there is no evidence that they can pass from root nodosities through the tissues of the plant to the leaf. That is a phase of the subject which remains as yet unexplained; yet the eelworm gets into the leaves of Carnations somehow, certainly not by the root nodosities, for there are none; nor are there any on Chrysanthemum roots, for they may be and usually are unattacked by eelworm. If the eelworm makes any attempt to ascend the stem internally it must do so by destroying the plant cells, and the stem becomes distorted and clammy externally, and the plants collapse suddenly.

There is no reason culturally for this attack, which is most virulent on the Princess family. Yet the plants are, as shown, infested with the eelworm. The species evidently is a distinct one, closer related to Heterodera radicola, $M\ddot{u}ller$, than to Tylenchus devastatrix, but of this there is doubt, and the leaves were too far gone to render "culture" desirable. The only thing to do with the leaves is to pick off those

diseased and burn them, then spray with Bordeaux mixture. This would prevent any further attack if it did not actually destroy the eelworms in the tissues, for a small portion of copper must be absorbed, and the slightest is fatal to eelworms as well as most other parasites.

Kainit is the only thing likely to benefit the plants at their roots, or a ley formed by steeping wood ashes in water for a few days, then pour off the supernatent liquor and water the plants with it. A quart of wood ashes to a gallon of water, not counting the water necessary to form the ashes into a paste, would be sufficiently strong, but it is more likely the eelworms infest the site upon which the plants are stood rather the soil in the pots. A pinch of kainit between the thumb and two forefingers sprinkled on the surface of each pot and washed in might be of benefit if the eelworms infest the roots. It, however, requires to be used with judgment, taking care not to give an overdose.—G. ABBEY.

IN OTHER LANDS.

A CORRESPONDENT writes:—After reading with pleasure, as I am sure others have done, the interesting notes on "Other Lands" in recent issues of the Journal, I am impelled to send a record of the journeyings of Mr. C. Napier Bell, abridged from a New Zealand paper, "The Christchurch Press," and which appears to well depict the characteristic features of a great and important colony. It is as follows:—

THE FAR WEST OF NEW SOUTH WALES.

Having seen enough of Sydney I took train on the western line in order to take a view of the interior as far as Bourke. Starting from Redfern station, for the first nine or ten miles there is a succession of towns forming the suburbs, these contain handsome houses and fine villas, surrounded with gardens and shade trees, in which one sees a strange mixture of tropical and temperate plants, the beautiful crimson Hibiscus, with Palms of different sorts among Roses, Hawthorn, Elm and Pine trees. At Parramatta is the junction of the line which goes to Newcastle and Brisbane, and beyond this the country is partly cultivated and partly in pasture, being covered with a beautiful sward of

grass; several pretty villages are passed, and the country is watered by many sluggish creeks of dirty brown water. There are also large patches of original bush. Crossing the Nepean river and the Emu Plains, we arrive at the foot of the Blue Mountains, thirty-seven miles from Sydney. The line ascends a spur of the hills, and when the train has climbed some 400 feet high there is a beautiful view of the Emu Plains and the great expanse of level country extending as far as the eye can reach towards the sea. In the distance the country looks as if covered with bush, ridge upon ridge, but near by it is seen to be cultivated and occupied with innumerable orchards of Orange, Lemon, Vines, and fields

of Maize, Lucerne, Sorghum, &c.
At Springwood we are at a height of 1200 feet, and the air is already fresh and cool; this is a pretty township, surrounded with clearings out of the forest, in which Oranges and Lemons are cultivated. As we rush through the woods we see cottages peeping through clearings; small farms here and there with Maize, Potatoes, Pumpkins, Melons, and Oranges, and we pass a picnic party, where hundreds of children are being feasted and amused in a little vale among the bush. At Wentworth Falls we are 2840 feet above the sea; here is a pretty village built on a small flat surrounded with deep gullies, with a fine view over a wooded country. To the south-west appears the town of Lawson, on the same level, two miles off, and a semicircular ridge enclosing a deep wooded valley shows the course the railway takes on top of the ridge from this town to that. Here we see trim orchards of Apricots, Peaches, Apples, &c., and grass fields and cottages all surrounded by the bush, And so on to Katoomba. This is a scattered village built on a commanding ridge jutting out towards the deep valley mentioned above; there are here some very grand hotels, as this is the favourite resort of Sydney people seeking to avoid the heats of summer; the elevation being 3450 feet, the air is delightfully fresh and cool, creeks and running water are seen everywhere, not brown and sluggish, as is usual in Australia; but clear, sparkling, briskly flowing creeks.

Beyond Lithgow we traverse a fine valley partly cultivated and partly covered with good pasture, here we saw very long trains loaded with coal and others with sheep; the valley with its village and cottages, its grassy uplands, gardens, and orchards, surrounded with dark wooded hills, makes a very pretty pass through a wooded, hilly district, and again open out a country of lovely hills and vales, covered with rich pasture and dotted over with scattered trees, making the park-like scenery so characteristic of Australia. Crossing the Macquarrie River we reach the town of Bathurst at 145 miles from Sydney, and 2150 feet This is a beautiful town built on the gently rising slopes above the sea. of the river with fine streets, shops, public buildings, and churches, and scattered all around it are villas, cottages, and mansions, surrounded by beautiful gardens. The valley is seven or eight miles wide, and is bounded by grassy rolling downs. This is a very fertile district. The river winds through this fine valley, its course marked by a Weeping

Willow, Poplar, and native trees.

Passing through fine grassy and cultivated country with several comfortable looking villages, we come to George's Plains, which consist of high wooded ridges, grassy uplands and vales, with a good deal of cultivation round scattered farm cottages. At 8 P.M. we arrive at Orange, 192 miles, and 2840 feet high. This is a flourishing town with several fine streets, in which are some good buildings, fine shops, large hotels, and two or three handsome churches. All the buildings are of brick, as are almost all the towns and villages I have seen in N.S.W. the prettiest country I have seen on this route; round about the town are many cottages and farm houses, and a few villas surrounded with lawns, gardens, and groves of trees. The country has apparently not been long cleared, as the fields are still encumbered with dead ringbarked Gum Trees; the air is deliciously fresh and cool, and the sky without a cloud.

Leaving Orange we pass through many miles of fine country, among orchards and fields of grass, Rape and Lucerne. All along the line within the railway fences there is a brilliant display of Sunflowers and Hollyhocks. We pass ten or twelve miles of dry rocky bush, then come again to park-like glades and rolling land, a sweetly pretty country, in this fresh, cool air and brilliant sunshine.

At Wellington we are getting down to the plains. This is a pretty village of good brick houses and, as usual, surrounded by cottages amidst groves of Acacia and Pepper tree; there are wooded hills surrounding a fine vale of rich grass, with some cultivation in Lucerne and other crops; the soil is dark red and appears very rich. After this we pass over to the Macquarie river, 180 feet wide, with the water standing in pools, separated by sandy beds, and then pass through scattered bush and wide grass fields, in which are many haystacks and a few farm the beautiful sweeping uplands are ploughed, showing the dark red soil, and there are many fine fields of deep green Lucerne. This is a beautiful part of the country, cottages are seen all along with verandahs densely shaded with Vines and Passion-flower; some have walks or bowers leading from the house door to the garden gate, covered over with Vines, and in the gardens are Sunflowers, Hollyhocks, Fig, Quince, Peach, Apricot and Mulberry trees. I saw, also, large patches of Pumpkins, Melons and Maize.

At Murrumbidgerie the monotony of the eternal Gum bush begins to to be relieved by groves of native Pines which grow tall and straight with a conical form like Noah's Ark trees, and this tree is said to indicate good soil, still there is no lack of Gum Trees; in fact, the great Eucalyptus family has taken possession of Australia, and nothing can dislodge it. One often hears of the danger of drought from disforesting a country; but Australia, the land of droughts, is all covered with bush or scrub of one kind or another.

At Dubbo, 278 miles from Sydney and 865 feet above the sea, we are on the great plains of the interior. The temperature is pleasantly warm, the sky is pale blue flecked with clouds, and a balmy breeze tempers the glaring sunshine.

ROYAL HORTICULTURAL SOCIETY.

AUGUST STH.

CONTRARY to expectations the first of the August exhibitions was a large and varied one, the holiday season failing to have the effect generally anticipated. The display was a marked advance on the last one.

FRUIT COMMITTEE.—Present: John Lee, Esq. (in the chair); Messrs. T. J. Saltmarsh. Joseph Cheal, Geo. Bunyard, J. Willard, Geo. Wythes, H. Balderson, F. Lane, George Taber, Jas. Hudson, Rev. W. Wilks

and Dr. Hogg.

Messrs. J. Veitch & Sons sent an admirable collection of hardy fruit comprising Apples, Pears, Plums, Raspberries, and Cherries. The Apples included fine examples of Winter Hawthornden, Frogmore Prolific, Lord Grosvenor, Stirling Castle, Cellini, Lord Suffield, Seaton House, Early Strawberry, and Domino. Amongst the Plums Sultan, Kirke's, Belgian Purple, Belle de Louvaine, and Early Transparent Gage were exceedingly good. A silver Knightian medal was recommended. The Apples, it should be noted, were from pyramids in the open ground. Mr. Nicholas, Castle Hill Gardens, South Molton, received a silver Banksian medal for a group of splendid Pine Apples which aroused the admiration of all present. Numerous Melons were staged. Three received awards of merit, and are referred to below. Messrs. Cheal & Sons, Crawley, sent a large and varied collection of Ornamental Gourds, and a splendid display of Apples, Pears, Crabs, and Plums. The Apples were large, handsome, and excellently coloured, Queen, Gladstone, Lady Sudeley, Peter the Great, and White Astrachan being very fine. There were seventy dishes in all, open ground fruit of the best quality (silver Banksian medal). Mr. Thomas, Royal Gardens, Windsor, contributed an excellent collection of Peaches and Nectarines representing the produce of outdoor trees, also two seedling Melons. The Peaches and Nectarines included Goshawk, Alexandra Noblesse, Stirling Castle, Premier, Violette Hâtive, Grosse Mignonne, Dr. Hogg, A Bec, Bellegarde, Téton de Venus, Pineapple, Elruge, Lord Napier, and many other varieties (silver Banksian medal). Messrs. G. Bunyard & Co. sent Pears Beurré Giffard, Précoce de Trévouf, and Petite Marguerite, also a dish of Lady Sudeley Apple exhibiting remarkably rich colour. The Apples were stated to have been grown in very poor land, and received a cultural commendation.

FLORAL COMMITTEE.—Present: W. Marshall, Esq. (in the chair); Messrs. John Fraser, John Laing, H. Herbst, Richard Dean, George Stevens, C. F. Bause, J. Jennings, H. B. May, Thos. Godfrey, Harry Turner, George Paul, William Bain, Chas. E. Shea, J. T. Bennett Poë, Thos. Baines, Henry Cannell, George Gordon, Peter Barr, and Robert Owen.

Mr. John Forbes, nurseryman, Hawick, Scotland, arranged a magnificent collection of Hollyhocks. Numerous varieties were shown, all the blooms being very double and of excellent shape. Amongst the best may be mentioned Cygnet, Miss Dawson, Walden Queen, Golden Drop, James Macdonald, Alba Superbissima, J. M. Lindsay, Excelsior, Conquest, Mrs. Edgar, Tecoma, Purple Prince and Earl of Breadalbane (silver Flora medal). The same exhibitor also staged Digitalis and Antirrhinums in variety, for which he was accorded a vote of thanks.

An excellent feature of the Show was the collection of hardy flowers staged by Messrs. E. D. Shuttleworth & Co., Peckham Rye, and Fleet, Hants. This exhibit included cut Roses, amongst the best of which were Fisher Holmes, Baroness Rothschild, Ulrich Brunner, Paul Neyron, and Charles Lefebvre. Perennial Phloxes, Gladioli, Lilium superbum, L. longiflorum, L. tigrinum plenum, Rudbeckia californica, Scabiosa caucasica grandiflora, Pentstemons, Asclepias tuberosa and Helenium pumilum (silver Banksian medal). Mr. C. Holden, 61, Warwick Road, pumilum (silver Banksian medal). Mr. C. Holden, 61, Warwick Road, Ealing, exhibited a fine group of foliage and flowering plants, including Coleus Distinction, Begonias, Ferns, Dracænas, and Palms (vote of thanks). Mr. H. J. Jones, Hither Green, Lewisham, sent a basket of Zonal Pelargonium Mrs. Wright, the plants in which were carrying very fine trusses. The same exhibitor also had a basket of Chrysanthamum Lady Fitzgrilliam in grand condition.

themum Lady Fitzwilliam in grand condition.

Mr. J. Hudson, Gunnersbury House Gardens, Acton, showed some magnificently flowered plants of Campanula pyramidalis and C. p. alba. This group produced a fine effect, which was enhanced by the edging of finely grown Aspleniums (silver-gilt Banksian medal). Messrs. Kelway and Son, Langport, Somerset, furnished almost the whole length of one side of the hall with blooms of Gaillardias, the best of which were James Kelway, Topaz, Hero, Oceola, Magenta King, and Splendidissima plena; Eryngium plenum, Helianthus Soleil d'Or, Veronica longifolia subsessilis, Amaryllis belladonna (Belladonna Lily), Achillea eupatoria, Chrysanthemum maximum, Solidago altissima, Delphiniums in variety, Centaurea montana rosea, Helenium pumilum, Dahlia serratipetala Duke of York, and a truly magnificent collection of Gladioli, of which Castro, Countess of Craven, Shakespeare, Duchess of Fife, Besler, Electra, Galatea, Hemon, Baroness Burdett Coutts, Jas. Payne, Mrs. D'Ombrain, Lord Hawke, Duke of Edinburgh, Jas. Wood, Leonard Kelway, Rev. H. H. D'Ombrain, Sir F. Bolton, John Warner, Mariana, Oriana, Duchess of York, Grover Cleveland, Mr. Fowler, J. C. Vaughan, Alfred Henderson, Marengo, and Mary Anderson were particularly striking. Several were honoured by the Committee, and are referred to below. The same firm also showed Cannas in good condition, amongst the best of which were Duke of

York, Comtesse de Morny, and Duchess of York (award of merit, see below). Silver-gilt Banksian medal. Messrs. Hy. Cannell & Son below). Silver-gilt Banksian medal. Messrs. Hy. Cannell & Son arranged a grand collection of double and single Begonias and Antirrhinums. Amongst the best of the double Begonias were Octavie, Mrs. G. Gurney, Sir Cecil Domville, Miss Baldwin, Mrs. Lette, Miss Ada Field, and Sir J. D. Hooker. The single blooms in this exhibit were arranged in sprays, each containing five blooms, and having Maidenhair Fern and Asparagus plumosus as a background, thus producing a novel and striking effect. The same firm also staged Chrysanthemums Golden Shah, Blushing Bride, Harvest Home, and Gustave Grunerwald (silver Flora medal). Messrs. John Laing & Son, Forest Hill, exhibited a group of stove and greenhouse flowering and foliage plants, including Caladiums Mrs. R. Veitch, Baron de Namore, Mercedes d'Argent, President de la Devansaye (award of merit, see below), and Reine de Denmark; Bertolonias Van Houtei, Comte de Kerchove, and Madame A. Van Goert: Caragusta andinalis. Adjentum macrophyllum Madame A. Van Geert; Caraguata cardinalis, Adiantum macrophyllum albo-striatum, Beaufortia speciosa, Saxifraga sarmentosa tricolor superba, Crotons Flamingo and Morti, Fuchsia Countess of Aberdeen, and Grevillea Banksi (first-class certificate, see below). Banksian medal.

Messrs. J. Cheal & Son, Lowfield Nurseries, Crawley, showed a collection of Sweet Peas, double, single and Cactus Dahlias. Amongst the best of the Cactus varieties were Ernest Cannell, Duke of Clarence, Black Prince, and W. Rayner (silver Banksian medal). Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, staged Lilium Batemani, L. Ukeyuri, Cactus Dahlia Ernest Glasse, C. D. Mrs. A. Peart, and Gaillardia Surprise. Mr. C. F. Bause, Morland Nursery, South Norwood, staged Croton Madame Ernest Bergman (see below), Caladium President de la Devansaye (see below), and Dracæna Alexander Laing (see below). Mr. Fred. Bull, Wormingford, Colchester, sent a box of Carnation Golden Nugget. Messrs. Dicksons, Limited. Chester, staged Cockscomb Sunrise. Nugget. Messrs. Dicksons, Limited, Chester, staged Cockscomb Sunrise,

Tropæolum Boule d'Or, Petunia Silver Queen.

Sir Trevor Lawrence, Bart., supported the afternoon meeting with a collection of Cannas, many of the varieties being extremely beautiful. Amongst them may be noted Sophie Buchner, Madame Crozy, Comte de Ganez, Michelet (see awards), Picturata, and Professor David. He also sent a number of Gladiolus Childsi varieties, noteworthy for the great size of the flowers, particularly Seedling No. 1, a huge Allamanda-like bloom. Mr. O'Brien showed Cyrtanthus McKenni, a fragrant little flower not often seen. Messrs. Wallace & Co. sent Lilium auratum Witlei and a variegated Arundo. Messrs. Dobbie & Co., Rothesay, had one of the most pleasing displays in the Show, a large bank of garden Carnations in bunches, and another of Sweet Peas. They had borne their long journey well, being in beautiful condition. Nearly all the best varieties were represented (silver Flora medal). Messrs. Paul and Son The Old Nurseries Charlest 2214 (1997). Son, The Old Nurseries, Cheshunt, contributed a large and beautiful mixed group, comprising Cannas Alphonse Bouvier, Comte de Ganez, Paul Sigrist, Miss S. Hill, and a number of seedlings from the open ground; several boxes of Roses, Begonia Lafayette, Phloxes, Liliums, and other hardy flowers (silver Flora medal). They also had a collection of cut and pot Roses, and two very fine baskets of Clethra speciosa and C. alnifolia. Lord Ashcombe received a cultural commendation for Bignonia grandiflora in splendid condition.

mendation for Bignonia grandiflora in splendid condition.

ORCHID COMMITTEE.—Pesent: Dr. Masters (in the chair); Messrs.

J. O'Brien, H. M. Pollett, T. Statter, Hugh Low, W. H. White, G. Hill,
S. Courtauld, Jas. Douglas. and F. Sander. The duties of the Committee
were light, the exhibits being comparatively few.

Mr. Thorne, gardener to Major Joicey, Sunningdale Park, sent a grand
piece of Vanda Sanderiana with eleven expanded flowers and one bud,
the flowers of great size, exhibiting this fine Orchid in its best character the flowers of great size, exhibiting this fine Orchid in its best character (cultural commendation). Flowers of Cattleya granulosa Scholfieldiana and Miltonia Joiccyana (see certificates) came from the same source. Mr. Stephens, gardener to W. J. Thompson, Esq., Walton Grange, Stone, Staffs, contributed Oncidium spiloptium, bought as O. St. Legerianum, and also a grand variety of Lælia tenebrosa, which is described under and also a grand variety of Lælia tenebrosa, which is described under certificated plants. Mr. Johnson, grower to T. Statter, Esq., Stand Hall, Manchester, was represented by Lælia Schilleriana var. Johnsoni. Messrs. J. Veitch & Sons, Chelsea, sent a new Lælia named Novelty which is referred to below. Earina suaveolens with its deliciously scented spikes came from the Glasnevin Botanical Gardens (botanical certificate).

Sir Trevor Lawrence, Bart., Burford Lodge, Dorking (grower, Mr. White) sent a small but very beautiful group, composed of Aërides Lawrencæ var. Sanderiana with four racemes heavily loaded with bloom, Miltonia spectabilis, Cattleya Blessensis, Lælia elegans Turneri Purple Prince, Lælia Philbrickiana, Schomburgkia Lyonsi, Cypripedium Harrisifroyæ (C. Harrisianum × C. Godefroyæ), C. æno-superbiens (see below), and Aganisia inoptera (botanical certificate). A silver Banksian medal was recommended. Messrs, Sander & Co. also had a very pleasing group, in which Cypripedium hybridum Youngianum, C. Macfarlanei, C. Maynardi, C. radiosum, Grobia Amherstiæ, Vanda Sanderiana, Aërides Ballantinganum aureum a splendid piece of A Sanderiana, Aërides Ballantineanum aureum, a splendid piece of A. Sanderiana, Grammatophyllum Fenzlianum, and Cypripedium Thayerianum (see below) were conspicuous. A silver Banksian medal was recommended. Mr. Chapman, grower to R. J. Measures, Esq., Cambridge Lodge, Camberwell, sent Masdevallia Lowi, which was certificated in 1890, Cypripedium Youngianum, and a form of C. Numa named superba.

CERTIFICATES AND AWARDS.

Melon Hero of Isleworth (Mr. Wythes) .- A cross between Wythes' Seedling and Syon House, a green-fleshed variety, very sweet, neat in shape, and well netted (award of mcrit).

Melon Royal Prince (Mr. W. Palmer, Cobden Villas, Andover) .- A cross between Triumph and Hero of Lockinge, a small evenly netted

yellow-fleshed variety, extremely sugary (award of merit).

Melon County Councillor (Mr. W. Palmer). — A cross between Triumph and Blenheim Orange, a small well-netted variety, sweet in flavour (award of merit).

Tritoma Osiris (Paul & Son, Cheshunt).—Remarkable for its distinct

orange yellow inflorescence (award of mcrit).

Phlox Etna (Paul & Son, Cheshunt).—A brilliant carmine variety

with a good head of bloom, and about 18 inches high (award of merit).

Liatris pycnostachya (Paul & Son, Cheshunt).—Some splendid spikes of this little known old plant were shown, the beautiful mauve heads being greatly admired. It was figured in the Journal of Horticulture some years ago (first-class certificate).

Canna Duchess of York (Kelway & Son).—A beautiful fancy variety,

pale yellow, blotched with deep red (award of merit).

Canna Capitaine de Suzzoni (Lemoine).—A fine variety, with clear yellow blooms profusely spotted with dull brownish red (award of merit).

Canna Gloire d'Empel (Vilmorin).—A grand flower, very rich deep scarlet in colour (award of merit).

Canna Lohengrin (Vilmorin, Andrieux & Co.).—A very distinct colour; it might almost be described as orange amber (award of

Canna Konigin Charlotte (Pfitzer).—A charming flower, with orange scarlet flowers, distinctly margined with clear yellow (award of merit). Canna Michelet (Sir Trevor Lawrence).—A good variety, with rich bright scarlet flowers (award of merit).

Montbretia crocosmæflora plena (Sir Trevor Lawrence).— A semi-double form, having orange yellow flowers (first-class certificate). Hollyhock Amaranth (Webb & Brand).—A rich, deep silvery rose

coloured bloom, of exceptional substance and shape (award of merit).

Gladiolus John Warren (Kelway & Son).—A variety with very large

flowers, and a fine spike, rich orange scarlet, with a few deeper flakes and a purple throat (award of merit).

Gladiolus Grover Cleveland (Kelway & Son).—A very distinct and beautiful variety, brilliant carmine with a faint cerise suffusion, and a white stripe along the centre of each segment (award of merit).

Gladiolus Alfred Henderson (Kelway & Son).—Bright vermilion,

very large flowers and grand spike (award of mcrit).

Gladiolus Duke of York (Kelway & Son).—Light rosy red, throat

pale with purplish flakes (award of merit).

Grevillea Banksi (J. Laing & Sons).—A very distinct and graceful species, of which perhaps the exhibitors will supply some particulars (first-class certificate).

Begonia semperflorens Vernon (J. Laing & Sons).—This bronzy hued variety is now fairly well known. It is a most effective and desirable plant, as much from the fine colour of the leaves as for the profusion of bright red flowers (award of merit).

Caladium President de la Devansaye (J. Laing & Sons and C. Bause). A beautiful variety with rich red foliage (award of merit).

Hedera helix tesselata (Miss Browning-Hall, Algiers).—A tesselated form of the old plant and very attractive (award of merit).

Dracæna Alexander Laing (C. Bause).—A variety with long slender leaves, deep purplish green edged with crimson (award of merit).

Croton Mdmc. Ernest Bergman (C. Bause).—A beautiful variety with

short, broad leaves, elegantly marbled with green, gold, and red (award of merit).

Lælia tenebrosa Walton Grange variety (W. J. Thompson).—A very fine variety, the flowers being of great size, sepals and petals butter yellow, lip white, throat deep crimson, altogether an imposing and beautiful form (first-class certificate).

Miltonia Joiceyana (Major Joicey).—A new form with pseudo-bulbs 4 to 6 inches long, and flowers borne in long racemes. The sepals and petals are dark brown with bars of light brownish yellow, lip very pale mauve, with a darker blotch at the base of the column (first-class certificate).

Lælia Novelty (J. Veitch & Sons).—A hybrid between L. elegans and L. Dayana, the former being the pollen parent. A small form with miniature flattened pseudo-bulbs, sepals and petals rich rosy mauve, lip

very deep rich velvety purplish crimson (award of merit).

Cypripedium ano-superbiens (Sir Trevor Lawrence). — A cross between C. ananthum and C. superbiens, a broad and somewhat impressive flower. The dorsal sepal is of considerable breadth and well rounded. The central area is green with rows of chocolate dots, the margin white with a rosy suffusion; petals broad and blunt, dull reddish brown with a few chocolate spots, lip same colour (award of merit).

Cypripedium Thayerianum (Sander & Co.) —A new hybrid secured by crossing C. Lawrenceanum and C. Boxalli atratum. It is a small very dark flower; lip chocolate with a green base, dorsal sepal dark burnished chocolate with a suffusion of green towards the apex, margin flushed with rose, petals dark chocolate, base greenish and with dark spots (award of merit).

THE LECTURE.

On Tuesday afternoon Mr. J. G. Baker, F.R.S., of Kew, read an excellent paper on Cannas, Mr. Bennett Poë presiding. The essay was essentially botanical, the essayist dissecting the flowers piece by piece and naming every fragment with the ease of a master. These Cannas, said Mr. Baker, were divided into four sections, three of which were so distinct that they had until recently been classed as separate genera, but owing to the ease with which they might be fertilised one with the other it was now generally acknowledged that they were but species of one genus. Cannas were introduced by Gerarde in the year 1596, the species being named indica. The Cannas were first taken in hand by hybridisers in the year 1840, at least it was in the year in which the results were first recorded. The leader in this great work was Mons. Since that year the advance in the quality of Cannas has been

steady throughout the whole of the time.

During the past twenty years the hybridists have, said the essayist, used the true Canna and the well known forms of iridiflora, the objects having been to secure fine bright coloured flowers of large size, and at the same time to retain the handsome characteristics of the foliage. The result of these improvements had been that the old true Cannas have been almost driven out of cultivation, the more showy later hybrids having practically superseded them. A short discussion was afterwards held, in which Mr. G. Paul took a prominent part, and then a vote of thanks having been accorded to Mr. Baker for his interesting discourse the meeting closed.

THE VALUE OF NITROGEN TO PLANTS.

PLANTS can use nitrogen in three different forms--viz.:-

(1), As nitrogen gas or uncombined nitrogen.

(2), In the form of ammonia. In the form of nitrates.

All plants cannot use nitrogen in any of these three forms equally well, but each form is found specially suited to certain kinds of plants, as will be noticed.

(a), NITROGEN GAS USED BY PLANTS.—Although we have nitrogen gas, or uncombined nitrogen, existing in the air in enormous quantities, still, the number and kinds of plants which can use the nitrogen of the air is not large. In general, those plants which are called leguminous, such as the Bean, Pea, Clover, Alfalfa, &c., can take uncombined, nitrogen from the air.

(b), NITROGEN OF AMMONIA USED BY PLANTS.—The leaves of some plants have the power of absorbing ammonia directly from the air and obtain nitrogen in this way. Some plants obtain nitrogen from

ammonium salts through the soil.

e), NITROGEN OF NITRATES USED BY PLANTS.—The largest part of the nitrogen which most plants obtain is taken up by their roots from the soil in the form of nitrates; that is, nitric acid combined with some metal, as sodium or potassium. As already stated, most of the nitrates used by plants are formed by changing into nitrates ammonia compounds and organic substances in the soil by the process called nitrification. Hence, nitrogen, in the form of nitrates, is the most available form for most plants; that is, it can be most readily taken up and used by plants.

RELATIONS OF NITROGEN TO FERTILISERS.

(d), Experiments have shown that nitrogen is essential to the growth of plants; that the quantities of nitrogen available as plant food are very small; that nitrogen is one of the first elements in the soil to be used up; that, of all the fertilising elements, nitrogen is and always has been the most expensive.

THE SPECIFIC ACTION OF NITROGEN UPON PLANTS.

(e), The influence of nitrogen in its various forms upon plant growth

is shown by at least three striking effects.

First.—The growth of stems and leaves is greatly promoted, while that of buds and flowers is retarded. Ordinarily, most plants, at a certain period of growth, cease to produce new branches and foliage, or to increase those already formed, and commence to produce flowers and fruits, whereby the species may be perpetuated. If a plant is provided with as much available nitrogen as it can use just at the time it begins to flower, the formation of flowers may be checked, while the activity of growth is transferred back to and renewed in stems and leaves, which take on a new vigour and multiply with remarkable luxuriance. Should flowers be produced under these circumstances they are sterile and produce no seed.

Second.—The effect of nitrogen upon plants is to deepen the colour of the foliage, which is a sign of increased vegetative activity and

health.

Third.—The effect of nitrogen is to increase in a very marked degree the relative proportion of nitrogen in the plants.

Loss of Nitrogen Compounds.

(f), Since ammonia compounds and nitrates dissolve easily in water, is there not danger of their being carried away in drainage water from

the upper soil out of reach of the plant?

Experiments have been made to settle the question, and results indicate that ammonia compounds are largely retained in the soil. Nitrates are apt to be washed out and lost in the case of bare fallow land; but when the soil is covered with vegetation there is little or no loss, for the reason that the roots of growing plants absorb nitrogen very readily. Some nitrogen is also lost by organic matter in the process of decay, escaping into the air as free nitrogen.

These losses of nitrogen are, to some extent, replaced naturally by means of the nitric acid and ammonia dissolved by the rain and dew, also by organic matter decaying at the surface of the soil, and by conversion of the free nitrogen of the air into some form which the plant can take up and use. These natural additions of nitrogen do not usually make good on the farm the losses, and in time the nitrogen becomes insufficient to produce paying crops without the addition of nitrogenous manures.—N. T. J. (in the "Agricultural Economist.")

HORTICULTURAL SHOWS.

SOUTHAMPTON.—AUGUST 5TH AND 7TH.

For some years past wet weather has characterised the summer Exhibition and Fête held annually under the auspices of the Royal Horticultural Society of Southampton, and the financial results have in consequence not always been of a satisfactory nature. men comprising the Council, however, have never been daunted, and notwithstanding the difficulties they have had to contend with in this respect, have each year managed to provide an Exhibition that is generally considered to be one of the best held in the South of England. That which took place in the grounds of the Society at Westwood Park on the above dates proved no exception to the rule as regards the exhibits. Those who are acquainted with the Great York Gala and the famous Shrewsbury Exhibition may form an idea as to what the Southampton Fête is in the south, although on rather a smaller scale. It is a flower show attended by numerous side attractions, which serve as valuable auxiliaries to the floral portion so far as inducing a large number of visitors is concerned. Fortunately fine weather prevailed on this occasion, and thousands of people visited the grounds.

Regarding the Exhibition, although the entries in some classes were not particularly numerous it was on the whole a grand show. In the

not particularly numerous, it was, on the whole, a grand show. In the opinion of the judges the exhibits were quite up to the standard, and in some instances were exceptionally fine. Specimen plants were exceedingly good despite the fact that such growers as Messrs. Cypher of Cheltenham, and A. Ocock, erstwhile gardener at Handcross Park, have apparently ceased to exhibit at Southampton. The plants shown by Mr. Jennings in the leading class attracted much attention, they being grand examples of cultural skill. The groups, usually a strong feature, were good, and the same may be said of the cut blooms. Fruit and vegetables were excellent, the bunches of Muscat of Alexandria shown by Mr. E. Molyneux being amongst the best we have seen this year. The arrangements were conducted in an efficient manner

by Mr. C. S. Fuidge, the energetic Secretary.

PLANTS AND GROUPS.

The principal class in the open section was for ten stove and greenhouse plants, five to be in bloom, and the remaining foliage specimens. Four exhibitors competed for the substantial prizes offered, and the leading award went to Mr. F. C. Jennings, gardener to W. Garton, Esq., Roselands, Woolston, for splendidly grown plants. Those in flower comprised Stephanotis floribunda, Clerodendron Balfourianum, Statice profusa, Allamanda nobilis and A. Hendersoni, the others including Crotons Warreni and Queen Victoria, well coloured and in exceptionally fine condition. Mr. T. Wilkins, gardener to Lady Theodora Guest, Inwood House, Hensbridge, was second, Bougainvillea glabra, Ixora Williamsi, and Croton Queen Victoria being well shown by this exhibitor. The third prize went to Mr. E. Wills, Shirley, and the fourth to Mr. N. Blandford. Mr. Jennings was again first in the class for six stove and greenhouse plants, showing Croton angustifolium (grand and well coloured), Allamanda nobilis, Dipladenia amabilis, Stephanotis floribunda, Dicksonia antarctica, and Kentia Fosteriana. Mr. W. Peel, gardener to Miss Todd, Sidford Lodge, Shirley, was a good second, Mr, E. Wills being third, and Mr. T. Williams fourth. The last named exhibited a magnificent plant of Cassia corymbosa loaded with blossoms. Mr. T. Hall, gardener to Samuel Montague, Esq., M.P., President of the Society, South Stoneham House, secured the premier award for six miscellancous plants, the best of which were Eucharis amazonica, well flowered; Latania borbonica, Cocos Weddelliana, and Allamanda Hendersoni. The second prize went to Mr. W. Peel for a collection of smaller plants.

The groups were good, and in the leading class the competition was very keen. Mr. Wilkins, however, proved the winner of the principal award, this exhibitor having arranged a charming exhibit. The plants were tastefully put together, and the whole produced a very fine effect. From a groundwork of Adiantum, fresh and green in appearance, rose graceful spikes of Celosias, Francoas, and other flowering plants, these being interspersed with Aralias, Crotons, Dracenas, and Caladiums, all richly coloured. Mr. E. Wills followed closely with a very fine arrangement, the third position being assigned to Mr. E. Carr, gardener to W. A. Gillet, Esq., Fair Oak Lodge, Bishopstoke; and the fourth to Mr. B. Ladhams, Shirley, for a compact state of the fourth to Mr. B. Ladhams, Shirley, for a compact group of miscellaneous plants. For a smaller group Mr. Peel secured the leading position, having a fine collection of plants well arranged. The background was composed of a large Palm and Humea elegans, and amongst the most noticeable plants were Crotons, Caladiums, Dracenas, Liliums, and Alocasias. Mr. T. Hall was second, Messrs. Langston Brothers, Burgess Street, Bassett, being third. Mrs. Kingsburg, Boreis Velley, had the best collection of pursery third. Mrs. Kingsbury, Bevois Valley, had the best collection of nursery stock; Mr. G. Windebank, Bevois Town, being second; and Mr. Ladhams third. In the amateurs' section the groups of plants were also well arranged, the principal prizewinners being Messrs. T. E. Chamberlain, F. M. Vokes, and H. O. Vokes.

Ferns were well shown in the open class. Mr. F. C. Jennings had the best six stove or greenhouse Ferns in Adiantum concinnum,

A. cardiochlæna, A. fragrantissimum, Davallia Mooreana, Microlepia hirta cristata (very fine), and Nephrolepis davallioides furcans. Mr. J. Annys, gardener to the Hon. Mrs. Eliote Yorke, Hamble Cliffe, was second; Mr. W. Peel third; and Mr. W. Carr fourth. Mr. N. Blandford, gardener to Mrs. Haselfoot, Moor Hill, West End, was first with six double Zonal Pelargoniums and the same number of single varieties. Mr. G. Windebank was second in both classes. Coleuses were finely shown, the best plants coming from Mr. T. Hall; Messrs. E. Carr and

J. Evans, gardener to Lady Ashburton, Melchet Court, following in order of their names. Mr. T. Hall secured the premier prize for six Petunias, staging well-grown plants. Mr. G. Busby, gardener to Col. F. Willan, Thorne Hill Park, had the best half dozen hardy Ferns, these including fine specimens of Osmunda regalis cristata, Onoelea sensibilis, Lastrea grandiceps, and Athryium f.-f. Elworthi. The leading award for six plants of Celosia pyramidalis went to Mr. R. West, gardener to H. J. Wigram, Esq., Northlands, Salisbury, Messrs.

E. Wills, and T. Hall following in the order given.

In the class for single specimens of stove or greenhouse plants the competition was very keen, and some grand exhibits were fortheoming. Mr. J. Amys secured the leading position for a plant in flower, staging a magnificent specimen of Allamanda Hendersoni. This was well trained and densely flowered, one of the best plants seen at any exhibition. Mr. Jennings followed, the third award going to Mr. E. Carr, both exhibitors showing Allamanda Hendersoni. Mr. Jennings was first with a single specimen of an ornamental foliage plant, having Croton Williamsi in splendid condition, clean and richly coloured. Mr. W. Peel was second with a grand plant of Croton angustifolium, the third prize going to Mr. J. Evans. Mr. Peel had the best six Mosses in pans. Mr. E. Carr was first with Gloxinias and table plants were best shown by Messes. Wills and Budd. Tuberous Begonias were only fairly good, the awards being taken by Messes. E. Wills, Wilkins, J. Hughes, J. Evans, and E. Carr in the respective classes. Orchids were not numerous nor exceptionally good. Mr. J. Evans was first with a single specimen, showing a form of Lælia purpurata well flowered. The second and third prizes in this class went to Messes. E. Wills and E. Carr, the former having a plant of Calanthe veratrifolia and the latter Lælia purpurata. Mr. N. Blandford gained the premier position with a small collection of Orchids tastefully arranged with Ferns, the other exhibitor being W. A. Gillett, Esq., Fair Oak Lodge.

CUT FLOWERS AND TABLE DECORATIONS.

This section formed an important feature in the Exhibition, and appeared to attract the larger number of visitors. Roses were not extensively shown, as could hardly be expected, but those staged were of excellent quality. Messrs. Keynes, Williams & Co., Salisbury, had a grand box of twenty-four blooms considering the time of year, and for which the first prize was awarded. The best flowers were La France, Alfred Colomb, Lady Mary Fitzwilliam, Horace Vernet, and The Bride. Messrs. Perkins & Co., Coventry, followed with a stand of fresh though smaller blooms. The class for twelve bunches of cut flowers was well contested. Mr. J. Budd, gardener to F. G. Dalgety, Esq., Lockerby Hall, Romsey, was awarded the first prize for a box of blooms tastefully arranged with Fern fronds. The most conspicuous in this stand were Clerodendron fallax, Ixora Williamsi, and Cattleya crispa. Mr. J. Evans was a close second, showing a box of very fine flowers. Mr. B. Ladhams, nurseryman, Shirley, was placed first for twelve varieties of hardy herbaceous cut flowers, Mr. N. Pritchard, Christ Church, following. Both exhibitors staged a bright collection of blooms, which were much admired. Mr. N. Pritchard also had some charming spikes of Gladioli in named varieties. Mr. R. West was third with herbaceous cut flowers. Messrs. Keynes, Williams & Co. were placed first with twelve Dahlias, amongst which R. T. Rawlings, Dazzler, Peacock, Duke of Fife, and Henry Bond were the best. Mr. R. West followed with good flowers, Mr. J. Evans being third. Matters were reversed in the class for Pompon Dahlias, Mr. West being first for twelve blooms, Messrs. Keynes Williams & Co. following. Cut Zonal Pelargoniums were best shown by Mr. N. Blandford in the class for single varieties, and Mr. West had the best double flowers. Mr. W. Batten, Old Basing, secured the leading prizes for six bunches of cut flowers and half a dozen Rose blooms.

The table decorations were simple and effective. For a table 8 feet by 4 feet dressed with flowers and foliage, Mr. Ladhams was placed first for a pretty arrangement, Mr. A. B. Hobby, Vadwell Road, followed in this class. The best epergne of flowers was also staged by Mr. Ladhams, Miss K. Goldring and Mrs. Kingsbury being second and third. Messrs. Perkins & Co., as is usual with them, secured the chief awards for bridal and hand bouquets in the open classes. Baskets of wild flowers and buttonhole bouquets were well shown by Miss K. E. Matthews, Miss Bauce, Miss Ladhams, Miss Chamberlain, Messrs.

B. Ladhams and A. G. Allsop.

FRUIT AND VEGETABLES.

As already remarked, these were well represented, and by some were considered to be the best that have been seen at Southampton. Grapes were splendidly shown in the classes for white and black varicties. Five competed for three bunches of white Grapes, but the Muscat of Alexandrias staged by Mr. E. Molyneux, Swanmore Park, Bishops Waltham, were by far the best. The bunches were large and of a handsome shape, the berries also being very fine, but a week or so would have given them a better tint and more finished appearance. However, they were the best Grapes in the Show, and merited the first prize awarded. Mr. H. W. Ward, Longford Castle, was second, also with Muscat of Alexandria, well finished, but a little smaller in bunch and berry than those exhibited by Mr. Molyneux. Mr. C. Warden, gardener to Sir F. H. Bathhurst, Clarendon Park, Salisbury, was third with fine bunches of Buckland Sweetwater. For three bunches of black Grapes Mr. A. Henbest was placed first for grandly finished Black Hamburghs. Mr. H. W. Ward was again second, and Mr. G. Inglefield, gardener to Sir J. W. Kelk, Bart., Tedworth House, third. Mr. J. Hughes secured the first prize for two bunches of white Grapes, Mr. Evans being second

and Mr. G. W. Taylor third. Four competed in the class for two bunches of black Grapes, and the prizes were taken by Messrs. G. Busby, J. Hughes, and J. Budd. Seven exhibitors competed for a single bunch of white Grapes, and also for one bunch of any black variety. In the former class Mr. E. Molyneux was again first with well finished Muscats, Messrs. H. W. Ward and C. Warden securing second and third prizes respectively. Mr. Henbest had the best single bunch of black Grapes, showing perfectly coloured Black Hamburghs. Mr. Ward followed with good Madresfield Court. Mr. C. Warden being third

followed with good Madresfield Court, Mr. C. Warden being third.

Although surpassed in Grapes, Mr. H. W. Ward secured a wellmerited honour in the class for six dishes of fruit, Pines excluded.
Seven exhibitors were forthcoming, and the competition was very keen.
Mr. Ward had richly coloured Dryden Nectarines, Brunswick Figs, Sea
Eagle Peach, Hero of Lockinge Melons, Muscat of Alexandria and
Black Hamburgh Grapes in excellent condition. Mr. A. J. Allsop was
second, and Mr. G. Sugfield third. The last named exhibitor had the
best half-dozen Peaches, Mr. Ward following with well-grown Sea
Eagle, and Mr. J. Hughes was third. Eight exhibitors competed in the
class just mentioned, and ten had Nectarines. Messrs. H. Drover and
Sons, Hillside Nursery, Ventnor, were placed first for grand fruits of
Pineapple. Mr. J. C. Jennings was seeond with the same variety richly
coloured. Melons were well shown by Messrs. H. W. Ward, C. Warden,
G. Amys, A. Henbest, G. Inglefield, and E. Molyneux, all of whom
secured prizes in two classes in order as their names are given. Mr. G.
Busby won with six dishes of fruit of outdoor growth, staging Morello
Cherries, Jargonelle Pears, Goliath Plums, Royal George Peach, Brown
Turkey Figs, and Irish Peach Apples, all in first-rate condition. Mr. J.
Budd was second, and Mr. A. Henbest, Crawley Court, Winchester,
third.

Vegetables were clean and of first-rate quality considering the exceptionally dry season. Mr. T. Wilkins secured the leading prize offered by Messrs. Sutton & Sons for a collection of vegetables. These comprised New Intermediate Carrots, Ponderosa Tomatoes, Duke of Albany Peas, Satisfaction Potatoes, Rousham Park Onion, and Cauliflowers. Mr. Wilkins also won the chief prize given by Messrs. Webb and Sons for a similar collection. Messrs. Inglefield and J. Hughes were second and third in this class. For the prizes offered for a collection of nine varieties eight exhibitors competed, and in each case the produce was of excellent quality. Mr. T. Wilkins here also maintained his reputation as being a vegetable grower as well as a plantsman by carrying away the first prize, the second and third awards going to Messrs. G. Inglefield and J. Hughes. Peas were well shown by Mr. H. W. Ward, and Beans by Mr. Inglefield. Mr. R. West staged Potatoes and Carrots in grand condition, and Mr. J. Budd was awarded the premier honour for twelve Onions from spring seed. Mr. J. Hughes had the best dozen autumn-sown Onions, staging fine heavy bulbs of Lemon Rocca. Mr. A. Henbest, out of fourteen competitors, secured the first prize for a brace of Cucumbers, showing perfect fruits of Improved Telegraph. Mr. B. Ladhams won with a dish of Tomatoes, Messrs. W. Colton being seeond, and Langston Bros. third, all staging good fruits. Vegetables and fruit were also well staged in the cottagers' classes.

MISCELLANEOUS.

Miscellaneous exhibits were not numerous. Messrs. Keynes, Williams & Co. had a box of Roses and a collection of new and recently introduced Dahlias. Certificates were awarded for Dahlias Valkyrie (Pompon), Ochroleuca, Duke of York, Duchess of Fifc, and Emperor of Germany, the last four being of the Cactus type. Messrs. Perkins & Co. had a new dark Dahlia named Matchless, and Mr. B. Ladhams staged a large collection of cut flowers, bright and interesting. Mrs. Kingsbury had a group of miscellaneous plants, as also had Mr. W. H. Rogers, Red Lodge Nursery, Southampton. Mr. Rogers likewise sent a splendid group of ornamental shrubs in pots.

EARL'S COURT.—AUGUST 9TH.

THE present Show was to consist mainly of flowering and foliage plants, and they were represented in such numbers as to somewhat overcrowd the tent, one or two of the exhibitors having to be content with a very modest amount of room. This was a direct contrast to the last show, when spacing out had to be resorted to. On that occasion Carnations and Picotees should have formed the most prominent feature, and their searcity consequent on the early season left the show somewhat thin. On this occasion hardy flowers were very strongly reprcsented and made a most beautiful display. Both amateurs and professionals showed them exceedingly well. They are not likely to be seen much better at any show this year. The plan of giving prizes for groups as well for the usual collections answered admirably, the competing exhibits being extremely beautiful, not less so certainly than the majority of the groups of greenhouse and stove plants which are seen at shows. The winning one was a very fine piece of work, material and arrangement being alike excellent. There was not much between the other two, but Mr. Such, notwithstanding a preponderance of Gaillaidias, was placed second. Messrs. Paul & Son had some particularly fine bunches in the class for them, and won most decisively. Better are rarely seen, but Mr. Cuthbertson made a wonderfully good display, considering that the flowers had been staged at Leicester before coming to London, and this, be it remembered, after a very long railway journey. Mr. Wythes is not very often found competing, but when he does enter the fray he gives a good account of himself, and on this oceasion he showed indoor and outdoor flowers and iruit very finely.

The open class for a group of flowering and foliage plants brought an

excellent one from Messrs. Laing & Sons, to which the first prize was deservedly awarded. Double and single Begonias, some well-coloured Crotons and Campanula pyramidalis stood out prominently in it, and the arrangement was very good. There was no competition. Mr. Howe, gardener to H. Tate, Esq., Streatham, was unopposed with a group of Crotons and Dracenas, but condition and cleanliness were so satisfactory that the premier award was made. In the amateurs' class for flowering and foliage plants Mr. Wythes, Syon House Gardens, won with a tasteful arrangement which would very well have borne a few more flowers, but the quality of the material was too good to be taken exception to. There was only one group of Liliums, and that came from Slough. Mr. Turner's plants were well flowered, and descreed the first prize.

Messrs. Paul & Sons, The Old Nurseries, Cheshunt, had a beautiful group of hardy flowers, and were placed first. Mr. Such was second, his Gaillardias showing up well. Messrs. Laing & Sons were third. corresponding class for amateurs Mr. Wythes was first, and Mr. Sage, gardener to Earl Dysart, second. Mcssrs. Paul & Son won with twentyfour bunches of hardy flowers, exhibiting material of first-rate quality. Liatris pycnostachya, Rudbeckia purpurea, Malva moschata, the Phloxes, and Montbretia crocosmæflora were very fine. Mr. M. Cuthbertson was second, also with excellent bunches, and Mr. Such third. In the amateurs' class for twelve bunches Mr. A. Newell, gardener to Sir E. Sanders, won with very good clusters. Mr. Sage was a close second, Mr. Wythes third, and Mr. E. Tickner, gardener to J. Watney, Esq., received

a third prize.

There was a class for a collection of hardy fruit (six dishes), and Mr. Wythes won with Morello Cherries—a capital dish—Royal George Peaches, Williams' Bon Chrêtien Pears, Pineapple Nectarines, Worcester Pearmain Apples, and Jefferson Plums. Mr. G. H. Sage was second

with good Jefferson Plums and Mulberries.

The miscellaneous exhibits comprised many which were at the Drill Hall the day before, and altogether formed a very fine feature of the Exhibition. Mr. Cuthbertson of Rothesay had a bright and well diversified collection of hardy flowers, which were wonderfully fresh considering that they had had a very long journey, and been shown at Leicester on Tuesday (silver medal). Mr. Forbes of Hawick had a very beautiful display of Hollyhocks, which are referred to in our report of the R.H.S.; also a fine display of Stocks, Antirrhinums, and Pentstemons. The two last named were very fine (silver-gilt medal). Messrs. Cheal & Son repeated their Drill Hall exhibit of Gourds, fruit, Sweet Peas, and Dahlias, and it attracted, as it deserved, considerable notice (two silver medals). Messrs. Barr & Son had a very large bank of hardy flowers, good material, well arranged (silver medal). A. McMillan had a box of very good Chrysanthemums (silver medal). Messrs. S. Spooner & Sons had some excellent dishes of Apples (silver medal). Mr. A. W. Young sent Gloxinias and Begonias (bronze medal). Messrs. Barron & Sons contributed an interesting collection of tree foliage, but had not room to display them to advantage (silver medal). Mr. J. Walker, Thame, gave a foretaste of the Dahlia season in some splendid Show and Fancy blooms (silver medal). Messrs. Kelway and Son had the grand collection of Gladioli, Gaillardias, and hardy flowers which attracted so much attention at the R.H.S. meeting (silver-gilt medal); and Mr. R. Nicholas had sent on from there his splendid Pine Apples (silver-gilt medal). Messrs. R. Cross & Sons exhibited sprayers and insecticides. Messrs. J. Laing & Son sent several plants for certificate, such as Begonia Vernon, Grevillea Banksi, Caraguata cardinalis, and Carnation Stanstead Beauty, very bright and good. Mr. T. Jannoch was represented by a neat bank of Lilies of the Valley, remarkable for the time of year (silver medal). Mr. T. A. Hester, gardener to W. G. Dawson, Esq., had a good collection of fruit, not for competition, and so had Mr. Rickwood, gardener to the Dowager Lady Freake, and Mr. Hoar, gardener to T. J. Cooper, Esq., each receiving a silver medal. Mr. J. Hudson, The Gardens, Gunnersbury House, had some splendid plants of Campanula pyramidalis. blue and white. Messrs. Paul & Son. Pine Apples (silver-gilt medal). Messrs. R. Cross & Sons exhiof Campanula pyramidalis, blue and white. Messrs. Paul & Son, Cheshunt, had beautiful boxes of Roses, for which a silver medal was awarded; and Miss Lilian Hudson displayed a charming table of floral decorations, receiving a silver-gilt medal.

TRADE CATALOGUES RECEIVED.

Wm. Bull, 536, King's Road, Chelsea, London, S.W.—Tuberous-rooted Plants and Bulbs.

W. Clibran & Son, Oldfield Nurseries, Altrincham.—Bulbs, &c. Dickson & Co., 1, Waterloo Place, Edinburgh.—Catalogue of Flower Roots, &c.

Dickson & Robinson, Manchester.—Catalogue of Bulbs and Roses. W. B. Hartland, Ard-cairn, Cork.—Catalogue of Daffodils.

Hogg & Wood, Coldstream.—Bulbous Roots.

Wm. Paul & Son, Waltham Cross.—Bulbs and Winter Flowers.

J. R. Pearson & Son, Chilwell Nurseries, Nottingham.—Bulbous Plants.

J. Peed & Sons, Roupell Park Nurseries, Norwood Road, S.E.-Bulbous Flower Roots.

William Sydenham, Tamworth, Staffordshire.—List of Fancy Exhibition Pansies.

Jas. Veitch & Sons, Royal Exotic Nursery, Chelsea. - Hyacinths and other Bulbous Roots.

B. S. Williams & Son, Upper Holloway, London. - Descriptive Catalogue of Bulbs, Fruit Trees, Roses, &c.

FRUIT FORCING.

Vines.—Early Houses.—Although the Vines have the wood ripe and some of the foliage is falling, there must not be any attempt at removing it nor to cut the laterals close in, as that would probably cause the principal buds to start. This must be prevented by removing the laterals by degrees and shortening some of the long shoots, reserving, however, some growth above the buds to which the Vines are to be pruned, the final pruning being deferred until the early part of September. Where the Vines are not satisfactory, the old surface soil should be removed and forked from amongst the roots, raising any that are deep and laying them in fresh material nearer the surface. Good calcareous loam or that containing a rather free admixture of small stones and grit, broken up roughly and well compacted about the roots, is the most suitable compost. If it be of a heavy nature add a sixth of old mortar rubbish; if light, a similar proportion of clayey marl, dried and pounded. Crushed or half-inch bones may be used discriminately say a bushel to cartload of loam, and a similar proportion of charcoal, and where the loam is very turfy add 7 lbs. of kainit and 14 lbs. of Thomas's phosphate to each cartload of loam. Give a moderate vertexing and the roots will push appearable adventitions and the roots will push appearable adventitions. watering and the roots will push, especially adventitious ones, from near the collar, into the new soil at once, and the Vines will start freely when the time arrives for doing so. If the drainage is defective and the whole of the soil has to be removed, perform the lifting expeditiously, and if the Vines are weak it is desirable to give a season's rest or crop very moderately.

Midseason Houses.—The Grapes colour rapidly this season, and though not so large in bunch or berry they are of high quality. Red spider has been very troublesome in some cases, but upon the whole Vines have flourished with the extra light and heat, especially Muscat of Alexandria, which has the Grapes better ripened and coloured than for some years past. Where the berries are ripe it will be necessary to employ a slight shade over the roof lights, with a double thickness of herring nets, to prevent black Grapes losing colour, and Foster's Seedling, Buckland Sweetwater, and similar varieties from having the berries browned. This, and some hexagon netting over the ventilators to exclude wasps and flies, will ensure the Grapes keeping in good

condition for a considerable time.

Where the Grapes are ripening copious supplies of water will be necessary; even outside borders may need applications, and the borders can be mulched with an inch or two of short material. If liquid manure is given it should be of a sustaining rather than stimulating nature, and moderate atmospheric moisture will be necessary for the benefit of the foliage. This can be secured by damping surfaces occasionally, and will not do any harm to the Grapes provided the ventilation is free and a circulation of air insured at night. A little fire heat will be advisable in case of dull and damp weather prevailing, but it need not be more than to secure 70° to 75° by day, and 60° to 65° at night, and admit of a circulation of air constantly, as it is stagnant air that conduces to spotting and cracking in the berries. Allow a fair spread of foliage over black Grapes, but keep that of the white varieties rather thin, not

allowing crowding in either case.

Late Houses.—When well grown Lady Downe's has a decided Muscat flavour, which is improved with keeping. This may be effected in any room from which frost and damp are excluded. Mrs. Pince is, perhaps, the worst of all Grapes to finish, and requires a good spread of foliage, with gentle warmth in the hot-water pipes, so as to secure a night temperature of 65°, and 70° to 75° by day, with a little air constantly, continuing this until the berries are thoroughly black and covered with blue bloom. It, however, loses colour quickly after being ripe, and is inclined to shrivel. Continue to afford full supplies of water until the Grapes are well advanced in colour, for most late Grapes take a long time to perfect thoroughly. All are best grown on the extension system. -that is, they require more room and a greater spread of wood. early and close stopping is always detrimental to the well-doing of late Grapes, and a good spread of foliage is essential. The foliage must be Grapes, and a good spread of foliage is essential. The foliage must be fully exposed to light and kept perfectly clean and healthy, some growth being made so as to keep the roots active, and overcropping avoided. The feeding must also commence early and be continued until the berries are at least coloured, not applying substances likely to taint the Grapes. The water will not do any harm if air is admitted freely. Maintain a constant circulation with a gentle warmth in the hot-water pipes to prevent moisture being condensed on the berries. Afford a temperature of 65° at night, 70° to 75° by day artificially, 80° to 90°. through the day from sun, and close sufficiently early to increase to 90° or 95°. Muscat of Alexandria and Canon Hall Muscat should have: 5° more all round.

Late Hamburghs.—These are more forward than usual, and are advanced towards colouring where the houses have been kept open day and night. This procedure should be continued as there is plenty of time to colour and finish these Grapes, and provided they are ripened in September they retain colour much better than those ripened in August. It will be necessary to place some wasp-proof material over the

ventilators, such as hexagon netting, for these insects are very numerous in some localities and voraciously devour the fruit, some before it is well coloured. Bottles half full of sweetened beer should be suspended outside, and bushels of wasps, bluebottle flies, and other predatory pests may be drowned in a short time.

THE KITCHEN GARDEN.

Celery.—Showery weather has been very favourable to the growth of Celery. In some instances, however, the rains have not been sufficiently heavy to well soak the soil close up to the plants, and this should at once be made good by means of the watering pot. Showery weather is the best time for applying liquid manures or for washing in soot and salt. Soot may be very freely dusted along the rows, but salt must be more sparingly used. Both are excellent manures, and good slug deterrents. Exhibition Celery should have a good soaking of liquid manure about once a week, and only a little soil in the form of a topdressing placed about the stems, the blanching being most cleanly effected by means of several folds of brown paper. Do not bind the latter to such an extent as to check the development of the hearts. About one-half of the leaves ought to be enclosed by the paper, and a month is not too much time to allow for perfect blanching.

For ordinary use the blanching may be effected by moulding up. Commence by clearing small leaves and suckers from the plants of white varieties, weeds also being drawn out. Then dress with soot or salt, or the two in mixture, and wash some of this down to the roots the same evening. Next morning chop down some of the soil from the sides, and distribute about 3 inches of this in the trench. While this is being done the outer stalks of the plants should be held or tied well together. In the course of a fortnight or three weeks the hearts will be advanced considerably, and the second moulding up may be given.

Avoid placing too much soil in the trench at one time. The final moulding up should be given about one month before the Celery is

required for use.

Celery Leaf Miner.—In some gardens the Celery is quite clear of this pest, and in others scarcely a leaf is free of them. A close look-out ought always to be kept for the first attack. This season the flies were unusually early at work among the plants, piercing the leaves and depositing the eggs, and unless all the grubs found eating their way between the two skins are destroyed the leaves will present a very ragged appearance. A free use of soot on and about the plants, applied when the leaves are damp, has a deterrent effect upon the newly hatched flies, driving them to seek fresh quarters, while if all the maggots found in the leaves are crushed between the finger and thumb not much harm will result.

Celeriac.—Celeriac, or Turnip-rooted Celery, ought ere this to have been planted on the level, ground previously well manured for and occupied by early Cauliflowers suiting it well without any further preparation beyond a good surface hoeing. What is wanted is a large, quickly grown, Turnip-like root, a firm rich root-run being the most likely to produce these. Keep the plants well supplied with water in dry weather, liquid manure or soot also doing good. The surface of the ground should be kept free of weeds. There should be no moulding up of Celeriac, the root only being eaten either as a vegetable or up of Celeriac, the root only being eaten either as a vegetable or salad.

Winter Spinach.—This crop is of so much importance that more that ordinary pains should be taken in producing it. It thrives best on rather high, free working, fairly rich ground, the plan of growing it on raised Asparagus-like beds answering well where the site is naturally damp and cold. The ground ought to have been manured and dug some time ago, forking it over lightly once since. If lime has not been given to the selected plot during the past five or six years well whiten the surface with newly slaked lime now and lightly stir in prior to sowing the seeds; no lime being needed then apply a dressing of soot. Draw shallow drills from 12 inches to 15 inches asunder. Moisten these drills if at all dry, and then sow the seed thinly. The Victoria or Monstrous Viroflay is the finest of all varieties, and varieties, and the sown a few long rows of either the round-seeded Summer or prickly-seeded Winter Spinach. Another sowing should be made a fortnight or three weeks later.

Late Kidney Beans.—In the autumn a few late Kidney Beans may prove acceptable. The plants are far from being hardy, but if the seeds are sown on somewhat high ground, where the plants can be protected during frosty nights, they may be preserved some time after the rest of either Runner or Kidney Beans have succumbed. Any of the early varieties and also Canadian Wonder are suitable for present sowing. Draw the drills 2 feet as under for the stronger growers, 18 inches being enough for the dwarf early forms, of which Sion House is still one of the best. If the drills are at all dry, water before sowing the seed thinly. Thin out the seedlings to about 6 inches asunder and mould up.

THE FLOWER GARDEN.

Bedding Antirrhinums.—The white bedding variety forms a very attractive bed, the flowering period being fully equal to that of the majority of other plants used. Several newer forms suitable for bedding have also been introduced. In order to have strong plants ready for planting early next season, and which only can be depended upon for a good effect, propagating should commence now. Short flowerless shoots, slipped off from old plants, will root readily in a cold frame or handlights at the foot of a north wall or other cool and not too dark position. Dibble three or four of the cuttings round the sides of 3-inch pots filled with gritty loamy soil, give a gentle watering, and keep close and shaded during the hottest part of the day till they are rooted. Some could be wintered in pots, and the rest planted in sheltered nursery beds.

Antirrhinums from Seed .- The white bedding and other named Antirrhinums come quite true from seed, and this is the readiest means of raising a large number of plants. Now is a better time for sowing than early next year, and this season's seed will germinate more strongly than older seed. Sow the seed thinly on the surface of previously moistened pans of light sandy soil and very lightly cover with fine soil. Cover with a square of glass and either moss or paper, and place in a cool frame or handlight at the foot of a north wall or fence. When the seedlings are large enough prick out in boxes of light soil. Being fairly hardy, some may be planted out in nursery beds and the rest be wintered in a cold frame. wintered in a cold frame.

Pentstemons.—These again are seldom very effective the same season they are propagated, but plants raised now from either cuttings or seed would do remarkably well next summer. Both cuttings and seeds should be treated exactly as advised in the case of Antirrhinums. Where hardier bedding plants are preferred to the more tender kinds, Pentstemons ought certainly to be given a place. Strong old plants are most suited to mixed borders, but late summer or autumn raised plants placed out early into large well prepared beds and lightly staked up would prove quite a feature in the display. A mixture of Pentstemons and Nicotiana affinis is both bold and pleasing. As many as are wanted should be wintered in cold frames or pits, as a very severe winter is sometimes fatal to most of the exposed plants.

Tuberous Begonias.—If short flowerless side shoots of these are made into cuttings dibbled rather thickly in page of bares of fire

made into cuttings, dibbled rather thickly in pans or boxes of fine sandy soil, set in the full sunshine and sheltered from heavy rains, the majority will strike root and form tiny tubers before the tops die down. Left where they are and stored in a dry cellar or shed where severe frosts cannot reach them, these small tubers will winter well and be very handy for bedding next season. Now is also a good time to sow seed with a view to having abundance of small tubers to make an early start with next season. Quite new seed will germinate very quickly and strongly, and this should be preferred, though last season's seed will not fail if sound at the time of sowing. Prepare several pans or boxes, by careful draining and filling up with fine light sandy soil. Make the surface very level and firm, but do not sand over, give a gentle watering, and about one hour later sow the seed thinly, quite on the surface, no covering over being attempted. Place in a cold frame on inverted pans or pots with a view to excluding worms, cover with squares of glass, and shade heavily. The soil must be kept uniformly moist, not by waterings, but rather by partial immersion in a tub or tank of water, the one thing to avoid being the disturbance of the germinating seed. The seedlings will not make much growth, but if undisturbed will form tubers near the size of Radish seed. Such, if kept plump till next March, will be available for growing into strong plants by the time they are wanted for the flower beds.

Chrysanthemums.—If there are any bad failures in the flower garden, and the late hot and dry weather proved very trying in many cases, some of these might be made good by either planting out or transplanting Madame Desgrange and Mrs. Hawkins. Both of these varieties are very sturdy and floriferous this season, and perhaps would do better service in the flower beds than under glass. If planted in a sloping direction, the tops well spread out, and lightly pegged or tied down, either variety would form a good groundwork for a few rather tall Cockscombs. A bed or beds thus filled would rank among the most

attractive feature in a garden.

APIARIAN NOTES.

AT THE MOORS.

Four weeks have passed since our bees were taken to the Heather, but, excepting two days when the sun shone at intervals from fifteen to thirty minutes, it never blessed us with its presence for more than five minutes at a time, dense black clouds with strong winds prevailing through the day, and often the nights were frosty, the grass having more the appearance of Christmas than July and August. Bees are doing no good, but the Heather is not past yet, and with a few fine days the honey might come into it and cheer the desponding hearts of many bee-keepers. Although the experience has been disappointing and provoking, I have had some valuable lessons.

In past years it was puzzling to know the cause of dead bees at the front of many of the hives. Sometimes this arose from fighting, the robbers being attracted by smelling the honey through openings in the hive left for ventilation or being badly made. The real and worst cause, however, is swarming. The bees of one swarm, often with many queens, divide themselves into clusters over a number of hives, and, entering them, slaughtering as often as not takes place; the queens escaping injury cause a swarm to issue and repeat the disaster over other hives. When the bees of a

swarm are well received and the weather is favourable the hives rise greatly in weight. When a stray queen enters another hive and is well received piping begins and continues until one or the other is deposed, or till a swarm issues, consequent of the two queens.

I have been several times asked "if I ever heard a laying queen pipe." I have, but once only, when there were none but herself in the hive. At the present time I have four laying queens piping, answering the call of the usurpers, and one has piped for two weeks. If bee-keepers become impressed with these facts, giving no heed whatever to the advice given on how to prevent swarming, they will find the work more enjoyable as well as profitable. In addition to the above cases, I have three hives that swarmed a month since. I excised all the royal cells at the proper time, yet others were raised and the operation had to be performed a second time, swarming being repeated, the cause in every case being a fertilised queen laying and in the hive at the same time as her rival sisters.—A LANARKSHIRE BEE-KEEPER.

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Border Carnations (Laing & Mather). — The box of blooms arrived as we were preparing for press. We can only say they are bright and beautiful. Lady Nina Balfour, blush pink, shows to advantage in good company by the breadth of petal, while the blooms diffuse refreshing fragrance.

Seedling Violas (W. Reid).—The flowers, as Violas often do, arrived with the petals curled. They appear to lack substance, and we should scarcely think the varieties possess any great commercial value, though others may be raised from them worth exhibiting at one of the leading Pansy and Viola shows.

Plants for Exportation (Quintero).—Fruit trees, Roses, and various kinds of plants are successfully transported over longer voyages than you mention by nurserymen who engage largely in an export trade, and they know the best time to send and the right methods of packing to adopt. A few losses must naturally be expected and duplicate plants ordered accordingly.

Fish Manure (F.C.).—The question you ask scarcely permits of a definite reply. Possibly the raw fish might give the best results in a dry season. We should prefer to invest in chemical manure obtained with the essential elements guaranteed, especially for Tomatoes and Vines. Why not, as you have an opportunity, determine the question by experiment? No other method is so good.

Irish Peach Apple (J. B.).—This Apple is more prone than many others to bear at the end of the branches, and it is not, as a rule, wise to shorten these after a sufficient number have been obtained for forming a bush or tree. Generally pruning should be limited to thinning out the least promising parts now to admit light and air to the remainder and thus improve them for bearing.

Fruit for Profit (An Enthusiast).—The Apple trees should have the ground to themselves as bushes or low standards, and 800 trees per acre is far too many as a permanency. They should be 12 feet apart, and that is 302 trees per acre. The trees of course could be planted in the first instance 6 feet apart, and at the end of six years every other row and tree could be transferred to other ground. Plums may be grown as standards with Gooseberries, Currants, and Raspberries between them, and they will bring in good returns so long as they are worth keeping—say a dozen years—then it is better to rely on the Plums alone. There is every reason to anticipate that the demand for fruit will increase, and first-class Apples are likely to realise a remunerative price for some time to come, but inferior fruit will be a drug in the market. Apples grown on the Paradise stock are usually preferable to those from trees on Crab. The produce per tree and consequently acre

depends on the distance, variety, soil, season, and management, so that no estimate can be given. "Profitable Fruit Growing" may perhaps be useful to you, and may be had from this office for 1s. 3d. by post.

Tomatoes Spotted (A. A. B.).—The specks on the fruit appeared to be caused by the fungus Cladosporium lycopersici, but on examining them we found no fungal bodics, and though the epidermal tissues are destroyed to the extent of the scabs, the cells beneath are large and singularly healthy. You will notice that the extremities of the plants, notably the younger leaves, are yellowish, that spots or blotches appear on the stems and older leaves, especially the leafstalks, and that the evil begins at the extremity of the plant and descends to the roots. The disease is called chlorosis, and is believed to be due to imperfect nutrition. It has been recommended to use dressings containing kainit, nitrate of soda, superphosphate, and iron sulphate, but little benefit has been derived from any of them after the disease has developed, and it is hardly likely that scabbing will be prevented by applications at the roots. We should like to see examples later in the season, with a view to affording further information.

"Blind" Chrysanthemums (W. Wells).—Many hundreds of plants have been injured this year by a small weevil-like creature lurking in the points and piercing the soft portion near the apex, thereby causing distortion and blindness. You appear to have caught the enemy at work, but the specimens you send are larger than any we have seen, and may or may not be a different species. At the present moment we have not examples of both forms for examination. The matter is, however, of small moment in comparison with finding the means of preventing the injury, and we know of more than one large collection of plants saved from "blindness" this year by lightly dressing them twice a week with tobacco powder. This is simple, and has proved effectual. Try it, and let us know the result in your case. We may add that the name of your insect is Systellonotus triguttatus, the winged form being males, the others females, and both, as you have found, remarkably active.

Proposed Vineries on Shale (Pitt Hill).—The shale being of the carboniferous formation, weathers, as you say, into a plastic clay, and naturally produces Heaths and Sedges, but it does not contain anything of a deleterious nature likely to injure Vine roots; indeed, it is doubtful if they would penetrate it. When burned, as you are no doubt aware, it forms excellent material for walks and drives. The bottom of the intended border should slope to a drain, being made firm and even, and that must have proper fall and outlet, which will be easily effected in your case, and will to some extent aërate the border as well as render stagnation from water impossible. This is a vital point, especially if you leave the clay in, which we should do, using 9 inches thickness of brickbats, and over these 3 inches thick of mortar rubbish from an old building, freed of pieces of wood; then the good loam and turf on top, well mixed with such additions of turfy loam as you may command to make a depth of about 30 inches of good soil. It would not be desirable to rely on the shale for drainage.

Insects Infesting Lettuce Roots (R. P.).—The insects belong to the family of aphides, and the group that lacks the two tubes so conspicuous in the others on the hinder segments of the back of the abdomen. There are two species hurtful to Lettuce—Pemphigus fuscifrons and P. lactucarius, the last being usually the more common and destructive, forming the fine cottony filaments secreted from the bodies of the insects, which line the cavities hollowed out of the soil between the roots, more plentifully than the other. It is difficult to propound a preventive, as the attack is not suspected until leaf-flagging indicates injury to the roots. Drenching the ground with soapsuds round the plants is beneficial, especially if half a pint of tobaceo juice is added to 10 gallons of soapsuds. The latter must not contain bleaching powder, but ordinary soapsuds from laundries, containing soap and soda only, are safe. Lime water is also obnoxious to the insects, using 1 lb. of quicklime to 3 gallons of water, stirring well, and then let stand two or three days, in which time pour off the clear water and soak the ground with it. After the Lettuces are cleared off give a good dressing of lime and soot, and dig in with a fork.

Propagating and Wintering Heliotropes (York).—The present is the exact time for establishing a stock of Heliotropes for flower beds next summer. Cuttings strike with great freedom in a close warm frame or case, temperature 60° to 70°. We take them from plants in the bods, choosing well-exposed growths, not too soft nor yet hard, but crisp when cut. The extreme tips are often too soft and are then removed, and if they produce flower buds these are cut off. They are inserted an inch or more apart in a firm layer of sifted sandy soil, surfaced with pure sand, on an unsifted loamy mixture, this a little more than half filling the pots, and the whole well watered before the cuttings are taken. These are made about 3 to 4 inches long, the lower half or a little more divested of leaves, the work of preparation, insertion, and removing them to close quarters being done quickly to avert any flagging of the leaves. A light sprinkling is given to settle the sand round the stems, and the requisite shading and moisture are provided to keep the leaves fresh. In the course of a few days they will remain fresh with less shading, and air and light in gradually increasing quantities must be admitted until the plants will endure full ventilation and bright sun, both of which are essential for hardening their tissues. With plenty of space available in a light house in which a winter temperature of about 55° could be maintained, we should establish a

sufficient number of the young plants separately in 4-inch pots, and these with good attention would be in splendid condition for bedding next season. Failing the requisite space we should insert five cuttings in $3\frac{1}{2}$ -inch pots and expect every one to grow, then winter the plants in these pots. Early in the year we should transfer them without division to $5\frac{1}{2}$ -inch pots, and they would afford abundance of cuttings for striking in heat in the spring, and these would make excellent plants by the end of May. From six pots of cuttings, and with suitable cultural conveniences, 300 plants could easily be raised by the time required for bedding out, and it would be no great task to have twice that number. It is to be remembered that Heliotropes cannot be kept healthy in cold greenhouses from which frost is only just excluded, and the temperature should rarely fall or not long remain below 50° in the winter.

Fungus on Her Majesty Rose (F. J.).—The disease on the Rose shoot is not orange fungus, for that is bright orange. The shoot of Her Majesty Rosc sent by you is infested with the ordinary Rose mildew, and forms a felt-like coat over the young wood, living on the outer surface of the eells of the infested parts. This stage of the fungus is known as Oïdium leucoconium; later, dark brown or black specks appear seated amid the felting and spring from the same arachnoid or web-like mycelium. These bodies are the "fruits" or resting stage of the fungus, and by these the parasite survives from year to year, for the spores of the first stage cannot survive the rigours of a severe winter except under glass, where the resting conceptacles are seldom produced, and the mildew is much easier destroyed or arrested in its growth. But the mildew infesting Roses under glass is a different species, and we should be obliged if anyone noticing blackish and roundish specks among the mildew on Rose trees under glass would forward specimen. The dark speck stage of the fungus on your Rose is scientifically called Sphærotheca pannosa, and in that form the fungus is practically indestructible. Remedial measures must be directed to subduing the mildew in its earliest stages. This Mr. Bardney effected under glass by syringing the trees with a softsoap solution occasionally, and it has been found equally efficacious outdoors. The syringing itself unseats the spores, and the potash of the softsoap destroys the mycelium, and renders the leaves for a time proof against the spores. About 1 oz. of softsoap to a gallon of boiling water, thoroughly dissolving, and when as cool as the hand can be borne in it for a minute, applied with a syringe, is effectual when taken in time, upon the first appearance of the disease. Another good remedy is to slake a pound of fresh quicklime in a copper, adding a pound of flowers of sulphur and a gallon of water, and boil for ten minutes, constantly stirring whilst it is boiling, then allowed to settle; the clear liquid is poured off and placed in a stone bottle, kept well corked in a dark place. The plants should be syringed with a 1 per cent. solution of this preparation—that is, half a pint to six and a quarter gallons of water.

Mealy Bug on Vines (A. J.).—By the means mentioned in our last issue the Grapes may be made passable for table—that is, those not coated with the filthy secretion of the insects and become black with fungus. It would be desirable to facilitate the clearing of the Vines as much as possible, for there is nothing you can well do until the crop is off. Immediately that is effected cut away all the laterals and as much of the young wood as can be spared—that is, shorten the bearing shoots to about six or eight leaves of their base, so that if fresh growth is made the pruning buds will not be started. Burn all the trimmings, and syringe the Vines thoroughly, wetting every part of the house, with a mixture of a wineglassful of petroleum to 4 gallons of water, the oil being forced into the water by driving a syringeful of the mixture into the vessel and the next over the Vines, and so on. The syringing is best done in the evening of a calm day, and the house closed. Repeat every other day for a week twice the following week and once a every other day for a week, twice the following week, and once a week afterwards until the leaves fall, collecting and burning them. Prune as soon as the leaves are all down, and burn the prunings. strip the Vines of any loose bark, not peeling them into the quick, and thoroughly wash with a solution of softsoap, 3 ozs. to a gallon of water, adding one teaspoonful of phenyle, mixing well, applying with a brush, and reaching well into every hole, angle, and erevice, taking care not to damage the buds. Thoroughly cleanse the house, the woodwork and ironwork with water, softsoap, and a brush, the glass with clean water, and limewash the walls. Remove the surface soil, and supply fresh loam in its place. If eare is taken not to introduce plants with mealy bug into the house, or it does not adjoin another in which plants are grown infested with it, we do not think you will be further troubled, but it is a good plan to syringe the house before starting the Vines with the petroleum mixture. If you cannot procure phenyle of a chemist, dissolve 3 ozs. of softsoap in a gallon of boiling water, pour into a 2-gallon stone bottle, add a wineglassful of petroleum, cork and churn, moving up and down or to and fro with the hands for fifteen minutes, then pour out a little and apply as before stated but and but the little and apply as before stated but and but a little and apply as before stated but at the little and apply as before stated but at the little and apply as before stated but at the little and apply as before stated but at the little and apply as before stated but at the little and apply as before stated but at the little and apply as before stated but at the little and apply as before stated but at the little and apply as before stated but at the little apply as the little apply as before stated but at the little apply apply as before stated but at the little apply apply as before stated but at the little apply apply as before stated but at the little apply apply apply apply as before stated but at the little apply app then pour out a little and apply as before stated, but not hotter than the hand can bear.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear sporcs. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (W. A.).—Hæmanthus coccineus.

PLANTS IN POTS.

FARM ORCHARDS.

BARREN TREES.

Why are barren trees so often left uncared for, and old worn-out trees not cut down? Because the orchard has been regarded as a mere adjunct to the homestead, a handy enclosure for calves or a sick horse, or any casual animals—a useful paddock in point of fact, the rent of which is obtained from the grass growing under the trees rather than from the fruit upon them. If proof were wanted that it may be more—very much more than this—we might point to the Kent Cherry orchards, where the grazing is let to the resident tenant, and the fruit crop is sold for the landlord by annual auction to the highest bidder. The Cherry crop is so valuable, that though the land on which the trees grow is let, the right to the fruit is retained by the landlord, just as is the right to minerals. To him often enough the fruit is something like a gold mine. Would that the crop of an ordinary farm orchard

were so regarded by the tenant at whose disposal they are, for then no quarter would be given to barren trees, they would either be rendered fruitful or have to give place to other trees.

But we may be told that barrenness, or in other words crop failure, frequently occurs from the destruction of the blossom. It does, and yet this might often be prevented if only due thought were given to the provision of shelter when the trees are planted. A sheltering belt of Lombardy Poplar mixed with Austrian Pine, with an inner line of Myrobellan Plum is a necessity for every orchard at all exposed to wind from the north-east or south-west. It is these cross winds which play havor with the crop. The first in spring, when its icy breath destroys in a single blast the hope and promise of a year; the last in autumn, when the fruit is swept from the trees on the wings of a furious sou'-wester. Last year we were asked why a certain Apple tree had never had a crop of fruit during the eight years of the farmer's tenancy; yet we were told it was full of blossom every year. The tree was evidently in perfect health and full vigour, and root-pruning was our first thought. But a careful survey of the surroundings showed the possibility of cold cutting winds from the north-east past an angle of the farmhouse right on the tree. Our suggestion of an attempt to break the force of this wind by means of a wall screen during blossom time was acted upon this spring, with the gratifying result of a capital crop of fruit now.

Another cause of crop failure is undoubtedly attributable to the planting of so many sorts of Apple of a shy-fruiting habit, and of Pears unsuitable for the climate. "Fifteen years ago did I plant that Blenheim Pippin," said a worthy farmer to us when we were inspecting his orchard, "and it has never yet had a crop of fruit." Well, it is a grand Apple, and worth waiting a while for, but there is a limit to waiting, very much inside fifteen years; life is too short for that, and we should certainly have shortened the branches and re-grafted that barren tree with one or other of the bold and constant fruiters long ago. Too much stress cannot be placed upon the judicious selection of sorts, in doing this something more is required than the mere sight of a tree heavily laden with fruit. On the day before writing this article we saw three fine standard trees in an old orchard bearing a heavy crop of Blenheim Pippins, and we were told that this was the third consecutive heavy crop they had borne. Yet we dare not recommend it for small orchards, because it is notoriously a slow and often shy bearer, and there are plenty of sorts with as fine if not as handsome fruit which yield early and continuous crops. It is for this all-important reason that preference is given to such sorts for orchard planting as Keswick Codlin, Potts' Seedling, Ecklinville Seedling, Warner's King, Lemon Pippin, Golden Noble, Duchess of Oldenburg, Beauty of Kent, and Bramley's

All worthless sorts, barren or otherwise, should be got rid of, and in making arrangements for replanting at leaf-fall in autumn a few select sorts only should be planted. If the intention is to sell the fruit then about six sorts would be ample, planting several trees of each, and planting so well that there may be no doubt about the future of the trees. We shall probably have something more to say about sorts before planting time.

WORK ON THE HOME FARM.

The cutting of winter Oats and Rye has this year been quickly followed by the general harvest, which has not been seriously hindered by wet weather, though heavy showers of rain have been frequent, as the fresh green herbage of pastures everywhere shows plainly enough. Stubble Turnips, Trifolium incarnatum, and Italian Rye Grass are being sown exceptionally early, and second growths of Clover are much more abundant than the first growth was. Thin crops of late sown Oats had much better be used as green forage, or for silage, than be left late upon the ground to ripen. We have seen some fields of both Oats and Barley where the ripening is so uneven, that among Oats especially there must be a serious loss of corn before the grounds and Barley the grounds are serious loss of corn before the grounds are serious loss of corn before the grounds are serious loss of corn before the grounds. be a serious loss of corn before the crop is saved. It is practically two

crops, and if only required for home use would be turned to best account for silage, but we fear this is too much to hope for where ensilage has never been tried.

Root crops have improved wonderfully during the last two or three weeks. Seed which lay dormant in the soil during the drought sprung into growth of marvellous activity with the first heavy shower, and growth has continued with such rapidity that Mangolds, Swedes, Carrots, and White Turnips have rushed up so quickly that plant-thinning could hardly be got over fast enough. We have seen some thin crops, some half failures, but on the whole the root crop bids fair to be one of much greater abundance than at one time seemed possible. The drought has shown us many weak points in the water storage of several farms. This is an important matter which must have attention this autumn, both for the convenience of tenants and for the actual improvement of property. It is possible to accumulate enough water for summer requirements in most meadows by means of land-drains and ditches, as well as by a regular watercourse. It is simply a matter of soil excavation and in some instances of clay puddling for a dam.

THE FIELD VOLE AND ITS NATURAL ENEMIES.

THE Board of Agriculture, in view of the great injury committed by field voles (often spoken of as mice) in Scotland, have issued extracts from the report of the Committee that was appointed to investigate the subject. Illustrations are given of the short-tailed vole (Arvicola agrestis) and of the long tailed field mouse (Mus sylvaticus), as well as of their natural enemies the short-eared owl, kestrel, sparrowhawk, stoat, and weasel.

The Departmental Committee recommend that strict injunctions should be given by landowners that the birds mentioned should not be destroyed. Their presence in full numbers, though inadequate to avert an outbreak of voles, would undoubtedly tend to mitigate it, and as has been proved in the case of the short-eared owl, they have the faculty of multiplying abnormally in presence of an unusual supply of food. They are, at all events, most useful allies to man in combating attacks of ground vermin.

The Committee deprecate in the strongest manner possible the use of the pole-trap for the capture of hawks. Besides the inhumanity of this device, it is indiscriminate, and harmless owls, kestrels, and buzzards are just as likely to be taken by it as are the more mischievous species.

While admitting that it is hardly reasonable to expect that stoats should be allowed to multiply in game-coverts, or in the vicinity of pheasant coops, the Committee have no hesitation in recommending that weasels, which are persistent mouse hunters, and do little damage to game, should not be molested, at least in moorlands and hill pastures, where they can do little harm and much good.

PAMPHLET ON DOGS .- From Messrs. Spratt & Co., Bermondsey, we have received a copy of a pamphlet written for them by Mr. Gordon Stables, M.D., R.N., entitled "The Dog from Puppyhood to Age." It is excellently illustrated, and lovers of dogs will find in it a vast amount of useful information. The writer is widely known as an authority on this and kindred subjects, and his name may safely be taken as a criterion of merit. The price of the publication is 4d.

REMARKS.

30th.—Rain in small hours; much suushine during the day, but cloudy at times, and a heavy shower at 0.30 P.M.

1st.—Breezy and sunny, with cloudy intervals and occasional spots of rain.
1st.—Alternate cloud and sunshine, the latter greatly preponderating; rain after

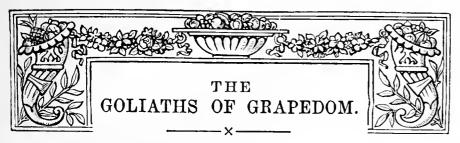

11 P.M.

2nd.—Rain till 4 A.M.; cloudy at times in morning; brilliant afternoon and evening.

3rd.—Generally overcast and windy; occasional gleams of sun; rain at night.

4th.—Rain till 3.3) A.M., then overcast till noon, followed by sunshine till 1.30 P.M.; thunder storms in afternoon with heavy rain 0.48 inch falling in twelve minutes at 3 P.M.

5th.—Brilliant from sunrise to 11.30 A.M., frequently cloudy after.
An unsettled week, with a rather heavy thunderstorm on the 4th. Temperature slightly below the average.—G. J. SYMONS.

T is not for the sake of Biblical comparison that the great Vines to which a passing reference is about to be made are described as the Goliaths of Grapedom. They are not dangerous monsters, calling for destruction from the sling of some horticultural David, but, on the contrary, are looked upon with admiration and pleasure as examples of cultural skill, and of the inherent vigour of the world-renowned fruit. Truly the Vine is a plant of generous strength and large endeavour, loving to stretch its limbs freely, and to forage unrestricted in the earth and in the air Circumstances compel its restriction in many places, but when unfettered and unconfined there are many remarkable examples of its capacities for self-development.

"Men like big things," said the late "Single-handed" in one of those communications which were the delight of Journal readers a few years ago, and in tones of gentle reproach he went on to deprecate the neglect which fell upon many small gems of the flower world through the attention devoted to larger objects. He did not make any direct reference to Vines, and probably did not have them in his mind when penning the lines from which I have. quoted. And indeed there would have been no grounds for using them as another illustration of the accuracy of his observations In the vast majority of cases in which Grapes are cultivated no attempt is made to strive for the production of giants, but rather a restrictive system is pursued in order to provide for the inclusion of a number of varieties, and it is only under exceptional circumstances that huge Vines are grown. Nevertheless, it would be beside the fact to deny that gardeners as a body take a deep interest in every specimen of extraordinary development. The man who only grows table Crotons does not withhold appreciation from 8 feet giants if they are satisfactory in health, cleanliness, and colour; nor does the kitchen gardener, whose Onions are only 8 to 10 ozs. weight, fail to inspect $2\frac{1}{2}$ -lb. examples with admiration when he sees them exhibited. Strange, therefore, would it be if, in the case of a fruit in which so much interest centres as the Grape, special attention were not paid to the wonderful Vines which are dotted here and there over the gardens of the country. They occupy a position which gives them prominence over those that are only of ordinary dimensions. They are, so to say, the reigning family of the Grape nation.

Journal readers have heard something about the great Vines at Manresa House Roehampton, Speddoch, and Cumberland Lodge, and now I should like to say a few words about another giant, not perhaps so remarkable in some respects as they, but still a noble and noteworthy example. This is the Black Hamburgh at Silwood Park, Ascot, the residence of Thomas Cordes, Esq. A recent note from his gardener, Mr. T. Grant, led to a visit, which I considered well repaid by an inspection of what is, without doubt, one of the finest Vines in the country. The respect that is promptly accorded to a man who claims to have read every number of the Journal for a quarter of a century is increased by a survey of the famous Vine under his charge. If any hypercritical person desired further proof of Mr. Grant's intelligence and discrimination than the fact noted, he would find it in a garden that is well managed in every way, and in a Vine that is not only of exceptional dimensions, but is in the best of health, and carrying a splendid crop of fruit.

The Silwood Vine occupies a lean-to house 128 feet long and

No. 686.-Vol. XXVII., THIRD SERIES.

12 feet wide, with a height at the back of 12 feet and at the front of 7 feet. The whole of the roof is covered with rods and laterals. In some respects the Vine resembles and in others differs from that at Roehampton. To begin with, the main stem is a much more prominent feature of it. There is a clear trunk over 6 feet high with a girth at its greatest circumference of 3 feet 2 inches. To imagine an orchard standard of such dimensions is easy enough, but for a Vine it is marvellous indeed. A small boy could have quite a comfortable climb up this wonderful stem, and if left to his own devices after reaching the top would find himself in a happy hunting ground after his own heart. It forks there into two large limbs, these branching in turn into smaller ones, the rods running right and left in a line with the back wall, and the fruiting growths trained from the upper part of them. Here is where the resemblance to the Manresa Vine comes in, for with it the same system is pursued. The laterals of the Silwood Vine, like those of its great rival, are not all trained regularly nearly at right angles with the rods, but many are laid in diagonally.

The Vine is not planted in the centre of the house, but about 70 feet from the door. Seven rods run the length of the house on this side, giving a total of 490 feet, and on the left 9 rods occupy the space, giving a total of 522 feet. Besides these there are young rods laid in, chiefly on the right hand side, where the old ones are thinnest, to the extent of quite 100 feet. The total length of rod may, therefore, be set down at 1112 feet. The foliage is large and healthy; indeed, considering the age of the Vine (about which more further on), the size of the leaves is surprising. And the crop? for after all that is of the greatest importance. It is in every way a fine one. The number of bunches is \$30, ranging in weight from half a pound to 3 lbs. There is a good sprinkling of 2 and 2½ lbs. bunches, and a fair calculation is that the clusters average 14 lb. throughout, or a total of 1037 lbs. in round figures. A noteworthy feature is the large size of the berries. Many of the bunches are quite fit for showing, colour and finish being excellent. It may be noted, too, that the variety is an exceptionally well flavoured one.

It will be conceded that, however the Silwood Vine may compare with the other giants of which we hear and read in dimensions, it would be difficult to find its superior in respect to fruiting. Remarkable indeed is the picture presented by its long lines of bunches, hundred upon hundred stretching overhead. Looking from one end they seem to close up at the other into one broad blue mass of fruit. They are striking to a degree without a doubt, but they open up reflections as to the reverse side of the shield. What a task the thinning of this house alone must be! Every cultural item is carried out as conscientiously with the giant Vine as with others carrying only a dozen bunches. It is in robust, vigorous health, the leaves stout, substantial, and free from insect enemies. The Vine may be pointed to with pride not only for its extraordinary size but for its splendid condition. A unique and interesting comparison could be secured by placing the Chinaman Chang, with his 8 feet 6 inches of stature, beside the huge Vine the next time he visits England. As he is reputed to have strong horticultural tastes he would doubtless enjoy the experience.

Questions may perhaps suggest themselves as to the age of the Vine, the character of the border, and other matters. The age is not definitely known, but is believed to be from 100 to 110 years. If this be so it is quite a veteran compared with the Vine raised and grown by Mr. Davis. Unfortunately, no record of its planting exists. It is true that many cottagers know its history, but unfortunately they all tell a different story, which is rather remarkable considering that there is no doubt in any case that each is telling the whole truth and nothing but the truth about the matter. At least six of them are prepared to swear positively that the Vine was planted by his grandfather—another very remarkable fact. One would think that some of these worthies had been

No. 2342.—Vol. LXXXIX., OLD SERIES.

trained by the continental guides whom Mark Twain has told us about in "The Innocents Abroad," several of whom sold him half of a sacred relic, and others the whole of it. Under the circumstances there is room for reasonable doubt as to the real age of the Vine, and that point must be passed over undecided.

Two facts seem to show that it was first planted in association with others. One of these is that the front wall is built with arches throughout, and the other that the Vine, as already mentioned, is not in the centre of the structure. Probably it originally had companions, and these were removed one by one when it was observed that the Black Hamburgh was bent on developing into something out of the common. It is planted inside, but there is no border either inside or out. Where the roots are feeding no man knows. There are none at the surface. Probably the majority have gone into the lower strata of gravel and sand, and betaken themselves in the direction of the lake which is a considerable distance away. There is a depth of about 4 feet of soil before coming to the gravel. It is light and sandy, but has been rendered more substantial by manurial additions From the front wall of the vinery to a wall opposite there is a distance of 88 feet. This ground was originally not cropped, and the wall left bare, the argument being that the vegetables and fruit trees would rob the Vinc; but as there was a choice assort. ment of Nettles, Docks, &c., when Mr. Grant took charge, and the Vine still lived, he thought he might just as well put in something useful. The walls are now covered with trees, the ground cropped with vegetables, and Tomatoes even grown on the front wall of the vinery. The Vine seems to go on better than ever. The ground has been manured very heavily for the vegetables, and the soil thus enriched, a course which few would find fault with. On another point, however, the present grower comes into direct conflict with the prevailing opinion, and that is in relation to the burying of animal carcases in the border. He believes in it and practises it, except that instead of planting dead donkeys he generally plants dead deer. Instances have been quoted of carcases being buried in borders and years afterwards not a root found near them. This is exactly contrary to the experience of the Silwood gardener. His observation has taught him, he says, that it is quite correct so long as the mass is putrid, but that when quite decomposed the roots do undoubtedly seek and feed upon it.

Somewhat lengthened reference has been made to the Silwood Vine because it has not been previously described, and not because it is advanced as the finest Vine in Britain. There are others which exceed it in dimensions, and which perhaps produce heavier crops. The Manresa Vine, for instance, fills a house 224 feet long and 11 feet wide, and is said to cover 3825 square feet of glass. It has seven rods running parallel with the wall, like the Silwood Vine but their aggregate length considerably exceeds that of the latter amounting to 1400 feet, as against the 1112 feet of the Ascot Goliath. If anything, however, the crop is a little lighter. The Roehampton Vine, which has again been a wonderful sight this year, has carried 706 bunches, weighing 940 lbs., Mr. Cordes' giant producing 1037 lbs., and it may be said that the crop from these two Vines is nearly $17\frac{3}{4}$ cwts. of excellent Grapes. The Manresa Vine is in admirable condition, being vigorous, healthy, and clean, with grand laterals well matured and giving the best promise for another season. Both it and the Silwood Vine are magnificent examples, of which the respective gardeners may be justly proud.

The Vine at Speddoch in Dumfriesshire, which formed the subject of an able communication in the Journal last summer, is another of the Goliaths of Grapedom. It fills a house 60 feet by 20 feet, and is trained vertically instead of horizontally. Its champion made no claim for its supremacy on the score of dimensions, and as he states that its girth at the ground just below its branches is 2 feet 4 inches as against the 3 feet 2 inches of the Silwood Vine, and the house is much smaller than that covering the latter, which in turn is smaller than the Roehampton structure,

such a claim could certainly not be substantiated. When he spoke of its crop, however, he had something quite different to say. The number of bunches was "considerably over 500." This, I might remark in passing, is a somewhat loose statement; surely there was no insuperable obstacle to their being counted. Then we were told that the smallest of them could not be much less than 2 lbs. in weight, while some of the largest weighed 4 or 5 lbs. and upwards. This is very remarkable for a Vine nearly a hundred years old. The total weight in 1891 was "considerably" (vague word) "over 1000 lbs., and it was estimated that the 1892 crop was going to exceed that by 200 lbs. If it did so, if 1200 lbs. of Grapes were actually cut from the Speddoch Vine, then beyond doubt it is more remarkable than either of the others in fruiting, and it must unquestionably be a splendid Vine.

Two other giants of the Grape world are the Cumberland Lodge Vine, which fills a house 138 feet long and 24 feet wide, and the Breadalbane one, which is said to cover 4275 superficial feet of roof space, and may thus be fairly awarded the palm as the largest Vine in the kingdom. I am tempted, in the absence of any personal knowledge of it and its cropping powers, to suggest that a few notes by someone who has seen it and secured statistics would be of great interest to readers of the Journal.—W. P. W.

BAD MELONS.

"IT will soon be time to ask what Melons are grown for," observed one of the judges at a show recently. He was suffering by a surfeit after tasting about twenty fruits, not one of them even second rate in quality and most of them positively offensive. Perhaps the adjudicator was not in the most amiable mood, and he certainly could not judge another class till he banished the horrid "after taste," which made him shudder, by taking a little brandy. Some of the fruits were in a state of semi-fermentation; one seemed to have a paraffin flavour, and the other tasted as if it had been pickled in salt. To say that several were no better than Turnips would be a libel on a good old vegetable. They were not half so pleasant to the taste as a tender slice of a crisp sweet Turnip.

"What are such Melons grown for?" The majority of them could not have been made palatable even with sugar and wine. Perhaps they were grown to "look well" on the table. Three of them were presentable, the remainder miserable enough in appearance; some not half a pound in weight, others innocent of netting; some "pitted" by the nibbling of thrips or other insects that had been trying them. In a word the fruits as a whole were not fit to be seen, could not be eaten, and were entirely out of place on the exhibition

table.

The majority of the fruits appeared to be the produce of starved or exhausted plants, and if foliage had been shown as well as the fruit the former would, perhaps, have been somewhat of a revelation. It is almost certain we should have seen small apologies for leaves, some more than half scorched, others approaching tinder. We might have expected to find hungry colonies of red spider and thrips that had extracted all the sweetness they could from the plants, leaving nothing for the fruits to render them eatable; and it may be that white fleecy masses of mealy bug would not have been absent. It is perfectly certain that no such bad fruits would have been produced by plants carrying stout, clean, healthy green foliage.

Scorching, crowding and starvation ruin Melons and render the fruits of the best varieties worthless. Under good management the plants are kept growing till the fruit is ripe, the leaves being neither specked nor shrivelled, but fresh, firm, and green. Inherently good varieties are then brought out in the highest condition while the fruits of relatively inferior sorts are made the best of, these, let it be said, not being half so bad as the best sorts are under

negligent management or erroneous methods of culture.

Melon growing appears to have come to such a pass that it is hard to find sufficient fruits in a class worthy of the prizes at almost any show. It is almost becoming a surprise, as it certainly is a treat, to find three Melons out of twenty of really first class quality, fleshy, juicy, and refreshing, with a delightful aroma. Is the Melon being spoiled by searchings for improvement and the production of "Heroes" to which some hybridizer hopes to immortalise his name? or is the cultivation—as in the case of Peaches on walls in scores of gardens—becoming a "lost art?" There is something wrong, radically and glaringly wrong, about this Melon question, but whether the fault is to be traced to that ubiquitous

rogue the "weather," to loose methods of culture, or to mongrel

varieties, remains to be discovered and admitted.

So generally low has the average quality of Melons fallen that I think I may challenge any person whose duty it has been to taste, say, a hundred Melons this year for the purpose of awarding prizes, if he can say that he has found ten out of that number worth taking home as a treat to his friends? This was not always so. Melons were even better in the old "dung bed" days than many are now from modern structures. I mean the fruits as represented at exhibitions, for we may hope that high-class Melons are grown which do not find their way to shows. With those we have nothing to do; but exhibited Melons are, for the time being, public property, and sent to be criticised. Under this, in the bulk, they fail. Few, indeed, are really good, some are moderate, and many bad—absolutely bad, and no other word can truthfully express their condition. What are they grown for? To what is this great degeneration to be attributed?—The Other Judge.

THE EARLY HISTORY OF THE PANSY.

WHEN Mr. James Simkins determined to bring out his Pansy book for the encouragement of amateur cultivators, he asked me to write a history of the florists' Pansy from its earliest stage of improvement from the wild Pansy of the field. I did so, to the best of my ability, in the first edition of the work, published in 1889, giving coloured illustrations of some of our first Pansies of more than half a century since. I also wished to place on record the fact that Mr. Thompson, then gardener to Lord Gambier, Iver, near Uxbridge, was the first to take the Pansy in hand, at the instigation of his employer and his daughter, who took to their gardener some plants of the wild Pansy found growing in the fields on the estate.

In a letter from a very able and esteemed correspondent of the Journal received by me, he refers to a conversation betwixt himself and Mr. Sweet, also one of your contributors, to the effect that Mr. Sweet has had conversations with old florists about Kilbarchan as to Pansies being grown in that locality as early as 1812 or 1813, and that the improvement in the Pansy might have been carried on simultaneously in England and Scotland. The date when Mr. Thompson first took the wild Pansy in hand was 1813 or 1814, and those who wish for the information I gave as to its earliest history can find it by referring back to Mr. Simkins's Pansy book, and for a history of the Fancy Pansy to the Journal of Horticulture for July 26th 1883, written by me

of Horticulture for July 26th, 1883, written by me.

In order to try and find out if our Scottish florists really took the Pansy in hand at the time Thompson did, I have searched through volumes of Harrison's "Floricultural Cabinet" from the first volume (1833), and others up to 1840, and although florists' flowers were thoroughly discussed and their treatment and culture given through the "Cabinet," I cannot anywhere find any information as to any Scottish florists having taken them in hand at that early period, or any record of any Scottish-raised varieties.

In the volume for 1833 (December number) coloured illustrations are given of the following Heartsease—viz., Sky Blue and Yellow, in form and size that of a small Viola; Allen's Queen Adelaide, and Appleby's William IV., in which there is the first approach to a "belting" or border on the edge of the three lower petals, but of very indifferent form and with a rayed centre. In the November number of the 1833 volume there is also a coloured plate showing Maid of Athens, Prince George (an exact counterpart of Violas Vernon Lee and Rob Roy), and Thompson's Favourite, a very novel flower, about as well shaped as Viola cornuta and but a trifle larger. Coloured illustrations of these are given in Simkins' book. In this volume there is a list of seventy-six varieties of Pansies in cultivation, the raisers' names so far as given being English florists—Allen, Bryce, Brown of Slough, Bunny of Stratford, Wheeler of Warminster, and Wilmer of Sunbury. Their places of abode are not given, but as I knew all personally in my early days I am able to give their places of business. In this list is to be found Lord Gambier, Thompson's Favourite, already alluded to, and others of Thompson's raising.

In the August number, 1834, there are also coloured plates of Lucy and Sir Walter Scott, the latter a yellow ground flower with dark top petals, with a fraction of belting in each lower petal, and a small blotch on each side of the eye in the side petals, the bottom petal being rayed up to this period. The flower is always alluded to as the Heartsease in the Floricultural Cabinet, but in the volume for 1835 I find the word Pansy first used. This was even then an old name, as Shakespeare makes Ophelia say in her mad scene, "There's Pansies, that's for thoughts," and it is well known that the word is derived from the French Pensée or thought. In this volume are coloured plates of Iver Beauty, golden yellow with a distinct wire edging of cœrulean blue, a flower about the size of

Violetta, the parent of the miniatums, and could it be obtained now would send my esteemed friend William Cuthbertson, of Dobbie & Co., into the regions of delight as an immense acquisition to our Fancy Violas, for I begin to think we shall soon have to make classes for them, selfs, fancies, miniatums, and hybrid Pansies, the latter of the Pansy type, but I am not going into that subject now.

In the 1835 volume there are also coloured illustrations of Royal Crimson, yellow with a margin or belting in the lower petals, with the top petals of brownish crimson, a distinct advance towards our belted show Pansies. Iver Beauty was in all probability one of Thompson's raising. In the same vol., June number, Rollison's Princess Victoria and Marsden's King William are

figured, but still of the Viola form and without blotch.

In the July number, vol. for 1836, an illustration is given of Barratt's Seedling, straw ground colour, with a regular belting and dark top petals, but with a rayed centre, and a nearer approach to our modern show Pansy. Other seedlings figured there also showed improved form with the more distinctive character of the modern show Pansy, and from this time the Pansy went ahead in improved form and size. Mr. Barratt was a well known nurseryman at Wakefield, Yorkshire. He took the Pansy in hand as well as the Dahlia, and his grand old Dahlia Vicar of Wakefield will be remembered by many an old florist.

In June and July, vol. for 1837, eight seedlings raised by the editor, Mr. Harrison, then the proprietor of the Downham Nurseries, Norfolk, are figured, and in some of these this improved form is maintained; but all with one exception with rayed centres—that is, without the defined blotch of dark colcur surrounding the eye—and in that instance the blotch was of very primitive form.

and in that instance the blotch was of very primitive form.

I may add here that in March, 1836, in reply to a correspondent for a list of forty best sorts, Mr. Mountjoy, a celebrated florist at that time near Ealing, London, gave a list which contained twenty-four of his own raising, for he was then celebrated for Pansies, ten of Thompson's raising, and the remainder by other raisers, but not one that I can trace as of Scottish origin.

In the vol. for 1837, in the May No., a brief review is given of "A History and Description of the Pansies Known at that Time," but unfortunately their history is not given in the review in question, but the reviewer stated that at that period there were more than 500 varieties in cultivation; so then as now, far too many must have been sent out as so-called decided improvements.

In the volume for 1840 there is a coloured illustration of Silverlock's Black Knight, a very dark self, which made an immense reputation, for the flower was the first greatly improved dark self known in its fine form, medium size, smoothness and substance. I was at that time in my teens, employed in a nursery in the South of England where we grew every variety of florists' flowers of any note, and I can readily hark back to many of the old Pansies I have enumerated, Silverlock's Black Knight has very often since, and up to the present time, been referred to by me as a grand acquisition in those days. It was introduced by Mr. Silverlock of Chichester, an old and esteemed nurseryman and florist, and the business is still in existence.

The first double Pansy is referred to in this volume, and was raised by an amateur, but in old Parkinson's "Paradisus Terrestris," published in 1629, a double Heartsease is mentioned. In Miller's "Gardeners' Dictionary," 1764, it is stated that "Heartsease or Pansies grow naturally in some parts of the northern counties of England, but are generally cultivated in gardens about

London."

To those who are not well acquainted with Pansies it will be as well to mention that the term "Show" Pansies applies to our old varieties, consisting of white, yellow, or dark selfs of circular form, or to flowers with a white or yellow body or ground colour with dark top petals, a distinct margin or belting in the three lower petals, with a dense well defined blotch about the eye. Fancy Pansies, or those of miscellaneous colours not conforming to the conditions recognised in the old "Show" varieties, but both strains are used for exhibition purposes. — WILLIAM DEAN, Birmingham.

CROWDED FRUIT TREES.

Symmetrical trees, models in shape, are useless unless they produce fine fruit. We are only too familiar with well-shaped trees that are a crowded mass, with not a fruit spur in the centre worthy of the name; they are pruned annually after a fashion, but they might as well be clipped-in with the shears. Trees of whatever description they may be, whether Pears, Apples, or Plums, should have the branches so disposed that light and air can have free-access to every leaf. This is the secret of thorough development, and by no other means can the most satisfactory results be obtained. This is the time to thin out to the desired

extent all overcrowded trees. Whether they are pyramids or bushes the branches should radiate from the stem at distances of not less than 18 inches. This is no waste of space, but on the contrary a gain of fruit, where a common-sense system of pruning is followed.

I have no objection to the fruit spurs advancing somewhat further than some cultivators allow, provided these spurs are judiciously thinned. No harm is done by leaving stubby fruiting shoots from 6 to 9 inches long, if they are shortened after the fruit has been gathered. This style of pruning must be followed if we are to have good crops of such Apples as Irish Peach and Warner's King, which invariably produce bold flowers and fine fruit on those growths; and leaving them will not crowd the trees if the main branches are sufficiently far apart. The chief guide in this matter should be the size to which the foliage attains when, as now, it is fully developed. Warner's King, Betty Geeson, Small's Admirable, and Hanwell Souring (a valuable Apple on the English Paradise stock) make large leaves, and should have more room between their branches than King of the Pippins, Irish Peach, and Cox's Orange Pippin. Exactly the same rule applies to Pears, Cherries, and Plums. The branches of Pitmaston Duchess Pear need more space than those of Winter Nelis; Oullins Golden Gage needs more room than Coe's Golden Drop, and the Bigarreau race than the Duke Cherries.

All who grasp the importance of having the branches of fruit trees a good distance asunder will not allow shoots that extend to be cut out afterwards. This is right, for allowing them to grow to be cut away perhaps two or three years later is so much wasted energy. Fruit trees are often ruined through being allowed to form a strong central lead, depriving other branches of support. If we are to grow fine fruit the heads of standard or bush trees must be kept open, first by the removal of the centre, and then an equal distribution of the branches, so that the lower will have an equal chance with those that naturally assume a more upright position. Small growths and cross branches must be kept out of the trees, so that light and air can reach every part to develop

the buds and colour the fruit.

If we glance at small fruit bushes we find too many of them in a deplorable condition. Gooseberries are allowed to form a thicket near the top, and there is not the slightest chance for fruit spurs to form beneath them. They have been spoiled by overcrowding from youth upwards. By a simple process of allowing main branches to extend a foot or so apart, shortening lateral growths upon them in summer, and cutting those back to two eyes in winter, the branches become clothed with spurs which yield fine fruit abundantly. Similar remarks apply to Red and White Currants. A dozen main branches are ample for producing magnificent bushes, these branches being formed by cutting back the shoots of young trees when planted, and again the second season. After this they may extend, and by summer and winter pruning will become wreathed with fruit. Black Currants are also, as a rule, much too crowded. Old fruiting wood should be cut out now to admit light and air freely to the young and sturdy growths to render them fruitful in character. Raspberries also suffer through a thicket of growths. The canes that have fruited should be removed forthwith, also the young growths thinned and secured against breakage.

Not only are fruit trees growing in the open crowded with wood, but most of those grown against walls have far too many branches or shoots. To allow the leaves to hang one over another is wrong, as they are then either weakened or spoiled, and so must the trees be in no very long time. Healthy fruitful trees and bushes cannot be produced by defective leafage, and where overcrowding is apparent the evil should be rectified at once.-

WM. BARDNEY.

SULPHATE OF COPPER AND PARIS GREEN MIXTURES AS FUNGICIDES AND INSECTICIDES.

WITHIN the recollection of what may be termed experienced cultivators, say of half a century's practice in the agri-horticultural field, the maladies incidental to cultivated plants have increased correspondingly with the enlarged cultures, and proportionate to the spread of commerce—the interchange of seeds, cuttings, and plants between all the countries of the world. Blights, moulds, and rusts are rifer; beetles, moths, and flies have become more numerous, their grubs and caterpillars increasedly vexatious to field and garden crops.

Fifty years ago the Potato disease, caused by the fungus (Phytophthora infestans), was unknown as such in this country, the French and German vineyards had not been materially plagued by Vine mildew (Oïdium Tuckeri), and brown rot (Peronospora viticola) did not greatly devastate European vine-

yards before 1878. Kent was not alarmed by the fungus—the Hop mildew (Spherotheca Castagnei)—before 1843. The Larch fungus (Peziza Willkommi) only became serious on Larches in Great Britain in 1875. Apple scab, caused by the fungus (Cladosporium or Fusicladium dendriticum) and scab, with cracking in Pears, caused by another form of the fungus (C. or F. d. pyrinum), was not noticed as remarkably destructive to the Apple and Pear crops in this country before 1844. The Onion mildew (Peronospora Schleideniana) has only been troublesome to market gardeners and seed growers within the last few years. This plague is believed to have been introduced to the Canary Isles from Bermuda, and found its way to this country by the interchange before alluded to. The "smut" of Wheat (Ustilago segetum) and "bunt" (Tilletia Caries) have not increased for the obvious reason that measures have been taken to prevent their recurrence by steeping the seed in sulphate of copper solutions. This is particularly worthy of the attention of cultivators.

With regard to insects, their increased prevalence is notable. It is right, however, to mention that Mr. T. A. Knight expressed his opinion at the beginning of the century, that insect infestations were oftener the cause of the failure of the fruit crops than were damage from spring frosts. Nevertheless, the caterpillars of the winter moth (Cheimatobia brumata) and other moths have defoliated fruit trees in many places within the last ten years where they were not particularly destructive before. The Hop aphis (Aphis or Phorodon humuli) within the half century has grown in blight to Hops so as to reduce the crop in some years from an average of 7 cwt. to 2 cwt. per acre, but the Hop growers abandoned the predisposed cause—the atmospheric rigmarole, and placed their hopes in science and energy, by which they have or may overcome the enemy. The Turnip fly (Haltica or Phyllotreta nemorum) "eats up" the Turnip crops in some seasons, Miss Ormerod calculating the direct loss caused by this pest in 1881 at more than half a million of money. Gooseberry and Currant sawfly (Nematus ribesi) larvæ, aided by the caterpillars of the magpie moth (Abraxas grossulariata), have maintained their infestations with recurrent virulency. Mustard beetles, the "Black Jack" (Phædon betulæ) had the best of in the Cambridgeshire and Lincolnshire Mustard fields in 1884, and often since. Cob Nut and Filbert trees have been visited in Kent by the larvæ of the March moth (Anisopteryx æscularia), this pest delighting in green Gooseberries and the tender fruits of Apple, Pear, and Plum trees. But the greatest plague of all that I have seen in the half century was that of the Oak leaf roller moth (Tortrix viridina) larvæ in 1888, when they defoliated most of the Oak trees in a wood of 100 acres, and left the garden and orchard fruitless. Rooks were the only benefactors by the invasion, but the cry in 1892 was "still they come"—the multitudinous hosts of caterpillars and in their wake the rooks.

What have the gardeners and farmers of this country done to prevent and repel fungal and insectal invasions? Ever since I can remember the market gardeners of this country collected and strewed road dust on their caterpillar-infested Gooseberry and Currant bushes. That is the foundation of the copper remedies it is mentioned by Herodotus, B.C. 484, as a practice of the Egyptians, but none of our learned scientists took up the subject until our brother cultivators across the Channel - the French vineyardists—used road dust mixed with verdigris to choke off marauders both fungal and insectal. Sulphur proved efficacious against mildew - our recipes for bisulphide of calcium, also sulphide of potassium remedies are due to the French, yet the advent of Peronospora viticola in 1878 caused the French savants to direct their attention to the use of sulphate of copper mixed with road dust, the effect upon the Vines thus treated being more or less satisfactory, and it led to the trial of sulphate of copper in solution as a remedy. M. Prillieux, in 1886, reported to the Société Nationale d'Agriculture de France that "the numerous experiments made that year demonstrated beyond doubt the efficacy of salts of copper in combating the Peronospora of the Vine." M. Prillieux also intimated in 1886 that two or three experiments were made on Potatoes attacked by the Potato mildew (Phytophthora infestans), the results in consequence of the unfavourable conditions not being decisive, but likely to prove effectual. M. Millordet and M. Gayon also pursued the copper remedy with considerable energy, those experts and M. Schlesing having shown that the conidia (the spores) of the Vine mildew did not germinate on leaves treated with a weak sulphate of copper solution, also that the spores of the Peronospora viticola could not or did not grow on the under sides of Vine leaves treated on their upper surface with sulphate of copper. Experiments that were carried out in various parts of France upon M. Prillieux's recommendation have—especially those of M. Aimé Girard in 1888, 1889, and 1890 - proved conclusively that sulphate of copper is as effectual against the Potato mildew as against the brown rot of

the Vine. Similar experiments carried out in Belgium, in America, and at the Cape of Good Hope have, the reports say, been

"favourable without exception."

In 1892 the Board of Agriculture published a "Report on Recent Experiments in Checking Potato Disease in the United Kingdom and Abroad," which has been reviewed favourably in the "Home Farm" part of the Journal of Horticulture. In this "Report" there is considerable difference in the results, some being highly satisfactory, and others "worse than the disease" on account of the damage to the crop and consequent depreciated yield. That is a point we will consider presently, but I wish to impress the fact on those anxious to save their crops from fungal attacks that there is no necessity to smother the leaves of the plants by coating them on their under sides with sulphate of copper. The spores of the Potato fungus enter the Potato leaves mainly by the stomates, therefore it has been concluded that the copper should be mainly placed there. This is a mistake, for M. Schlæsing's experiments show that the copper is retained by the cuticle of the leaves, and its retention by the upper surface of the leaves is sufficient to prevent the fungus from establishing itself upon the under sides, where it first invades the Potato plant, and finally descends to the tubers. This is important, because it renders applications the tubers. made after the disease has been established effective in staying the attack and considerably increasing the crop by preserving the vigour of the plants to a much later period than would be the case were they not treated. Copper, therefore, is a preventive and curative agent in the treatment of the Potato disease.

The reason why some mixtures of copper sulphate have proved innocuous to the foliage of Potatoes, whilst similar have done it considerable injury, is solely due to a proper or improper mixture being employed. If the mixture contains no free copper, and is not too strong, it will not do any harm whatever to the tenderest foliage, but if it comprise the least moiety of free copper it will blacken every leaf it is sprayed upon in degree corresponding to the amount. Chemists are remiss in not telling us all about this; perhaps they think everybody knows as much as they do, or that only they have the right to know anything of the why and wherefore. Every schoolboy will know all about these things shortly. A correspondent last year noted in the Journal of Horticulture that his preparation of Bordeaux mixture was brown in colour, which is not unlikely, as much of the so-called sulphate of copper is largely adulterated with iron sulphate, still he found it efficacious as a fungicide; hence I conclude, rightly or wrongly, that it contained next to none of sulphate of copper, otherwise it is impossible to account for its not laying the plants to which it were applied dead and prostrate, for the brown colour of a copper solution is a clear indication of its not being neutralised by the lime. Chemists have an infallible test for the free copper in a Bordeaux mixture, namely, ferrocyanide of potassium, and it was first mentioned by Dr. G. Patrigeon in the "Journal d'Agriculture," Prat. No. 54, page 701. Half an ounce of ferrocyanide of potassium is dissolved in 2 or 3 ozs. of water, placed in a bottle and kept corked. It is not poisonous, and is a solution of the commonly called "red prussiate of potash." When it is desired to test the Bordeaux mixture for free copper a few drops of this solution is added, and if the mixture contains the least quantity of free copper it immediately gives a brownish reaction. Such mixture is not safe to use upon any plant, for it will blacken Potato tops, Tomato leaves, every thing. If there be no reaction when the ferrocyanide solution is added, the mixture or solution contains no free copper, and is perfectly safe to apply to any plant, provided the dose is not too strong, for another reaction sets in afterwards; therefore, the mixture should not be kept several days, but must be used after it is prepared, according to the formula given, as soon as

The American Bordeaux mixture always differed from the European in containing one-third less lime than of sulphate of copper, whilst the majority of the latter consisted of equal proportions of sulphate of copper and lime, the per-centage being calculated by the sulphate of copper relative to the water used. The bouillie Bordelaise used in the experiments carried on by the Royal Agricultural Society of England for the Board of Agriculture in 1891 consisted of 20 lbs. of sulphate of copper, 10 lbs. of unslaked lime, and 100 gallons of water. M. Girard frequently used a 2 per cent. bouillie—that is, 20 lbs. of sulphate of copper and the same of lime to 100 gallons of water. M. Thienpont thinks a 2 per cent. bouillie better than one of 4 per cent., and strives to hit a happy medium between his and M. Girard's 3 per cent. recommendation by a $2\frac{1}{2}$ per cent. bouillie. M. Petermann tried a 1 per cent. mixture, and recommended a 2 per cent. one. The United States bouillie varied from a 2 to $2\frac{1}{2}$ per cent. of sulphate of copper. All have reference to the Potato disease.—

(To be continued.)

A DOUBLE MONTBRETIA.

MR. W. BAIN, gardener to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, placed a novelty before the Floral Committee of the R.H.S. on August 8th in the form of a double Montbretia croeosmæficra, and its value and distinctness were recognised by a first-class certificate. Sir Trevor had it from the Continent, but Mr. Bain is unable to give any information as to its origin. Strictly speaking the form is semi-double, but the flowers are well filled, and in colour they are bright orange yellow. This promises to be a valuable addition to a useful class of plants. None of the Montbretias at present receives the attention it deserves. M. Pottsi, M. crocosmæflora, and others are

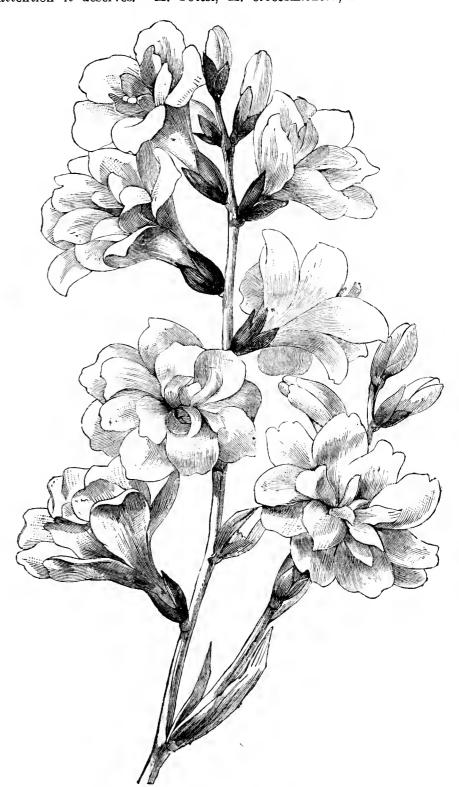

FIG. 21.—MONTBRETIA CROCOSMÆFLORA PLENA.

exceedingly useful from their free flowering nature, their distinct colours, their long period of beauty, and their ease of culture. The new variety which fig. 21 represents will serve a good purpose if it draws wider attention to the whole genus.

CADLAND PARK.

Among the many fine estates that are situated on the shores of the Solent Cadland Park stands out prominently. It is the seat of Andrew Drummond, Esq., of the well-known banking firm at Charing Cross, and is about three miles from the pretty village of Hythe, and seven miles by water and land from Southampton. To reach the mansion and gardens from the southern seaport town is a matter of taste for the visitor. Those who prefer a short but enjoyable sea trip can "cross the stream," as termed by the local "salts," by steamboat in about twenty minutes from Southampton to Hythe, starting from the town quay, which is within a short distance of the railway stations. On a fine

summer's day this is a pleasant ride. The other usual method of reaching Cadland from the point mentioned is by road, which constitutes a drive of at least seventeen miles through a charming district. The estate is a large one, perhaps the finest in that part of the country, and has a sea frontage of thirteen miles. Bordering on the New Forest it is only natural that the scenery is of a picturesque character; but it is almost impossible for anyone who has not seen it to form an adequate idea as to its beauty. It has been my lot to visit numerous parks and gardens from far beyond the borders to the south coast, but in no case have better views presented themselves than on this quiet southern resort. a plainly built though substantial edifice, having been restored in 1837, and is situated on a hill commanding a grand outlook. At the foot of the hill, or rather a series of hills, for the whole neighbourhood is of an undulating nature, lies the Solent, whose waters at the time of my visit were studded with yachts ready for the regatta. On the opposite shore stands the stately Netley Hospital, where thousands of British warriors have been invalided, and near by may be seen Netley Castle nestling amidst a clump of trees. The Hamble Cliffs and hills beyond complete a natural picture that can well hold its own with any in the country.

Time has wrought changes at Cadland Park, as it does elsewhere, and the gardens are now in charge of Mr. G. Garner, whose achievements in the Chrysanthemum world whilst at Amberwood, near Christchurch, are too well known to need further reference here. estimable and able gardener took up his abode here in April last, a busy season, and one generally sufficient to test the abilities of any man. Scarcely had he become settled than the proprietor of the estate, E. A. Drummond, Esq., died, the next heir being his eldest son, as before mentioned. This event, of course, brought slight changes, but the gardens being in excellent keeping are much as heretofore. "Fragrance in flowers and quality in fruit" is the motto at this grand establishment, and Mr. Garner continues to carry it out to a letter. In the houses strict attention is paid to the smallest detail, and as is usual in such cases, fruit of excellent quality is obtained. Peaches under glass are remarkably well grown, and notwithstanding the exceptionally dry season the trees are entirely free from thrips or red spider. This will be all the more astonishing when it is recorded that but little syringing is practised, a cool moist atmosphere obtained by constantly damping the floors being preferred. The Peach and Apricot houses are 270 feet long, lean-to structures, and have a south-eastern aspect. Trees are grown on the back wall and standards in the front, a path being between the two. The standard trees are noticeable for the large number of richly coloured fruit they carry, as well as for the healthy appearance. Of Peaches, Royal George, Sea Eagle, and Hale's Early are favourite varieties; and as regards Nectarines, Rivers' Orange, Improved Downton, Pineapple, and Spencer are most extensively grown. Apricots are trained similarly, there being standards as well as trees on the wall. Moorpark, Hemskirk, Large Red and Early are the favourite varieties. To fill in vacant space between the standard trees in these houses some plants of Sutton's Perfection, Abundance, Excelsior, and Favourite Tomatoes are trained, and these are carrying heavy crops of fine fruit.

Grapes are extensively cultivated, particularly Muscats, but owing to injudicious treatment on some former occasion, the Vines in one house are not in the best of health. To all appearances the Vines are young, are planted in very deep outside and inside borders, and the result is that shanking is prevalent to an undesirable extent. Garner noticed this defect on taking charge last spring, and after a summer's trial he has decided to take out the whole of the Vines in one house devoted to Muscats and plant fresh ones in an inside border of smaller dimensions. By adopting this method success will undoubtedly be ensured. The next vinery is a large one, in which Muscats and Alicantes are planted alternately. The latter are good, the bunches being large, and give promise of colouring well, but it has been decided to partition the structure to grow each kind by itself. It is observable here that a Vine of Muscat of Alexandria planted near a cold-water cistern does not thrive nearly so well as some of its neighbours. house composed of Black Hamburghs the Vines are healthy and bear good bunches of fruit. Some of the rods, however, are rather old, and young ones are being laid in as substitutes. The fourth vinery is also devoted to Muscat of Alexandria. The Vines are remarkably free from red spider and shanking, and moreover are producing a very fine The bunches are large in size and of a handsome shape, the same applying to the berries. Cool treatment is given, air being admitted at night, and obviously with good results. Syringing the Vines is not practised, and despite the prevalence of red spider this season not an insect can be seen on the leaves. If any signs of red spider were seen early in the scason the affected leaves were immediately sponged with softsoap and water, and hence the pest has been kept at bay. cases where shanking has appeared the Vines are induced to make all the growth they possibly can after the first pinching. This plan, evidently a good one, might with advantage be adopted by those who meet with similar difficulties. Melons are splendidly grown in pits as well as in a span-roofed house. In the latter structure the plants are carrying on an average five good fruits each, the varieties including Triumph, Sutton's A1, and Amberwood Beauty, a variety raised by Mr. Garner a few years ago. It is a handsome fruit, the result of a cross between Hero of Lockinge and Read's Scarlet, and ripens about a week carlier than the first-named variety. Cucumbers are also well grown, the plan being to sow the seed where the plants are required to grow. Strawberries are grown in pots, and about 6000 plants are standing in sunny positions to become thoroughly ripened. Contrary to the general rule, they are liberally supplied with liquid manure during the late summer and autumn, none being given in the spring whilst the fruit is ripening.

Hardy fruit forms a feature at Cadland, and at present the trees are carrying enormous crps. Figs in the open air are as plentiful as Apples are in some places, and the fruit ripens beautifully. A "Fig walk" is composed of trees planted against a wall originally, but now they form an arbour over a walk for a distance of 50 yards or so, the branches being supported by stakes. The trees are loaded with fruit of a good size and excellent flavour. Peaches on the open walls were badly blistered last spring, inasmuch as the trees are exposed to east winds. It is therefore proposed to plant choice Pears on this wall, and devote another more favourable to Peaches. This, if carried out, will be a decided improvement, and will result in the production of some fruit of the best quality. Pears on the walls are almost a failure this year, especially old trees, but standards are laden with fruit to such an extent that it has been necessary to support the branches. Marie Louise and Williams' Bon Chrêtien are especially heavy croppers here; no less than 4 bushels of fruit were picked from a medium-sized bush tree of the latter variety. Apples are fairly heavy, and the same may be said in regard to Plums, which are well represented on the walls. Coe's Golden Drop, Green Gage, Rivers' Early, Pond's Seedling, and Magnum Bonum are grown amongst other varieties. Some fine Quince trees are noticeable too, and a grand old Mulberry is producing a fine crop of fruit.

Besides fruit, the usual complement of vegetables and flowers are grown in the kitchen gardens, which are about 5 acres in extent and divided into walled-in sections. These all slope towards the south-east, and the soil being of a light nature, the drought has been severely felt here this summer. By assiduous work and judicious management, however, but few evil effects are now noticeable, and the crops are thriving amazingly. Perhaps one of the most striking features in this department is a row of Scarlet Runner Beans, which forms a division between the kitchen garden and a portion of the pleasure grounds. This row is 372 feet in length, and Beans have, it is stated, been grown in the same position for half a century. The plants this year, notwithstanding the drought, have made free growth and are yielding a good crop of This success is attributed to the fact that apart from the five cartloads of manure that were trenched into the soil in which the beans were planted early in June, copious supplies of water have been given when necessary. The little extra trouble thus involved, however, brought its reward, for whilst many are complaining of a shortness of beans, there is a plentiful supply at this establishment. Large breadths of Broccoli, Cauliflowers, Cabbages, Sprouting Broccoli, and Kale are grown, but no Seakale, inasmuch as abundance of this can be obtained from the seashore a short distance away. Asparagus thrives well and is grown on the level, the soil being as before mentioned light, and therefore suitable for this mode of culture.

In the plant houses the same cleanliness as characterises the outside departments may be observed, and every effort is made to keep up the supply of decorative plants and cut flowers. Near the entrance of the gardens, and close to the gardener's cottage, a large span-roofed greenhouse is situated in which numerous plants are grown. The roof on one side is covered with Jasmines, Heliotropes, Bougainvilleas, and the blue and white Plumbagos, P. capensis alba being especially fine. All these plants are grown similarly to Vines, being "spurred in" closely during This mode of treatment obviously suits them, for they are blossom. Cheshunt Hybrid, Niphetos, Gloire de Dijon, the winter. laden with blossom. Maréchal Niel, and other Roses are trained on the opposite side, and from these thousands of blooms are cut. Zonal Pelargoniums and from these thousands of blooms are cut. Azaleas are extensively cultivated for winter flowering, these plants being special favourites. Orchids find a place amongst the stove plants, and being healthy, will, no doubt, give a profusion of bloom later on. A number of plants of Calanthe vestita, C. Veitchi, and a piece of the beautiful Vanda teres deserves more than a passing notice. Dendrobiums, Lælias, Cœlogynes, Cattleyas, and Odontoglossums are well represented. Chrysanthemums will not be up to the Amberwood standard this year, inasmuch as when the present gardener took them in hand they were still in small pots, the stems nearly 2 feet in height, and growing on a manure bed. The plants were cut back and repotted, and being at the present time in a healthy condition, it is expected that a good supply of blooms suitable for cutting will be forthcoming. Next year we shall doubtless hear further of the Cadland Chrysanthemums, and it may not be too much to expect to see them figuring prominently upon the exhibition tables.

Conifers flourish luxuriantly in the grounds, and also in the extensive woods adjoining. Two remarkably fine Cedars are situated near the front of the house, and there are a few good specimens on the lawn. In a portion of the pleasure grounds near to the kitchen garden there is a splendid tree of the deciduous Cypress (Taxodium distichum), possibly the finest in the country. It is nearly 100 feet in height, and 14 feet in circumference at 4 feet from the ground. The flower garden proper presents a bright appearance, especially some pyramids of Zonal Pelargoniums, which, viewed from one end, appears as a hedge of blossom. Two beds, representing the Prince of Wales' Feathers, are exceedingly well done, one being filled with flowering, and the other with ornamental foliage plants. Beds of sweet-scented flowers are conspicuous, such plants as the Lemon-scented Verbena (Aloysia citriodora), Harrison's Musk, and scented-leaved Pelargoniums being employed. Roses are grown in great numbers, and the same applies to

Lily of the Valley and Carnations, the scented varieties of the last named being preferred. A grand plant, 9 or 10 feet in height, of Chamærops Fortunei, on the lawn, has stood the test of many winters, The broad stretches of green sward are in excellent condition, and the cleanliness which pervades the whole place reflects credit on Mr. Garner and his assistants.—C.

THE SPARROW AGAIN.

SOME few weeks ago we inserted several letters from, we may perhaps be permitted to say, sparrow friends and foes. We could not insert all that came to hand at that time, other subjects demanding a share of space; but as some of the communications were too good to waste they were placed aside till a convenient opportunity offered for their appearance, and now we bring up arrears.

MR. WITHERSPOON is fortunate in having sparrows of a specially good variety. He should do his level best to keep the breed pure, and make his sparrows companions and friends. He should entice them to stop at home by growing corn in a milch state, or he will rue the day when some of his birds go for their holiday, and bring back to their home some of the "scoundrel" kind, which are plentiful over all the horticultural earth.

I have in my garden a wire aviary, which contains, amongst other inhabitants, a white sparrow. The boughs of a Plum tree extend over the wirework of the aviary, and all the blossoms that fall through are eagerly snapped up by this sparrow. If he had his liberty I have not the least doubt but what he would do the same as Mr. Raillem's

sparrows, and might be shot.

Sparrows that have not previously started an establishment of their own feed their young at first on aphides, flies, and caterpillars; but they soon degenerate, and find that their young are quite as easily reared on the soft food provided for young chickens, and with the exception of now and again chasing a white butterfly, give up all the trouble and difficulty of collecting insects of any kind.

On the outskirts of this town (Lewes), and the first year I have ever known such a thing to occur, the jackdaws stripped the Cherry trees of all the fruit; in other years the starling has been the guilty party, and the rooks ate the Green Peas out of the pods in a wholesale way.-

J. H. VERRALL.

THE sparrow is becoming lower in my estimation daily. The rascals were lately caught ruining a row of Sweet Peas by pulling off the flowers. On mentioning this to the owner of the Peas he said, "Yes; they also kill my bees and eat them."

We have had many instances of the injury done by them in this country. Let us have a glimpse over the report of the American Ornithologist to the Department of Agriculture. This is his opinion :-

"The English sparrow (Passer domesticus) is a hardy, prolific, and aggressive bird, possessed of much intelligence and more than ordinary cunning. It is domestic and gregarious in habit, and takes advantage of the protection afforded by the proximity to man, thus escaping nearly all the enemies which check the abundance of our native birds. Its fecundity is amazing; it hatches from five to six broods in a season, with from four to six young in a brood. We take the sparrow as an

"1. The sparrow as an enemy of our native birds. "Of all the native birds which habitually make their homes near the abodes of man, the martin is the only species which is able to hold its own against the sparrows; and numerous instances are on record where even the martin has been beaten and forced to abandon its former nesting place by these belligerent aliens, some of the martins having their eyes picked out. Dr. B. Harry Warren writes:—'Our native birds have rapidly and steadily diminished in numbers since the sparrow came. Former plentiful residents are rare. Even transient visitants and migrants have been so pressed by the usurper that they now seem to avoid certain parts as plague-stricken spots.

"2. The sparrow as an enemy to gardeners and fruit growers.

"In addition to the indirect injury thus brought about by depriving our gardens and orchards of the protection afforded them by our insectivorous birds, the sparrow causes a positive and direct loss to our agricultural industries, amounting in the aggregate to not less than several millions of dollars per annum. The ravages done by the sparrow affect almost every crop produced by the farmer, fruit grower, and gardener, and extend over the entire year. Indeed, it is safe to say that ii now exerts a more marked effect upon the agricultural interest of America than any other species of birds, and its unprecedented increase and spread, taken in connection with the extent of its ravages in certain districts, may be regarded with grave apprehension. In the early spring it prevents the growth of a vast number of fruit by eating the germ from the fruit-buds of trees and bushes. The Peach, Pear, Plum, Cherry, Apple, Apricot, and Currant suffer most. The birds eat Green Peas as fast as they grow. They peck Apples, Peaches, and Grapes, causing them to decay upon the trees. Sparrows are worse than all the Apple

"3. The sparrow as an enemy to Grape culture.

"The Grape industry, which is one of rapidly increasing consequences in America, encounters in the sparrow an enemy second only to the phylloxera and certain fungus growths. Already in some parts of the East it has become such a scourge that Grape culture can no longer be carried on with profit, it being necessary to enclose the ripened clusters in paper bags to insure their protection. They have ruined the Grape crop almost wholly where unprotected.

4. The sparrow as an enemy to grain growers.

"Annoying and injurious as the sparrow is to the fruit grower and vegetable gardener, the loss it inflicts on the producer of cereals is even greater. Though for its permanent residence it prefers populous localities and places of abundant traffic and commotion, still, in anticipation of the harvest season, it gathers in enormous flocks, and leaving the cities and towns, moves off into the surrounding country to feed upon the ripening grain. Its consumption and waste of corn, Wheat, Rye, Oats, Barley, and Buckwheat in many parts of the country is enormous. It feeds upon the kernel when it is in the soft milky state, as well as when it has matured and hardened, and in fields of ripe grain it scatters upon the ground even more than it consumes. Instances have been reported where in the place of a full and fair crop only the straw remained to be gathered.

5. Failure of the sparrow as an insect destroyer.

"The sparrow was brought to America in the belief that it was an insectivorous bird, and with the expectation that it would devour the caterpillars which destroy the foliage of the Elm and other shade trees in the streets and parks. The utter futility of this hope has been demonstrated over and over again in cities and larger towns which are overrun with birds and caterpillars.

"Miss Eleanor A. Ormerod, in her Ninth Report on 'Injurious Insects and Common Farm Pests,' states that the sparrows drive off swallows and martins, thus permitting a great increase in flies and insects destructive in the garden and orchard. Miss Ormerod cites a case in which the destruction of the sparrow and the consequent reappearance of swallows and martins resulted in the abolishment of the insect pest.

"Mr. J. H. Gurney, junr., a well-known ornithologist, says:—1 think the sparrows do enough harm to warrant everybody to destroy them. Say one-fifth of good to four-fifths of harm is about what they do, take the country all over, though at certain times and places they do nothing but harm. I have striven to say what I could in their favour, being

naturally a lover of birds.

The destructive habits of the sparrow in Bermuda, Cuba, England, Germany, Austria, Russia, India, and Egypt, are too well known to require more than passing observations. In England alone the damage it causes has been estimated at not less than 3,850,000 dols. per annum; and in Australia the loss is much greater, as seen in the evidences collected and published by the Australian Government, that in the short space of ten days the sparrows took a ton and a half of Grapes.

What does J. Witherspoon say about these "clouds of witnesses?"-

DAVIES DUFFRYN.

AT page 484 last volume, Mr. Harrison Weir seems to think I regard the sparrow as harmless to the buds of Currants and Gooseberries. It is not the case. I am perfectly cognisant of the mischief they do in that respect; but although I have not observed them destroy Croci, I do not dispute the statements of others on the point. Mr. Harrison Weindoubts if sparrows or other birds will "eat various kinds of caterpillars." Mr. Harrison Weir Here they eat the much-detested Gooseberry caterpillar, which few birds touch, as well as the leaf rollers and other sorts. If I read and interpret his article correctly in regard to the feeding of birds, hc agrees with me on a very important point in the discussion. I know of many of the good and bad habits of the sparrow. My object in taking up the subject was to learn from others whether the good did not counterbalance the evil hc is guilty of .-- W. J. B.

MAN as the lord of creation was told to replenish the carth and subdue it, also to have dominion amongst other things over the fowls of the air. If we remember those two words "replenish" and "subduc," we shall find in them authority to remove whatever may stand in the way of man's progress in the march of civilisation, including sparrows. Fifty years ago there were more birds of prey than now to keep them in subjection.—WILLIAM SMITH.

PLATYCODON OR CAMPANULA.

THE note by "A. D." in the Journal of Horticulture of August 3rd, page 102, on these plants, and the excellent illustration on page 103, under the name of Campanula grandiflora Maricsi, lends emphasis to the remark of your correspondent, "Not very appreciable, if indeed is there any distinction between the Platycodons and Campanula grandiflora and its varieties. Possibly the distinction is found only in name, and if there be none, then the diverse appellations are misleading."

P. grandiflorum and C. grandiflora are synonymous, and much confusion is caused by the use of both names. Alphonse de Candolle is the authority for the genus Platycodon, the name of which is derived from platys, broad, and hodon, a bell, on account of the shape of the flowers. I am not acquainted with the reasons which induced De Candolle to separate the Platycodons from the Campanulas; but the most distinctive feature from the garden point of view is the inflated appearance and flattened top (I mean flat relatively to the other Campanulas) of the Platycodons. This has given rise to the popular name of "Balloon Flower." The only advantage from a flower grower's standpoint of a separation of the plants is that it is difficult to persuade the public that Campanula grandis and C. grandiflora are distinct plants in every way.

Referring to C. grandiflora Mariesi, it may be of interest to add that this beautiful variety was introduced by Mr. Maries, a brother of the nurseryman of that name at Lytham in Lancashire; and that a pure white form identical with it except in colour has been raised in Italy, and was offered for sale this year. I am not aware, however, that it has been offered by any of our British nurserymen. A white form should be of much value and beauty, and it is to be hoped that it will not be long absent from our gardens.—S. Arnott.

[Mr. E. Molyneux refers to a pure white form of Japanese, not Italian origin, on page 127, but describes the plant as growing nearly 2 feet high. Mr. George Paul's plant was quite dwarf, about 6 inches in height.]

KNOWSLEY HALL.

Knowsley Hall, the principal seat of Lord Derby, is situated about six miles from Liverpool. The beautiful park is well wooded, and is very extensive. From an architectural point of view the mansion calls for very little comment. It is very plain, with the exception of a portion which has lately been restored. Of the garden, Mr. Harrison, the head gardener, stated that it was in no sense a show place; but a hurried run through some time ago very soon made me attach little importance to my courteous guide's remark, for there was much that would have done credit to any exhibition table, even though such a large demand is made upon the garden's resources. Excellent shelter is provided by splendid plantations of trees; and even if this did not p ove sufficient, the garden is entirely walled in, so that cutting winds are quite unknown. The walls are of red bricks, and everywhere filled with the choicest of Cherries, Pears, Apricots, and Plums, which are carefully trained and give a good return for the skilled labour bestowed on them, judging by the splendid crops.

bestowed on them, judging by the splendid crops.

The first house entered was a lean-to vinery newly planted, the Vines showing every promise of building up stout canes. Then we passed through a large Peach house, from which a good crop had been gathered, on to the Alicante house where some splendid bunches were colouring very well. We next entered the Black Hamburgh house, from which part of the crop had been gathered; but there was sufficient evidence in the bunches remaining to show what excellent well coloured bunches the house had contained. The Muscat house, which is in two divisions, contained what I unhesitatingly say, as finely finished and as even bunches as anyone could wish to see, and not a trace of shanking was noticeable. Another large house planted with Alicantes, Lady Downe's, and Trebbiano presented a grand sight, not only for the heavy crops the Vines were carrying, but for the extra quality of both bunch and berry. These Vines had for the greater portion been layered, a system of which Mr. Harrison is much in favour.

The Plum house was next entered. Some trees are in large pots, and others planted out, and in each case they were carrying a good crop of fruit. What struck me most was the healthy foliage, and, what is not often seen, quite free from any curl in the leaf. No wonder that good crops result from such excellent management. These Plums fruit year after year, and seem likely to yet do many years' service. The varieties most grown are Kirke's, Jefferson, Coe's Golden Drop, Reine Claude, Victoria, Prince of Wales, Ickworth Impératrice, and M'Lachlan's Gage, the latter being highly prized. Peaches and Nectarines carrying heavy crops are grown on the back wall of the Plum house. The Fig trees were also abundantly cropped, being the leading varieties—Negro Largo, Brown Turkey, and White Marseilles. The same remark as to a crop will also answer for the Cherry house; 3500 Strawberries are grown in pots, and they were looking their best. As an early variety John Ruskin had been tried, but was not very satisfactory. Waterloo for late work is grand, and there are very few places where it is grown so well as at Knowsley. The plants are layered in their fruiting pots, and are equal in every way to those which are previously layered in

A greenhouse and stove were beautifully furnished with a choice collection of flowering and foliage plants in the best of health. In the cool Orchid house the plants were in admirable condition, and Asparagus deflexus planted alternately with A. plumosus nanus, and covering the back wall, produced a chaste effect. One special feature is the culture of the Amaryllis, and one might go many miles before meeting with such a collection as is seen at Knowsley. They number over seventy varieties, hundreds of plants, and of different ages. They have been raised by Mr. Harrison, the result of crossings between Messrs. Williams' and Veitch's best varieties. Tomatoes and Melons are well grown. Knowsley Favourite is a popular Melon, and a good one judging from the handsome fruits the plants were carrying. A number of Solanums, with some excellent Poinsettias and Centropogon Lucyanum, and other winter flowering plants, were looking healthy. A large new conservatory, built entirely of teak wood, is nearing completion, and will prove of great service in accommodating the large Palms which arc so much needed, and which were in the old structure completely cramped for want of head room.

Outside, the Stock Princess Alice, a pure white variety and much superior to the old variety, was a picture in itself, and there is certain to be a great future for it. Vegetables of every description are grown in the best manner, and the fruit room was a model of what such a structure ought to be. At the Hall business is getting settled down again since the new Earl's return from Canada. Improvements in the

gardens are certain to take place, for many of the houses are very old fashioned, and there will be a much heavier demand in consequence of the larger family to provide for. Mr. Harrison is not only a thorough practitioner, but a good botanist, also an authority on British plants, and he rendered my visit to Knowsley both pleasurable and instructive.—R. P. R.

NATIONAL ROSE SOCIETY.

THE "manifesto," as Mr. Grahame humourously calls the explanatory note recently issued by the Secretaries of the N.R.S., was, it is scarcely necessary to say, in no way intended as a "counterblast" or "jeu d'esprit." It is really wonderful what a number of diverse and interesting titles such a harmless production can have called forth. It simply contained two statements necessary to the understanding of his circular and which should by rights have been mentioned in it. Mr. Grahame accuses the Secretaries of being dilatory; he, however, forgets that his circular only reached them after the middle of the week, and that the "manifesto" in question appeared in the Journal of Horticulture of the next, and that consequently no earlier answer to it was possible.—E. M., Berkhamsted.

ERNEST METZ.

Rose growers generally will do well to note and act upon the valuable hint of the very high authority of Mr. Benjamin R. Cant re Ernest Metz. He might have gone farther back than the last six years for so good a Tea Rose. As a flower it is capable of being as splendid as any Tea grown, whilst the constitution and strong free growth are considerably better than any of them that have as grand flowers. It is even better out of doors than under glass. I have grown it both ways in numbers every year since it was first sent out.—S. S.

Rose Jottings.

To strengthen Mr. H. Dunkin's note on striking Tea Rose cuttings I may mention that last autumn I cut off the top of a Souvenir d'un Ami in a pot, and as the portion cut off was straight and had the label attached to it, I stuck it in at the side of the pot, no further care being taken of it, it rooted and has bloomed several times.

Like Mr. B. R. Cant I was surprised at our friend "D., Deal's" rather disparaging note on Ernest Metz. I humbly second Mr. B. R. Cant's opinion of its excellence. As I write a lovely bloom is near me, and it runs a chance of equalling in my esteem both Catherine Mermet and her daughter The Bride. What can one say more? If Mr. B. R. Cant had in his mind the recent election, it seemed to me, viewing it perhaps somewhat critically, rather misleading. I cannot but think these three Roses would be nearly equal—in fact like the Irishman, who, when asked if he was badly off, replied that if there was another person in the world worse off than himself they must be "about aiquil." It will be hard, I fancy, to separate these three Roses in a Tea Rose election another year, and Mr. B. R. Cant's "certificate of merit" is, in my view, most worthily bestowed. Whether Waban will dispute the "pride of place" with the trio remains for the future to settle, but it promises well.

DID the last Rose that graced Mr. D. R. Williamson's study table leave him a thorny memento? In my innocence I have always thought that par excellence the queen of flowers gave us the most lengthy return for benefits bestowed. Now Mr. Williamson, writing of the Viola, says, "I hope my enthusiasm has not carried me away; but, in the special direction of durability, can as much be asserted of any other flower?" and then he goes on to compare Roses, and talks of "their" seasons being of "short duration." Granted that the duration of beauty in each separate bloom, as he remarks, is "marvellously short lived," still in some Tea blooms it has lasted sufficiently long to allow of exhibition at three consecutive shows. I presume, however, that Mr. Williamson means that the duration of the blooming period is short; but surely we Rose maniacs, if you will, are not in error when we assert that, given favourable conditions, the duration of bloom with our favourites is acarcely equalled by any other flower. With the help of glass it is possible to have Tea blooms in spite of wintry blasts or mantle of snow, and even on some of the highest land in Somersetshire I have picked buds of Safrano in February in the open in a warm corner; and once, an exceptional winter certainly, I picked a bunch of Gloire de Dijon buds, some beautifully formed, on New Year's Day, on a wall facing the north! Take our ordinary seasons out of doors and some of our Roses begin to give us stray blooms in April, and continue in some variety to the end of October and perhaps even later. This is fairly constant blooming. I agree heartily with Mr. A. Hill Gray and say the true perpetuals are the Teas.

Compliments to "E. K., Dublin," we do not intend to be shut out. Let him take care we don't scratch him, and a Chrysanthemum cannot retaliate.—Y. B. A. Z.

EVENTS OF THE WEEK.—The coming week will not be a particularly busy one for metropolitan horticulturists. On Friday and Saturday, August 18th and 19th, the National Co-operative Festival will be held at the Crystal Palace, and on Wednesday and Thursday, August 23rd and 24th, there will be an exhibition of flowers and fruit at the Gardening and Forestry Exhibition. The Devon and Exeter Horticultural Society's Show will be held on Friday, August 18th. On Wednesday, August 23rd, the Shrewsbury Floral Fête and the Harpenden Horticultural Society's Show will be held, and on Thursday, August 24th, is the Basingstoke Show, and on August 24th and 25th the annual Show at Weymouth will be held.

- THE WEATHER IN LONDON.—For several days the weather has been oppressively hot, the temperature ranging between 80° and 90°, while on several nights it has not fallen below 70°. The heat appears to have been more enervating than at any previous time during a memorably hot year.
- A Well-won Honour.—The Queen has conferred the honour of knighthood upon Dr. Joseph Henry Gilbert, F.R.S., who has been associated for more than fifty years with Sir J. B. Lawes in the agricultural experiments conducted at Rothamsted.
- GARDENING APPOINTMENTS.—Mr. William Dancer succeeds Mr. C. Smith as head gardener to Major A. C. Little, Rystan House, Tetbury, Gloucestershire. Mr. C. Boatwright, gardener to the late Mr. E. Covell, Beckenham Place, has been appointed gardener to J. L. Bucknell, Esq., Langley Court, Beckenham.
- WHO PLANTED THE HAMPTON COURT VINE?—A statement having appeared in the "Standard" that the old Vinc at Hampton Court was planted in 1763 by Lancelot Brown (otherwise known as "Capability"), a Hampstead correspondent thus writes :- "I only know that I have always heard my late father say that the great Vine at Hampton Court was planted by an ancestor of his whose name was Robinson, and who most certainly was at Hampton Court, and that George III. presented him on the occasion with a snuff-box, which said box my father always treasured, and which I have and value. It is tortoiseshell, inlaid with silver, and very pretty. Oddly enough, it is only about three weeks since I was speaking to a cousin about the great Vine, and I said, 'Well, you know an ancestor of ours, a Mr. Robinson, planted that Vine, and I have the snuff-box that George III. gave him when he planted it.' The reply was, 'Yes, I have always understood from my father (he was own cousin to my father, and one of his names was Robinson) that such was the case,' and the remark was made that I ought to have the fact engraved on the box." From remarks in another column it will be seen that the grandfathers of some half-dozen persons are claimed as the planters of the Silwood Vine. We have seen it stated that an ancestor of Mr. Thomas Laxton planted the Hampton Court Vine.
- TUNBRIDGE WELLS AND TONBRIDGE GARDENERS' ASSO-CIATION.—The members of this Society, conducted by Mr. D. Cornwell, paid a visit to Messrs. Cannell & Sons, Swanley, on Wednesday, Aug. 9th. The company, numbering upwards of sixty, were conducted over the nursery, and many remarks of a laudatory character were let fall respecting the magnificence of the Begonias, the brightness and diversity of colouring displayed amongst the Zonal Pelargoniums, the curios in the houses devoted to Cactaceous plants, the large and beautiful collection of the now almost forgotten Verbena, and the varied hues seen in the houses of Fuchsias. From thence they went to inspect the nurseries of Mr. Phillip Ladds, round which they were very kindly conducted by Mr. Ladds, jun. Here delight was largely intermingled with astonishment at the magnitude of the operations carried on with such striking success. In the afternoon Messrs. Cannells' Eynsford Nurseries and Seed Farms were visited, afterwards journeying to the Eynsford Show, which was, very fortunately for them, being held on that day. There can be no doubt that a most enjoyable and instructive day was spent, and the thanks accorded to Mr. Cannell were hearty and sincere, nor were they undeserved, for that gentleman had been indefatigable in his exertions to make things pleasant, and admirably he succeeded.—H. W.

- FRUIT CROPS IN THE MIDLANDS.—"Observer" writes:— "So far as I can see the fruit crops in the midland counties are fairly good, and in some cases much beyond the average. Apples appear to be very plentiful, and are selling at nominal prices in local markets. Plums are plentiful, and it is with difficulty that small growers can dispose of them at remunerative prices, especially the ordinary varieties. Pears are not quite so abundant, these apparently having failed to set well"
- One dry season in the sixties Runner Beans in this neighbourhood were a complete failure, although growing strong from watering and mulching. Noticing a row in a cottage garden bearing a very heavy crop I asked the cotter how he managed his Beans. "Water them overhead, master, in the evening to set them." I did not water mine overhead but syringed them, and had plenty of Beans, and I have often since then stopped the flowers failing off by simply syringing in the evening. I am doing so now and have plenty of Beans.—Jas. Hamilton, Byrkley Gardens.
- JARGONELLE PEAR.—One of the finest and handsomest trees of this excellent early Pear I have seen was in a small cottage garden at Chessington, Surrey, very recently. The tree is probably fifty years old, very tall, remarkably well proportioned, a perfect natural standard pyramid, in the most complete health, and carrying a grand crop of fine fruit. On the upper boughs they hung literally like ropes of Onions. Autumn Bergamot, there called the "Bergamy," and Beurré Capiaumont were also fruiting wonderfully. The district seems to be specially a favourable one for Pears.—A. D.
- —— APPLE SHEPHERD'S SEEDLING.—I found this Apple represented by large old trees growing in a Surrey village the other day. Dr. Hogg, I observe, states in the "Fruit Manual" that it is identical with Alfriston. Finding it under the first appellation had led me to conclude that it was of local origin; but of course Alfriston has a national reputation. Owing to the height of the trees, and the fact that because of the drought the fruits were not of the usual size, it was difficult to determine what it was; but I daresay Dr. Hogg is right, especially as the variety is mentioned in the locality in question as a good cropper and keeper.—D.
- Cucumber Peerless.—When I was recently at the Swiss Nursery, Farnham, and looked through several houses of Cucumbers of various kinds, the fruits hanging for seed in such great quantities I thought a photograph of the houses would have been regarded as imaginary. The last house Mr. Mortimer took me into was filled with Pecrless, as sent out by Messrs. Sutton & Sons, although certificated under the name of Success. Certainly was the simile, "thou hast kept the good wine until now" here most applicable. The long fruits were of the most perfect form, wonderfully handsome, and I think for length and beauty difficult to surpass. It is a variety, however, that, in spite of the abundance of fruit, seeds most sparingly.—A. D.
- AGRICULTURAL FERTILIZERS AND FEEDING STUFFS.—The House of Commons Grand Committee on Trade have concluded their revision of the Fertilizers and Feeding Stuffs Bill, introduced by the Minister for Agriculture (Mr. H. Gardner). Sir J. Gorst presided. It was agreed that County Councils should be empowered to appoint officers to take on behalf of buyers samples for analysis of the products dealt with by the measure. It was resolved that any person fraudulently tampering with such samples should be liable to six months' imprisonment, and that the Board of Agriculture itself, as well as other parties mentioned in the measure, might prosecute under it. The Bill as amended was ordered to be reported.
- -- INTERNATIONAL EXHIBITION OF FRUIT CULTURE. -- We have been requested to draw the attention of the fruit growers to an International Exhibition, to be held by the Russian Society of Fruit Culture, under the patronage of the Czar, at St. Petersburg, in the autumn of 1894, with the object of showing the present condition of the cultivation of fruit and vege abics, of viticulture, of the cultivation of various special plants, and the manufacture of their products. The Exhibition will comprise the following sections:-1, Fresh fruit; 2, fresh vegetables; 3, dried fruit and vegetables, preserved or treated by other processes; 4, wine, cider, perry, and other fruit beverages; 5, Hops and medical herbs; 6, secds; 7, fruit trees and bushes; 8, horticultural implements and appliances, and technicality of production; 9, literary, scientific, and educational accessories, collections, plans, &c. Applications for further information should be addressed to the offices of the International Exhibition of Fruit Culture, 1894, Imperial Agricultural Museum, Fontanka, 10, St. Petersburg.

- BOTTESFORD HORTICULTURAL SOCIETY. Like many other horticultural societies, the members of above held their annual Exhibition on August 7th. It was a successful gathering, there being upwards of 600 entries in the classes for fruit, flowers, and vegetables. In every section the exhibits were of good quality and reflected credit upon the respective growers.
- EARLY APRICOTS.—Mr. B. G. Jenkins, West Dulwich, S.E., writes:—"I enclose three or four fruits from an Apricot tree I have growing on an open standard in my garden. The tree, which has not had the slightest attention, is carrying upwards of 600 fruits, all in good condition." [Shipley's Apricot is the name of the fruits our correspondent sends, the colouring and flavour of which are alike excellent.]
- HAILSTONES IN LINCOLNSHIRE.—A correspondent writes:—
 "A heavy thunderstorm prevailed in South Lincolnshire on Thursday morning, August 10th, during which hailstones of an enormous size fell. At Grantham some pieces of ice as large and as square as ordinary lump sugar were picked up. Much damage has been done in the neighbourhood to glass houses, and Apples and Pears are injured in some gardens."
- MELON INGESTRE HYBRID.—Last week in visiting the gardens at Ingestre, where fruits of all kinds are so well grown, I was much impressed with the new Melon Mr. Gilman has raised by crossing Hero of Lockinge with Countess, the result being a new variety of great excellence. The constitution of the plant is strong, and it is a free setter. The fruit is beautifully netted, of a bright golden yellow colour, skin thin, and shows no tendency to crack; flesh greenish white, and flavour of the highest type. In one house containing eight plants there were from thirty to forty ripe fruits, averaging from 3 to 5 lbs. each. This Melon was awarded a certificate of merit at the meeting of the Royal Horticultural Society, May the 9th.—ROBERT COCK, F.R.H.S.
- GRAND YORKSHIRE GALA.—At the general meeting of the guarantors and life members of the above held last week, the recommendation of the Council that the sum of £251 be handed over to the York charities was approved. The sum of £175 was added to the reserve fund, bringing it up to £2000, and the remaining balance carried forward to next year's account. The following grants were made:—York County Hospital, £50; the Dispensary, £50; Blue and Grey Coat Schools, £30; Bootham Asylum, £25; Yorkshire Society's School, London, £21; the Industrial Schools, £20; Wilberforce School for the Blind, £10; the Penitentiary, £10; the Invalid Kitchen, £10; the Nurses' Home, £10; Girls' Friendly Society, £10; Society for the Prevention of Cruelty to Children, £5; total, £251.
- JAM SHARPERS .- Some revelations made in the columns of "Food and Sanitation" seem to show that some of the smaller jam manufactories in London are badly in want of inspection by the public health officers. Good jam can be, and is, sold at a very low price, but some of the jam eaten by the poor is made of disgusting ingredients. The other day several tons of fruit, described as in a revolting state, were seized at one factory in North London. It included three vanloads of tinned Pine Apples, quite rotten, and some tons of Gooseberries, Apples, Oranges, and other fruits, as well as a lot of Onions and Walnuts, mostly putrid. A strange find was a quantity of Plum stones, dirty, as if gathered in the streets. There can be little doubt that these were intended to be mixed with so-called Plum jam, which is not made of Plums at all, but of Marrows, Apples, and other vegetable matter in a more or less useless condition. In some instances poisonous colourings are used to give the manufactured article an attractive appearance.
- GOLDEN RATHRIPE PEACH .- Mr. E. Trollope writes from Coombe Park, Reading: -- "I send a sample of Peaches gathered from a south wall, outdoors, labelled Golden Rathripe. It is a variety which I think is not generally grown, but appears to do remarkably well here. It is a good cropper, one of the finest-looking Peaches, and the flavour is much liked. We have had a wonderful crop of fruit of all kinds this year, Apricots and Plums especially. We face due south, and everything was quite a month earlier than I ever knew it." [We think the name of the Peach is incorrect, yet although the Golden Rathripe may be regarded as one of the best of the yellow-fleshed American Peaches in quality, it cannot be compared with our best established varieties. We have known more than one instance of Golden Rathripe being removed from Peach houses as disappointing after occupying valuable space for years. It may possibly be better in favourable positions outdoors, and especially, perhaps, during a season like the present one. Tastes also vary, and there may be palates to which these pasty yellow-fleshed Peaches are agreeable. The one sent is the clingstone, Pavie Jaune.]

- NELUMBIUM SPECIOSUM NUCIFERUM.—This very scarce plant, the Sacred Bean of Egypt, so rarely seen in flower, is now in bloom in one of the stoves at the Royal Gardens, Frogmore, and was an object of great interest to the Birmingham Gardeners' Association on the occasion of their recent visit. It is a tall growing species, with large bold foliage, and the flowers pure white and deliciously fragrant. It is growing in a pan of water.
- THE annual report of the ROYAL BOTANIC GARDEN, CAL-CUTTA, of which Lieut-Colonel G. King, F.R.S., is Superintendent, has been issued. From it we learn from "Nature" that all the efforts to introduce the cultivation of the Japanese Paper Mulberry have failed. As the Superintendent points out, this Mulberry yields a beautiful fibre, which is naturally so white that it requires very little bleaching, hence it seems a pity that no wealthy landowner has taken up its cultivation on a large scale.
- GRANTHAM AND DISTRICT HORTICULTURAL SOCIETY.—
 The first annual Exhibition of the above Society was held at Grantham on Monday, August 7th. Upwards of eighty classes were provided, and on the whole these were well filled, the exhibits being of excellent quality. Messrs. J. R. Pearson & Sons, Chilwell Nurseries, Beeston, Notts, sent some splendid floral designs and bouquets. Messrs. J. W. Brown & Sons, Grantham and Stamford, also sent miscellaneous exhibits, as likewise did Lord Brownlow, Sir Hugh Cholmeley, Sir J. Thorold, and others.
- Torquay District Gardeners' Association.—The first annual excursion of the above Society took the form of a visit to Taunton Show on the 10th inst. The party, consisting of eighty members, left Torquay by special train, arriving at Taunton soon after 10 A.M. Luncheon was partaken of at the George Hotel, Mr. W. B. Smale presiding. In addition to visiting the Show several of the party inspected Mr. W. H. Fowler's Chrysanthemums at Claremont, and admired the splendid condition of the plants. Taunton Castle was also visited, and the party returned home well satisfied with their day's enjoyment.
- Turning Natural Advantages to Account,—Professor Massey of the North Carolina Experimental Station writes that he can see no reason why the cultivation of vegetables under glass should not be profitable in the Southern States at points where quick transportation northward is possible. "If Boston growers can force Cucumbers at a profit by using double sashes and heavy coal bills, why could not this be done better still in North Carolina, with cheaper houses and half the expense for fuel? If Lettuce is grown at a profit with fire heat, and sent from Boston to Washington, why should not a man in North Carolina grow it at a profit when he can raise equally good Lettuce in a simple cold frame?" These remarks are suggestive, and have wide application.
- Painted Fruits.—The "Evening News" says the ingenuity of the "bird faker" who could hide russet coats under all the hues of the rainbow is being applied by Parisians in another sphere. Ingenious fruit dealers have invented a way of colouring their wares in order to improve their market value. They stain ordinary Oranges a deep red, making them look like Mandarins, which fetch much higher prices. They also tint Pine Apples to make them look more attractive, and dye the common white Strawberries a lovely red. Melons are now being treated in a similar way, and tinted a fine orange, their flavour being increased by injecting an essence of Melon. The latest development of this business is in connection with Pears, which are dyed red for a third of their size, and blue below, thus presenting the national colours when peeled. These are said to be in some demand for dessert fruit on account of their novelty.
- .-- THE NEW YORK FRUIT MARKET.—The "Garden and Forest' says -"Cherries from California seem as beautiful and abundant as they were two months ago. The varieties, Royal Anne and Black Republican, are the popular favourites. Congress Pears are coming from the same State and cost a little more than the Bartletts and Howells. Crawford's and Hale's Early are the principal varieties of Peaches which are now coming from the Pacific coast. Plums are still abundant and cheap. From the Southern States Le Conte Pears are coming of rather lower than ordinary quality. Peaches from the far southern points are becoming rare, and those from Maryland and Delaware are taking their places, and are of fair quality for early varieties. Raspberries are practically out of the market. Astrachan and Sweet Bough Apples are 1.75 dols. a barrel. Pocono Mountain Huckleberries are twelve cents, a quart. Good Gooseberries are worth two dols, a bushel. Florida continues to send Delaware Grapes and some choice Grape fruit."

- THE BIRMINGHAM GARDENERS' ASSOCIATION. - A large number of members (236) of this Association visited Windsor Castle and Frogmore Gardens on the 14th inst. They were met at the Windsor Station by Mr. Thomas, and conducted by him through the State apartments, the Terrace garden, the Albert Memorial Chapel, St. George's Chapel, and the stables. At the dinner held at the Town Hall a hearty vote of thanks was accorded to Mr. Thomas for his great kindness, also to the Rev. Canon Dalton for kindly volunteering to conduct the party through the chapels, and explaining features of interest. The famous Vine at Cumberland Lodge was subsequently inspected, and found in admirable condition, many of the bunches on the young growths being of good size and quality. The 300-acre lake Virginia Water was a great treat, and the Shaw Farm much admired. Frogmore Gardens, with their high standard of excellence, were a pleasure to see. A "grand outing" was the universal verdict, and unstinted praise was accorded to Mr. Thomas for having given so much time and personal attention to details the whole day through.

- EYNSFORD SHOW.—The Eynsford Cottage Gardeners' Mutual Improvement Society held their annual Show in Lullingstone Park by the kind permission of Sir William Hart-Dyke, M.P., the display of flowers and vegetables being a highly creditable one. Interest was without doubt chiefly centred in the special prizes offered by Messrs. Henry Cannell & Sons, Swanley and Eynsford, for a collection of vegetables grown from their seeds, to consist of six Tomatoes, six Carrots, a dish of thirty pods of Peas, four Cabbages, a dish of nine round and one of nine kidney Potatoes, three Cauliflowers, six Beetroots, three Marrows, six Turnips, thirty pods of Scarlet Runners, and nine Onions, spring sown. With the prize in this class, which was open to the various Kentish Amateurs' Societies, a silk sash was given having on it the words "Champion Vegetable Grower of Kent" in raised silk characters, also given by Messrs. Cannell. Six collections were staged, the Milton-near-Sittingbourne Society being adjudged the victors by the narrow majority of three points, Eynsford, the holders during the last year, being placed second, and the Kemsing and Otford Society a very close third. Amongst the best produce in the Milton stand were Tomatoes, Carrots, Onions, Turnips, and Scarlet Runners; the Eynsford stand being strongest with Potatoes, Peas, Onions, Cabbages, and Cauliflowers. The sash will be competed for again next year, when the competition will, it is expected, be even stronger, and the result will be looked forward to with eagerness in the county.—H. W.

- THE DINNER CONTEST AT CARSHALTON. - The Wallington Herald thus refers to this contest: - "It was evident that considerable thought had been bestowed on the subject, and that many of the dinners had not been prepared until the way in which the money should be spent had been arranged over and over again. It was noticeable that hardly any two had chosen the same joint of meat, or had prepared it in exactly the same way. Some had first made soup from the meat before cooking it, to appear on the table, others had roasted or boiled, whilst still others had had recourse to the satisfying and nutritious meat pie. The highest number of marks were awarded to Mrs. Smee (not a competitor), who had thus arranged her menu, and divided the money allowed her: Two mackerel 4d., meat pie, 9½d., Potatoes ¾d., Beans 2d., bread 1d., sweets 3d., cheese $\frac{1}{2}$ d., butter $\frac{1}{2}$ d., and vinegar and spice ½d., total 1s. 9¾d. The first prize was awarded to Mrs. Stevens of West Street, Carshalton, who had thus spent her money: Soup from beef, flavouring 1d., pressed beef 9d., Beet, Parsley, and glazing 1½d., Beans 3d., Potatoes 2d., bread 1d., Plum tart 4d., custard 1½d. Mrs. Barr took second prize, her dinner consisting of breast of mutton 11d., Potatoes 2d., Vegetable Marrow 1d., Cabbage 1d., pudding (milk rizine) 1½d., bread and butter 1½d., Apple pie 3d., cheese 1d., Lettuce ½d., and herb beer ½d., she being the only competitor who had made any allowance for the wants of thirsty Nature. Other competitors were equally ingenious, and there can be no question that this new departure has given many a bothered housewife a few ideas of what can be done with a small sum of money by the exercise of a little thought and care. It is, however, but fair to say that a good deal of doubt was expressed by many of the visitors as to the possibility of purchasing in an ordinary way the quantity of meat specified in many of the exhibits at anything like the amounts placed opposite to them, even if the purchases were delayed until the butchers were anxious to sell. Of course the value of the competition is altogether lost if there are any doubts as to the bona fides of the prices alleged to have been given, and therefore it would be well, if the class is repeated next year, if some sort of a certificate were to be required from the competitors showing that the purchases had been made in the open market, at the prices then current, and that the tradesmen had not been told what they were for."

ABOUT 150 members of the SCOTTISH ARBORICULTURAL SOCIETY have been spending a week in the south of England. After inspecting Burnham Beeches, Windsor, Cliveden, the New Forest, and Kew their tour closed on Saturday with a visit to the Gardening and Forestry Exhibition at Earl's Court. Mr. H. E. Milner, the Chairman of the Exhibition, in an excellent speech at the luncheon, thanked the Scottish Society for spreading throughout the world a knowledge of the best methods of cultivating trees. Mr. Malcolm Dunn, in responding, remarked that they had seen much to avoid in forestry, yet something good and worth remembering, not the least being generous hospitality. The Forestry exhibits were subsequently inspected and explained by Professor Curtis of Downton College. The visitors then eooled themselves at Captain Boyton's Water Show.

- THE JAPANESE APPLE.—Referring to the "Forest Flora of Japan" in the "Garden and Forest," "G. S. S." says :- "Of true Apple trees there is apparently only a single indigenous species in Japan, the Pyrus Toringo of Siebold. This is the tree which is often cultivated in American and European gardens as Pyrus Malus floribunda, Pyrus microcarpa, Pyrus Parkmani, Pyrus Halleana, Pyrus Sicboldi, and Pyrus Ringo. It is a common and widely distributed plant in Japan, growing from the sea-level in Yezo to elevations of several thousand feet in central Hondo, usually in moist ground in the neighbourhood of streams. Sometimes it is a low bush, but more often a tree 15 to 30 feet in height, with a short stout trunk and spreading branches. The leaves are exceedingly variable, and on the same plant are often oblong, rounded or acute at the apex, or broadly ovate or more or less deeply three-lobed. The fruit, which, like that of the Siberian Pyrus baccata, loses the calyx before it is fully ripe, resembles a Pea in size and shape, and in colour varies from bright scarlet to yellow. In early spring Pyrus Toringo is one of the most beautiful of the trees found in our gardens, where it is perfectly hardy, and covers itself every year with fragrant pink or red single or semi-double flowers."

- ROYAL BOTANIC SOCIETY OF LONDON. - The fifty-fourth anniversary meeting of this Society has been held at the Gardens, Regent's Park, Mr. Charles Brinsley Marlay in the chair. The Dake of Teck was re-elected President, and Mr. H. Lindsay Antrobus Treasurer, for the ensuing year. From the annual report it appeared that the number of new Fellows elected was nearly the same as last year. The various exhibitions and fêtes had been successfully carried out, the exhibits both in number and quality being above the average. That of the evening fête especially had been the largest since it was instituted twenty-two years ago. The scientific work of the Society had rather increased than otherwise. Nearly 700 students of science, art, and medicine had received free orders of admission of from one to three months during the year, and the facilities offered to schools, classes, and scientific societies generally had been largely taken advantage of. Among new clients in this branch might be noted many of the students studying botany in the London Board Schools. The special plants successfully cultivated for the first time included specimens of the Mangrove, Rhizophora, and an ant habitation plant from Torres Straits. Within the spiny tuberous root of this plant numbers of the common red garden ant have made a home, to the apparent benefit of both. The meeting closed with a unanimous vote of thanks to the

- KINETON FLOWER SHOW. -- Notwithstanding the drought of early summer the present season seems to be an unusually good one for the production of late Potatoes. At the above-named Show, which was held on the 10th inst., Potatoes were a remarkable feature, the tubers being characterised by great size, good form, and perfectly clear skins. It is rare indeed to see such splendid examples of good culture exhibited at local shows, and the inhabitants of the district deserve great credit for their cultural achievement. In the non-competing classes, Mr. J. Garner, gardener to E. Cassell, Esq., exhibited a fine collection of fruit, containing Black Hamburgh and Foster's Seedling Grapes, both of which were noteworthy for their beautiful colour. Mr. F. Perkins of the Leamington Nurseries staged an excellent and effective group of plants. The Show was held in the delightful grounds of Lord Willoughby de Broke, whose gardens were thrown open to the public during the afternoon and evening, when large numbers of visitors enjoyed a pleasant stroll around them. In the flower garden I noticed fine beds of Begonias and Tropæolum Mrs. Clibran; the latter is evidently an acquisition, destined to become universally popular. Chrysanthemums were also looking wonderfully well, but the erown buds had shown several weeks in advance of their usual time, and were therefore removed.—H. D.

LÆLIA TENEBROSA WALTON GRANGE VARIETY.

A VERY beautiful and noteworthy Orchid was exhibited at the last meeting of the Royal Horticultural Society by Mr. Stevens, gardener to W. J. Thompson, Esq., Walton Grange, Stone, Staffs. It was a form of Lælia tenebrosa with yellow sepals and petals, and attracted a good deal of attention and admiration from the orchidists present. It is without doubt a fine and imposing variety, the flowers being of considerable size and the colouring harmonious. The sepals and petals are clear butter yellow, the lip white, the throat deep crimson. A first class certificate was awarded, and fig. 22 represents the form. Mr. Stevens informs us that the flowers came on the current year's growth from an imported piece

FIG. 22.—LÆLIA TENEBROSA, WALTON GRANGE VARIETY.

that was purchased early this year—a fact which should be a further encouragement to those who buy importations mainly in the hope of something unexpected and valuable appearing amongst them.

THE SUMMER MANAGEMENT OF WALL FRUIT TREES.

THE first important step to be taken in the building up of the healthy fruitful fruit tree is to give it adequate root room, needful drainage, and suitable soil, following with a skilful manipulation and distribution of the summer growths, and keeping them in a clean condition. The latter essential is not so much a question of time as it is a want of prompt action. Assuming that young trees were duly planted on the lines indicated soon after the fall of the leaf last autumn, and that in training the shoots to the trellis or wall in the spring no hard and fast cutting back method of procedure was practised, but on the contrary, the five, seven, nine or a dozen growths of the previous year were spread out widely and evenly apart over the space allotted to each tree, there will be ample room for laying in sufficient shoots of the current year's growth.

The summer management of fruit trees consists in keeping them in a healthy growing condition at the roots as well as above ground. If the soil is dry about the roots, as is generally the case with wall trees, even in the winter months, no amount of manipulating and syringing of the branches and leaves will bring about the same results that would be obtained from trees growing in moist soil.

Root and branch must be kept in a healthy state from the time the first sign of growth appears, that is, the soil should be kept uniformly moist about the roots, top growth being judiciously disbudded and pinched, and kept free from the attacks of insects. Aphis and red spider speedily make serious inroads on the leaves if not promptly dealt with. A solution of clear water and tobacco juice at the rate of 1 quart of the latter to 4 gallons of the former applied with the syringe to the trees affected with green or black fly in the afternoon after the sun has gone off the trees, in the case of trees on south and

west walls, will not only rid them of the insects then on the trees, but, as a rule, will render the foliage distasteful to future attacks. Peach trees being well washed with clean water from the garden engine every bright afternoon during the summer and carly autumn months will prevent them being attacked by red spider.

Where Peach and Nectarine trees have not been properly disbudded earlier in the season no time should be lost in reducing the number of young growths, retaining those nearest to their bases to produce fruit next year. Lay them in between the shoots from which they proceed with small twigs—say at 3 inches apart, afterwards pinching out all foreright shoots or secondary growths as they appear. Remove the points from any extra vigorous young shoots at about 2 feet, so as to direct the flow of sap into the weaker, and thereby conduce to an even growth in the tree. Apricots, Pears, Plums, Apples, and Sweet Cherries should have the leading young shoots trained in position to cover the wall space, pinching at 2 feet or so for the purpose indicated, and stop-

ping the foreright growths or breastwood at about six leaves from their origin. Morello Cherries should be treated the same as Peach and Nectarine trees. A judicious course of pinching and stopping of the shoots being pursued during the summer months tends to the plumping of wood buds, the formation of spurs or fruit buds, and a promotion of balance of growth in the trees operated on. It also tends to the swelling of the crop to greater dimensions than would otherwise be attained, and prevents the forces of the trees being wasted, as is the case when breastwood 15 to 24 inches long is allowed to grow before being cut back in autumn, as is too often the case. Figs may be treated in the manner recom-mended for Peaches, only the shoots should be given more room to develop. All young retained growths should be secured to the wall or trellis in due time, leaving room in the shreds or ties for the enlargement of growth.—H. W. WARD.

SWEET PEAS.

LAST summer, in the course of some remarks on Sweet Peas. I referred to the bad germinating quality of Englishsaved seeds of the previous year. If anything last autumn proved even more disastrous, so that those only who were judicious in their treatment of the seed are likely to have had a satisfactory growth. The weakly appearance of the seeds of several varieties impressed me so unfavourably that I sowed none in

the open ground, but took the precaution to sow the seeds thickly among light sandy soil in ordinary cutting boxes, from whence in due time the young plants were transplanted into the garden. have quite 150 yards of Sweet Peas, the plants having been raised as above, and every foot of the lines is covered with healthy flowering plants. In practice the operation is not so absorbent of labour as might appear. When the seedlings had grown 6 inches in height they were planted in the following manner:—After a line had been stretched along the ground a cutting was made with a spade to a depth sufficient to allow the roots to be spread out therein. Then while one man put the plants in their places another followed with a spade and filled in the soil. All earth was shaken off the roots before being planted. According to sort each plant was from 2 to 6 inches apart. A few Spruce Fir branches were placed on each side of the row of plants, these forming an efficient protection until longer sticks were required to support the lengthened growths. New varieties, and a few intended for seed-producing purposes were brought forward in small pots. These were planted at a foot to $2\frac{1}{2}$ feet apart. I am hopeful of obtaining a supply of good seeds from these specially treated plants; always, however, entertaining a dread that sparrows and finches may leave but few.

I have sometimes heard it remarked that the improved forms of Sweet Peas when compared with common strains are not so telling as garden flowers. Possibly that is so. As cut flowers, however, there can be no doubt as to the immense superiority of the former, and with regard to effect in mass that is very much a matter of opinion. It is the same in reference to new sorts. I have heard the beauty of Venus disparaged by one person while another upheld it as a charming flower; so also with Countess of Radnor. The same diversity of taste is apparent in present day Carnations, more especially in those peculiarly tinted forms which are sent over by French and German cultivators.

I thought I would like to test the value of a selected number of Sweet Peas commercially. The variety most "run on," in the words of the salesman, is Mrs. Gladstone, but Her Majesty is also good. These two varieties are also very floriferous, the latter, owing to the large size

of the individual blooms, bulking well. When the new white form, almost rivalling Her Majesty in size, is sent out by Mr. Eckford no variety ought to be more profitable. Blanche Burpee is the name of this variety, and growers would do well to note its advent. Mrs. Gladstone has a formidable rival in Blushing Beauty, a variety not quite so floriferous, but with much larger flowers and of a softer more sating shade. Of crimson forms I still like Cardinal. Firefly has a larger bloom, but perhaps hardly so bright. Lady Penzance is excellent, and other good ones that I like not already named are Mrs. Eckford, Orange Prince, Captain of the Blues, and Royal Robe.—B.

MR. LAXTON AND HIS WORK.

THE name of "Laxton" is so familiar to readers of horticultural literature all the world over that a portrait of the raiser of more new vegetables of sterling worth than probably any other man of his time, and also of several Strawberries and flowers, cannot fail to be acceptable

to the great body of amateur and professional cultivators.

Mr. T. Laxton commenced his experiments in hybridisation as an amusement about the year 1865, and on 7th July, 1868, he obtained his first certificate from the R.H.S. for the Pea Supreme, raised by crossing the old Sugar Pea (having an enormous pod, but few seeds) with Ne Plus Ultra. This was followed by Alpha, certificated on August 2nd, 1869. At the same time he took the Zonal Pelargonium in hand, raising Jewell, certificated in 1871, and Emily Laxton, one of the first semidouble scarlets. He also raised the first double white, named in honour of the late Jean Sisley. Continuing his work among Peas he next produced William I., Dr. Hogg, Marvel, Omega, Fillbasket, and G. F. Wilson.

Roses were not overlooked, his first being named Chas. Darwin, followed by Anne Laxton, Emily Laxton, Dr. Hogg and Mrs. Laxton, all purchased and sent out by Messrs. G. Paul & Son, Cheshunt. Princess Louise, Duchess of Bedford and Mrs. Harry Turner were also raised by Mr. Laxton. He still continued his experiments with Peas, and corresponded with the late Mr. Charles Darwin on the cross-

fertilization of the Leguminosæ.

Mr. Laxton removed to Bedford in January 1878, and took trial and experimental grounds at Girtford, devoting his whole life and energy to the work he had always so much at heart. His next certificate, gained in 1879, was for Minimum Pea, a dwarf only 6 inches high; then followed John Bull, William Hurst, Evolution and Charmer. He also at the same time gave attention to Potatoes, raising by cross-fertilization Reward, Bouncer and Beds Hero, and selected the valuable white extensively grown by market gardeners as well as many others. Sweet Peas attracted his notice, and he raised the Invincible Carmine (still one of the brightest scarlets) followed by Invincible Blue, the nearest approach then to a blue Sweet Pea, but time would not allow of his continuing this branch, which he relinquished in favour of Strawberries.

His first raised at Girtford was King of Earlies, followed by Captain and the now world-renowned Noble. This, unlike nearly all his other seedlings, was not an artificial hybrid, but a natural one from Forman's Excelsior, probably fecundated by bee agency with the strong growing American variety, Kerr's Prolific. He sowed the seeds from an exceedingly fine fruit, as he believed in the deterioration of a stock through saving seed, as is often done after all the best pickings have been taken. Tomatoes were also treated by him with success Lexton's been taken. Tomatoes were also treated by him with success, Laxton's Open Air being still considered one of the best. Onions were not overlooked, and Laxton's Sandy Prize was the result of his endeavours for improvement. Then followed more Strawberries, Latest of All, A. F. Barron, Commander, Jubilee and White Knight. Potatoes still had a share of the labours, the recently certificated Early Laxton, (Sharpe's Victor × Ashleaf), being an improvement on both, and likely to be largely grown both in private and market cardons.

to be largely grown both in private and market gardens.

Peas were still a factor, Walton Hero, Earliest of All, Early William (the early selection of William the First), Alderman, Oracle, then the fine "Gradus," which he considered his greatest achievement (Earliest of All & Duke of Alberty), producing rode as early as the former with of All × Duke of Albany), producing pods as early as the former with the size of the latter. It was only distributed last year by the raiser in conjunction with Messrs. Harrison of Leicester. The Brassica tribe did not claim much of Mr. Laxton's attention, but Chou de Bedford was raised by him from the Chouve Tronchuda.

Unfortunately, Mr. Laxton was taken away when his work was likely to gain for him some pecuniary recompense for the time and money expended in producing his novelties. His great aim was to produce something better and distinct from existing varieties. Nearly everything raised was the result of careful selection and trial after artificial cross-fertilisation, not, as in so many instances, the mere selection from some well-known variety. He always advocated the careful selection and seeding from the best and strongest flowers or fruits. He never hybridised two weakly growing varieties. He also firmly believed in seed-saving from the earliest seed to produce earlier strains, and in this he was particularly successful—as, for instance, in the selection of William the First Pea, which gave him a strain called Early William, distinctly in advance of the existing stock.

Runner Beans.—The Czar, the largest white-flowered Runner; Girtford Giant, a cross between Czar and the Old Scarlet; and the new Titan (Czar × Girtford Giant) are evidences of his success in this direction. Laxton's Open Air Cucumber was obtained from the outdoor

Ridge × Telegraph, and produces in good seasons very handsome smooth fruits in the open. Much as Mr. Laxton has done he has left much uncompleted, and as he often remarked a man in his profession ought to have three lifetimes to see his work through. His last Strawberry Royal Sovereign, from King of the Earlies × Noble, he considers the best he has yet introduced, being only distributed this season.

Mr. Laxton was for many years a Fellow of the Royal Horticultural Society, and served on the Fruit Committee. He was also formerly a Fellow of the Linnean Society. He wrote articles for horticultural journals both at home and in America till his health failed, thirty years of incessant work at his life hobby leaving him enfectled. He leaves a widow and three daughters not, we are sorry to hear, too well provided for, and also four sons, by two of whom, William and Edward, the business will be continued. Mr. Laxton was an affectionate husband, indulgent parent, and a modest, unassuming, genial man. He was born at Tinwell, near Stamford, in 1830, and died on the date mentioned last

FIG. 23.—MR. THOMAS LAXTON.

week. His remains were interred in the Bedford Cemetery, numerou wreaths being placed on the bier by relatives and friends.

The above is an imperfect record of Mr. Laxton's work, but it suffices to show that his name will long have a place in the annals of

PERMIT me as an old correspondent to express the surprise and deep regret with which I saw the announcement of the death of my dear friend Mr. Thomas Laxton of the Experimental Nursery, Bedford. It was only the other day seemingly that I had an interesting letter from him, making some inquiries about hybrid Tomatoes, Peas, and new varieties of Potatoes specially suited for Ireland, he had asked me to try and report on for him. It is quite a shock to think he is no more. I am sure I express the voice of thousands of my countrymen and women in wishing that long may the memory of so good a man be kept green. If a subscription list is opened with that object I shall be pleased to forward my cheque.—W. J. MURPHY, Clonmel.

WINTER GREENS CLUBBING.

I AM afraid clubbing will be pretty general in winter greens especially Brussels Sprouts and Broccoli. The plants here are in robust health, having grown freely, but they now show signs of distress in places, flagging under a very hot sun. It is getting late now to put out young plants, but something must be done or great loss among the plants will result. I only know of one remedy for plants already affected, and that is to make the ground firm around each plant by thoroughly treading the soil down with the feet, afterwards earthing the plants up the same as Potatoes are earthed in spring. The plants will soon make fresh roots higher up the stem than previously, and take possession of the additional soil afforded them.

This has been an exceptionally dry scason, making the work of growing good Peas and Cauliflowers very difficult, especially in dry soils. If it is difficult to raise these two crops, it is also the plants which are

to supply the needs of the winter months. It is during the time when the plants are in the seed beds - June and July - that clubbing is helped on by sowing the winter greens too soon, and allowing them to remain in the seed beds longer than is good for them. This is not the only cause. Planting year after year on the same ground with no intermediate crop will conduce to clubbing. A change of ground is not always to be had, so that extra attention should be paid to the plants in their young stage of growth. It is very well to select a warm south border for sowing the summer vegetables which are required for early use, but I think it is preferable to make the seed beds for the winter greens in the open garden, and use great care in sowing the seeds, by first taking off 2 inches of surface soil, then well soaking the ground with water, sowing the seeds upon the damp soil, and finally covering with the dry earth which was first taken off, and not watering afterwards. If the seeds be good, germination will be quick and thorough.

While the seedlings are in a very young state is a most critical time for them, as the fly will work havoc in the beds if not guarded against, even after the two rough leaves have appeared. Upon the first appearance of the fly an old herring net should be laid lightly over the bed and eased off the plants every two days. A little anthracite coal ash and soot mixed and dusted over the plants early in the morning while they are wet with dew, will soon overcome the fly, but the herring net itself is distasteful to them. If the plants are not sown too early and placed out before a check to growth occurs, clubbing will be lessened. Where time and space affords transplanting in a young state

is advisable.—G. GARNER, Cadland Park Gardens.

VIOLAS.

THE early part of this year proved a most propitious time for the Viola, and brought it very prominently to the front as a spring decorative plant, and but for the tropical heat of the summer, and the terrible plague of aphis in so many places, 1893 would have been a record year for Violas. Mr. Williamson's remarks last week, page 120, lead me to say a few words, not in criticism, for he does not in the slightest degree attempt to dogmatise, but pleasantly draws attention to the Viola as a charming bedding plant, as it undoubtedly is. I heartily thank him for giving good assistance in still further advocating its value, for it has taken many years to get the plant popular. Of his kindly reference to

myself I am fully sensible.

Only a few days since I was at Umberslade Hall, Warwickshire, where masses of that grandest of all white Violas, Countess of Hopetoun, was in full beauty, planted out in April last in good soil in beds in the flower garden; the plants were robust and simply a mass of fine flowers. My old variety, raised about fourteen or fifteen years since, Dean's True Blue, even now far away the very best blue Viola in cultivation, was just as fine in every way as Countess of Hopetoun, and masses of flower. Both are compact sturdy growers, of the same habit and height, and are very early and continuous bloomers. Countess of Wharncliffe, alluded to by Mr. Williamson, was sent out a few years since. It was raised by Mr. Simpson at Wortley Hall near Sheffield; and it has been reintroduced from a Preston firm under the name of Lord Fitzgerald. This is also similar in habit to the Countess of Hopetoun, but is of a more snowy white colour, and does not open flat as in others; still it is a very effective, free-blooming variety. We have a host of new whites-Sylvia, White Duchess, White Flag, and others some, too, closely like the Countess, but none so good or so valuable.

Those on the look out for sterling varieties for bedding will do well to go in largely for Mrs. Charles Turner, blue purple; William Neil, soft rosy pink; The Mearns, rosy violet with light top petals; Duchess of Fife, white and cream with bright brown margin; Bullion, a grand yellow; The Queen, or Ardwell Gem, pale yellow; Wonder, light yellow; Lady Amory, rich violet with dark top petals; Bridesmaid, very pale primrose. These are only a few of the very fine bedders. We are getting a host of new sorts, many of them great rubbish, but some of exceeding beauty, especially for exhibition, but as valued bedders we must have good habit, telling distinct self colours, floriferousness, good constitution, and early and continuous bloomers.—WM. DEAN, Birmingham.

WASPS.

It should be well understood that some of the remedies advocated for the destruction of these pests, such as cyanide of potassium and advertised wasp destroyers, are most dangerous poisons. The former has a deadly vapour and should only be used with the greatest caution: with the latter, the poisoning of fruit freely exposed is advocated, a most undesirable state of things and only to be resorted to at the last

It is plain that destruction of the nests is the proper way of extermination, but first "catch your hare." It is not everyone who can readily find all the nests about the place even when they are quite When I was a boy, the account in one of Mayne Reid's works of the bee hunters of North America led me to try the same way of finding wasps' nests. Shortly, it consists of watching the direction of flight from two or more spots at a little distance from the infested places, and thus getting converging lines which should lead to the nests. One soon gets accustomed to recognising a wasp from other insects by its flight even some way off. A low place in a hedge will soon give you some lines of flight, which should be followed up; and likely banks and hedges should of course also be examined in the sunshine.

When the nest is found, gas tar seems to me to be far away the best, simplest, quickest, and least dangerous of all modes of destruction. You pour a little down the hole at night, and the nest is destroyed—no fire and no poison—time and trouble practically nil. For pendent nests, the simplest plan seems a shot from a gun at close quarters—blank cartridge will do. Go at night, have your shot, blow it to atoms, and retreat speedily.

At a certain public school, where the boys are freely allowed out into the country, the taking of wasps' nests became a popular diversion; and, before long, pressed by the emulation which is so strong a feature with English lads, it came to be reckoned a shame to take them otherwise than in broad daylight, and with any other weapons besides green boughs and spades. Of course the boys got stung sometimes, but where was the fun if there was no danger? To such a pitch was this chivalrous spirit carried that, on one occasion finding and digging out a small and weak nest, it was decided to carry it home and place it in a convenient and secluded hole where it would not be meddled with, till t was strong enough to defend itself: and this was actually done! Rather absurd, but they were only boys-and young Englishmen!-W. R. RAILLEM.

BARFORD HILL.

THE residence of C. A. S. Ryland, Esq., occupies a delightful position on the summit of one of the many undulating hills for which the varied scenery of Warwickshire is justly famed. Starting from the county town a three-miles drive over a broad level road brings us to the quaint Roman bridge which spans the Avon, and gives access to the pleasant village of Barford, where gay window-boxes, well kept cottage gardens, teeming with brightly coloured flowers, speak volumes for the taste and industry of the inhabitants, and afford a striking example of the rivalry created and the good work done by cottage garden societies, for the excellent condition of these wayside gardens must be attributed in a great measure to the thriving horticultural society of which Barford boasts, and which, thanks to the liberality of the owner of Barford Hill is well supported. Thus far on our journey we have pursued a straight and even course, neither turning to the right nor the left, except to give a passing or a backward glance to some special object of attraction which anon caught our eyes as they turned in rapid succession to the right or to the left. Thus we sped on pleasantly enough till it suddenly dawned upon us that too great a regard for the main road and its diversions had caused us to leave behind the gardens we intended to visit. The turn we should have taken was, however, yet in sight; it was reached again in a few minutes, and we began to pursue an upward course over a road which rises by a series of erratic gradients to the top of Barford Hill. Here we find the entrance to the gardens close at hand, and Mr. R. Jones, the able and energetic gardener, on the spot to welcome us. On entering the kitchen garden the first object to arrest attention was a bed of summer flowering Chrysanthemums, which even thus early (July 28th) were aglow with their golden flowers. Précocité and Flora were the varieties principally grown. Marigolds, Asters, Lobelias, and many fine seedling Verbenas occupied an adjoining border, which faces the gardener's pleasant and commodious residence, at the opposite end of which is a charming verandah entwined with a rich profusion of creepers, a mass of the fine purple coloured flowers of Clematis Jackmanni producing a striking effect.

We next proceed between an avenue of bush Chrysanthemums, which are arranged around the sides of the walks; they are fine plants in splendid health, and will undoubtedly make a beautiful display during the autumn months, as there are 500 of them grown in the bush form; but more of Chrysanthemums anon, when we come to the plants

which are grown for supplying large blooms.

Apple and Pear trees, trained in pyramidal form, are planted a few feet from the edges of the walk. Nearly all of these are this year carrying heavy crops, notably two fine trees of Pitmaston Duchess Pear, which have numbers of very large fruits. Mr. Jones attributes his success to the practice of keeping the branches thinly disposed. In a newly made kitchen garden a long avenue of standard Apples, Pears, and Plums have been planted; these have made capital growth, and give promise of supplying abundance of choice fruit in a few years, as the most approved varieties have been selected. Apricots on walls have very heavy crops, a general experience in the neighbourhood. Large quantities of vegetables are required, and every effort is being made to meet the demand, which is maintained at present under somewhat adverse circumstances, as the soil is cold and heavy. Plenty of rough strawy manure is, however, dug into all vacant quarters during the autumn months, when the land is thrown up roughly, so that the action of the frost may pulverise it. This course of treatment will assuredly soon work a great improvement in the mechanical condition of the surface soil, which is already rich in chemical constituents. Splendid rows of Runner Beans, fine heads of Cabbage, heavy solid bulbs of Onions, and sturdy Beet all attest that the soil is productive, notwithstanding the fact that much difficulty is experienced in working it in the spring and establishing young crops. I noticed several rows of Windsor Castle Potato were being grown, and was curious to see a sample of the tubers. On lifting several roots these proved to be wonderfully even in size, having every appearance of a good table variety, for which purpose Mr. Jones speaks highly of it. Beauty, as well as utility, is studied in the kitchen gardens at Barford Hill. walks are formed of grass kept closely cut, and bordered on each side with herbaceous plants and annuals, which at the time of my visit were wonderfully effective. Double Zinnias and East Lothian Stocks were

especially good; the latter are sown early in the spring, and the majority of them flowered during the ensuing summer.

Glass structures are numerous and arranged in a somewhat scattered form in various parts of the kitchen garden. In the range which we first enter the houses have three-quarter span roofs. and finish these structures are admirable. There is, however, one drawback in connection with them—the framework is of iron, and those who have had experience with glass houses of this description are well aware what great watchfulness and care are necessary in the matter of ventilation and damping to counteract the great fluctuation in temperature for which hothouses constructed of similar materials are noted. It may therefore be readily understood that they do not find favour at Barford Hill, especially after the recent tropical weather. In the stove we found a clean healthy collection of plants of the right size for decorative purposes, for which they are in great demand. The central bed was occupied principally with Palms and Crotons, the latter being well coloured. C. Weismani, angustifolius, Chelsoni, Victoria, Disraeli, Thompsoni, and many other varieties were well represented, the wall of the bed being completely covered with a trailing mass of Panicum variegatum, while on the roof a thinly trained plant of Bougain-villea glabra bore imposing panicles of rose-coloured bracts, a useful shelf on the back wall being filled with Calanthes and other plants. The vineries are not numerous, being only two in number. Considering the Vines in these are old, an additional house or two in this department would be a great advantage, as without the loss of a crop it is a difficult matter to plant young Vines. An inside border has, however, been made, and some young Vines recently planted, which will next year be cut down to within a few inches of the soil. Mr. Jones, being an old "Floors Castle" man, may be depended upon to do the best that can be done under the circumstances. The old Vines are carrying a heavy crop of excellent Grapes just the right size in bunch for table use. Gros Colman, Gros Guillaume, Black Hamburgh, Buckland Sweetwater, and Muscat all growing in one house. At the end of the range is a lofty conservatory, where many good specimens of Pelargoniums, Fuehsias, and miscellaneous plants were growing. In this house the bulk of the Chrysanthemums are flowered; although some of the plants must necessarily be at a great distance from the glass, it is on the whole a capital place for them, being a light airy structure, just such a one as Mr. Molyneux would have liked for his plants of Madame C. Audiguier when he used to grow them 12 feet high. Near by we enter a capital range of Peach houses, the trees being trained on a curved trellis in the front, others occupying the back wall. Fine fruits of Royal George Peach and Victoria Nectarine were still hanging in one division. In the others the trees were clean, healthy and vigorous. Several good span-roofed plant houses have recently been built. In one of these we found a splendid collection of seedling tuberous Begonias, the plants were well grown sturdy examples, and made a fine display. One variety in particular was noted for its enormous well shaped flowers, and with judicious hybridising should prove the parent of a splendid race of

A start has been made with Orchids, a couple of houses being principally devoted to them. The majority of the plants are small, having only recently been obtained, but they are clean and healthy, appearing to be quite at home in their abode. A well-marked variety of Oncidium Krameri was in full beauty, as were several good spikes of flower among the Odontoglossums. The collection will in a short time be a good one, as choice species and varieties are being continually added to it, while those already obtained are making good progress. Another range of houses is devoted to the growth of Melons, Pines, Ferns, with batches of Cyclamen growing on shelves near the glass, a cool structure adjoining being used for forwarding plants just coming into flower preparatory to being taken to the mansion or conservatory proper. Near here are plenty of useful pits in which Cyclamen, Primulas, and Cinerarias are in capital condition. Zonal Pelargoniums and Bouvardias are grown extensively for winter flowering. These were looking remarkably well, and will prove quite a sheet anchor during the dull season. Much more might be said on this subject, but I must pass onward, as there are other things to tell of.

Chrysanthemums, of which 850 are grown on the large bloom principle, demand notice: As we approach them it is not difficult to see that our guide is a Chrysanthemum enthusiast. The light kindles in his eye, and his countenance is aglow with animation as we obtain a full view of his "Chrysanthemum field," for indeed such it A splendid position in a wide open spot has been selected for them. The plants are arranged in rows running east and west, with some 4 or 5 feet of space between each row. Every facility is thus given for attending to the wants of each plant, and also for thoroughly examining them. This we proceeded to do. Passing along every row of plants we carefully note their condition, looking out for old favourites, and generally finding them as well as nearly all the new ones of proved mcrit. G. C. Sehwabc, Viscountess Hambledon, Mohawk, Col. W. B. Smith, Lord Brooke, Middleton Clark, and Beauty of Exmouth are represented by several good plants. All are in capital health, and are remarkable for the firm, hard growth made; there is no approach to grossness, and the leaves are as thick and leathery as it is possible to have them. They are now taking on that bronzy tint which is a sure indication of ripeness consequent upon exposure. Like many other cultivators this year Mr. Jones finds the crown buds formed too early. In nearly all instances they have therefore been removed and successional ones promise to come quite soon enough. Many men, especially gardeners, have a knack of showing visitors the best last. Such was our experience

in this instance. Good as the plants already seen were, the last row surpassed all others. Etoile de Lyon and Miss Lilian Bird were the varieties which held the post of honour. These were exceptionally strong, yet hard, and without doubt well ripened, and I fancy it will be difficult to meet with better plants. With a lingering look we leave them to hasten to the pleasure grounds before the shades of evening fall.

Around the outskirts we follow a pretty winding walk, and wend our way among some artistically arranged rockwork containing Yueeas, Ferns, and other suitable plants. Catching a pretty glimpse of parklike seenery, we cross the green sward, near large beds of vigorous Roses, and wend our way to the terrace around the mansion. Below we have a series of oblong beds planted chiefly with Pelargoniums, Lobelias, and Pyrethrums. Black Douglas is a bronze tricolor very popular here, where it grows and colours wonderfully well. One unique bed was filled with this variety and edged with a broad band of Manglesi. Others were masses of rose, pink, or scarlet provided with suitable edgings. Near the eentre of this line of beds were two grand Golden Yews, perfect specimens some 10 or 12 feet high. The whole of the pleasure gardens were in fine trim, tidiness and good order being apparent on every hand. Following the terrace walk we pass to the conservatory adjoining the mansion. Here a fine plant of Taesonia Van-Volxemi covers the roof, the shoots being allowed to drop loosely from it, must have a fine effect when in flower. Palms and other fine-foliaged plants luxuriate in the central bed, while a good selection of flowering plants brighten up the side stages.

We now retrace our steps to the terrace walk in order to take a lingering view of the fine seene before us. Our eyes first rest upon the brightly coloured flower beds beneath, then wander to the cool refreshing green of a distant belt of trees; this belt is broken in its outline, and between the serried lines shine the bright waters of Shakespeare's "flowing Avon." From the water to the tree tops the space widens, as if to give a clearer view of the stately tower of St. Mary's church at Warwiek. Still another glimpse of the Avon is seen in the opposite direction, and all around the beauty of the undulating ground defies my power of description; but it requires no great gift of imagination to arouse the inward conviction that for quiet home-like beauty the seene before us will not be easily surpassed. Both "the Squire" and Mrs. Smith-Ryland are ardent lovers of horticulture, who take great interest in their gardens, and provide with a liberal hand the means for keeping them in good condition, and in Mr. R. Jones they have an active and intelligent gardener, whose heart is in his work, and who thoroughly appreciates the liberality of his employers.—H. D.

APPLES FROM THE HIMALAYAS—HEAVY RAINFALL.

I send you two Apples for the favour of naming. I purchased Dr. Hogg's "Fruit Manual," and I have been trying to name my Apples by it, but I have not been very successful. Perhaps English Apples vary a little when grown here, as our elimate on the Himalayas is different from yours. Our elevation is 6500 feet. Last year we had no rain from February to July. This year during the cold weather (from the end of January to the beginning of March) 15 feet of snow fell. All the spring and till the 18th June rain constantly fell. At this time the monsoon commenced, and the fall was:—

June .. 18 19 20 21 22 23 24 25 26 27 28 29 30 Inches.. 0'84 3'62 1'56 1'17 0'06 3'24 0'92 0'18 0'53 2'97 2'13 1'23 1'26

The two Apples I send have not had much sun to colour them. In ordinary years they are much redder. Are they both the same? They look so, but all on one tree have the stalks short and on the other the stalks are long. The first tree is a compact grower and the other is a straggling one. If you could name these for me it would help me in working with Dr. Hogg's book.—Angus Campbell.

[We regret very much that the two Apples arrived in a completely rotten state; in fact, a shapeless mass, with not a vestige of character left to guide us in their identification. If the stalks of the fruit from one tree are short, and the other long, and the trees are markedly dissimilar in habit, the varieties may be regarded as distinct.

The chief external fixed characters to be noted in seeking for the names of fruit are:—Stalks, short or long, stout or thin, inserted in deep or shallow depressions; eye, large or small, open or closed, with broad or narrow segments, flat or erect, set in a deep or shallow, smooth or plaited, basin. Yet we have many specimens sent to us without stalks, and the eyes spoiled by pinning the numbers in them. The size, shape, colour, and peculiar markings of the fruit have also to be observed, but these are, so to say, moveable factors as influenced by climate or other disturbing cause.

The internal characters to be noted are the position of the dried stamens in the tube—namely, marginal, median, or basal; the tube itself as to form—conical or funnel shaped; and the carpels or core. Illustrations of all these distinctive marks are given in the "Fruit Manual," and they become clearer by study and comparison with dissected fruits:

Our readers, and they are many, who are interested in the question of rainfall, which they earefully ascertain, will note the Himalayan downpour represented by 19.61 inches on thirteen days in June, no loss than 6.86 inches falling on two days, but it will be observed there was no rain from February to July, but there was plenty of snow in March. We must not consider our climate, with all its drawbacks, the worst in the world.

BATLEY AND DISTRICT CHRYSANTHEMUM SOCIETY.

WE have received the schedule of the forthcoming show of this Society, to be held on November 11th. In the principal open class for twenty-four Chrysanthemum blooms, twelve incurved and twelve Japanese, in not less than nine varieties of each, a first prize of £5 is offered, to which will be added the Society's silver cup, value £6 6s., also the National Chrysanthemum Society's silver medal. Mr. Allen Hall, 4, High Street, Batley, is the Secretary.

HONOURS FOR A CHRYSANTHEMUM RAISER.

The readers of the Journal of Horticulture are, no doubt, aware that on the Continent it is customary for the Governments of various countries to recognise special service in horticulture by conferring decorations upon those who are considered worthy. Many eminent French, Belgian, and other nurserymen have been the recipients of the Legion of Honour, the Order of Leopold, and the Merité Agricole, without naming other orders less familiar here. Notwithstanding the enormous advantages that must have accrued to French horticulture by the labours of such Chrysanthemum specialists as MM. Délaux, Louis Lacroix, De Reydellet, Dr. Audiguier, and M. Boucharlat, whose efforts have so materially advanced the cause of Chrysanthemum culture throughout Europe and America, we do not remember ever yet seeing any announcement of their work being rewarded in this way. It is pleasing, however, to record that M. Ernest Calvat, a raiser of quite modern times, has just been appointed a Chevalier of the Order of the Merité Agricole. M. Calvat's seedlings have been shown in England with conspicuous success during the past two or three years, and are, it will be remembered, chiefly characterised by their heavy massive blooms of the Japanese incurved type. He is the only French exhibitor that has successfully obtained first-class certificates of the National Chrysanthemum Society, and he is to be congratulated on having so soon won distinction in a way that is dear to the heart of every Frenchman.

CHRYSANTHEMUMS IN NEW ZEALAND.

A CORRESPONDENT writing from Christchurch (N.Z.) reports that the frozen blooms sent out to the Wellington Horticultural Society by the N.C.S. have recently been exhibited at Christchurch also. He adds that the lovers of Chrysanthemums have good reason to be proud of the steady progress that is being made in the cultivation of that flower in the colony. The localities where the leading growers are to be found are Auckland, Napier, Wellington, Nelson, Christchurch, Timaru and Dunedin, and besides these places there are other districts in which attempts are being made to encourage and extend a taste for the cultivation of this popular favourite.

In Christchurch alone there are several very able cultivators who have demonstrated by the excellence of their exhibits that they thoroughly understand the art of the big bloom method. Most of these, however, are amateurs who, being employed in shops and offices during the day, find an enjoyable recreation in growing the Queen of Autumn as a hobby and relief from business cares. The trade generally have not yet found time enough to devote themselves to this phase of Chrysanthemum culture, but are contented to stage mixed exhibits at the shows. Among new varieties Viviand Morel, R. Kingston and W. Tricker have excited most attention and been much admired. The Christchurch Chrysanthemum Show, held May 11th and 12th last, was a remarkably good one in spite of the extremely unfavourable weather that preceded it. In fact all over the Australasian colonies the weather just previous to the Chrysanthemum season seems to have been exceptionably wet. In various parts of New Zealand there are growers busily engaged in raising new seedlings, and we have no doubt but that something will be heard of them here in England before very long.

AMERICAN CHRYSANTHEMUM SOCIETY.

WE have not hitherto been able to record much concerning the progress of this Society, for its chief work seems to have been confined to the registration of the names of new varieties. Founded about four years ago, there has never to our knowledge been any show held under its auspices, and we were beginning to wonder whether it had ceased to exist. A friendly correspondent in the States has, however, just sent us a little pamphlet, entitled "Report of the Committee on Classification of Chrysanthemums before the American Chrysanthemum Society," which shows very clearly that the Society is attempting a useful work. The report is practically a catalogue of the varieties grown in the States drawn up in a form that has no doubt been suggested by the catalogue of the National Chrysanthemum Society of London. There are select lists wholly devoted to American secdlings and importations, together with an A.B.C. list at the end of the work. The catalogue is neatly printed and contains thirty-seven pages, and does not state upon it whether it is for sale or only for private circulation among the Society's members.

YOKOHAMA GARDENERS' ASSOCIATION.

This Association, which is a purely commercial body, have issued an illustrated catalogue this year of fruits, shrubs, and flowers. Among the

coloured illustrations are seven of new Chrysanthemums. They are fairly well executed, but the types of flowers depicted do not differ in any essential points from those already in cultivation here.—P.

CHRYSANTHEMUMS-BUD FORMATION.

JUDGING from the notes which are weekly appearing in the Journal Chrysanthemum growers and exhibitors are evidently much concerned over the abnormally early appearance of crown buds. The cry seems to come generally from growers in the south, and I feel certain that those living in the midland or northern counties will this year have a great advantage over their southern friends in the production of blooms for exhibiting at the earlier shows. During ordinary seasons I find crown buds show themselves fully a fortnight later in this district than they do in Wilts or Hampshire, and during a season like the present the one advantage thus gained is great indeed, for provided crown buds are taken at the right time the flowers resulting therefrom generally win when pitted against others from terminal buds, excepting the cases of special varieties.

I have comparatively few buds appearing too early this year. Violet Tomlin, Miss Haggas, Mons. Bahuant, Princess of Wales, Prince Alfred, and Lord Wolseley from autumn-struck plants showed their first crown buds about July 25th, while spring-struck plants are (August 12th) showing them now. The former were removed, the latter are being taken. Several plants of the Queen family showed buds during the first week in August; they were, however, exceptions of the bulk of our plants, the buds are now visible, and they could scarcely have appeared at a more opportune time. Many of these plants were not struck till the last week in January. They are now from 4 to 5 feet in height, the stems being very thick and hard at the base. It seems to me that this spring propagation is a point which will in the future receive great attention, as its effect in delaying the formation of crown buds is a matter of vital importance to Chrysanthemum growers, especially in the case of early varieties when grown in the south of England. If those who send notes on this subject to the Journal will record the difference noted between autumn and spring-struck plants, their contributions will be extremely valuable.

Turning to Japanese varieties. It is curious to note that Boule d'Or showed buds about the usual time, during the first five days of August. Etoile de Lyon from autumn-struck plants, July 22nd; from cuttings inserted at the end of January, buds showed from August 1st to 10th. Mrs. F. Jameson, W. W. Coles, from autumn-struck plants, showed buds July 29th. Viviand Morel, from cuttings put in at the end of January, showed buds about the same date, a few of these were taken, the others removed. W. H. Lincoln, F. Davis, Sunflower, W. Tricker, and Mrs. E. Beckett, from cuttings inserted at the same time, preceding variety showed buds from the 1st to the 12th of August. Avalanche is the only Japanese variety which, with me, produced the whole of the crown buds too early to be taken. On plants of many other varieties not specially mentioned crown buds are now daily becoming visible, and by the 20th of August I hope to have every bud taken. Unless we are favoured with an exceptionally warm autumn I believe the buds taken on the dates above given will produce the finest flowers for exhibiting during the first three weeks of November.—H. Dunkin, Castle Gardens, Warwiek.

NOTES FROM BRISTOL.

(Continued from page 123.)

HENBURY HILL.

THESE gardens are in charge of Mr. Thomas Smith, one of the most genial and practical of gardeners. Mr. Smith has acquired quite a local fame for his Tuberous Begonias, which after years of careful selection and cross-fertilisation is now equal to almost any of the best trade collections. His ideas, however, do not bind him to any hard and fast rnle as to form and character in either plant or bloom. Equal pleasure is derived from the drooping as from erect standing bloom, and his standard of excellence do not lead him to discard all but smooth petalled flowers. He is fond of form and variety.

In the stove are healthy plants in variety, and among them I noticed some promising seedling Crotons. A batch of Adiantum farleyense, occupying a moist corner, seems quite at home, and furnish a good groundwork for displaying Calanthes in flower to the best advantage. Orchids share a portion of this house, Cypripedium Sedeni being represented by a good healthy plant which had just finished blooming. Dendrobiums in variety, Phalænopsis, one plant of P. amabilis having a spike of flowers now open, with other species and varieties too numerous to mention. Of Freesias there were a good batch of very dwarf plants, which will make a good display later on. Mignonette in the same house is a partial failure, the first time for eighteen years, this being attributable partly to a change in their autumn quarters, this and other instances convincing Mr. Smith that plants have a partiality for certain positions. Mr. Smith is an adept with Mignonette, one standard sort which has been in cultivation now some few years being raised by him.

Eucharis plants standing over a tank of warm water in another house have flowered three or four times during the past twelve months, and at one time these were so badly infested with mite that drastic measures had to be adopted to stamp it out. The leaves were cut away and the outer skin of the bulbs removed and thoroughly washed with warm soapy water. Following this they were placed in the pots they now occupy, and plunged at once into a hotbed, and from that time no mite

has been seen, and their health and vigour now is all that could be desired. In the fernery are some interesting plants, but so many of the deciduous varieties being just now at their worst, a good estimate of the summer beauties of the house could scarcely be formed. Some plants of Lastrea lepida, Adiantum reniforme, Asplenium viviparum, and Nephrolepis pectinatus struck me as being very distinct and useful for decorative work, the latter particularly so when occupying small pots. Bouvardias are splendidly grown at Henbury Hill, large bushes in 8-inch pots still flowering freely, and have done so since the autumn. Carnations are grown in goodly numbers, and a local seedling named Cleeve Hill Beauty is much prized for its free blooming habit, bright rosy coloured and shapely blooms, and good constitution. These are planted out in summer, lifted and potted again in autumn, a system These that secures fine plants and abundance of blooms for cutting. The popular Miss Jolliffe has a fitting companion in La Niege, a dwarf growing white variety of much the same habit and size of flower.

Good Grapes have been grown for some years in these gardens, and the promise of future crops is most assuring. One house is filled with a single Vine of Black Hamburgh, which is many years old, but few young ones could excel it in its large and finely coloured bunches annually produced, or its healthy and vigorous growth. Peaches are thinly trained, Mr. Smith believing in having just sufficient wood to secure a good crop and no more, this rule being notable both indoors and out. It would be better if such a practice was more common in gardens, for then the trees would get the benefit of sunshine and air to mature the current growth with greater certainty.

In the vegetable garden is a good breadth of winter Spinach in two varieties Sutton's New Long Standing and the ordinary prickly. The superiority of the new one was clearly demonstrated by the stouter and much larger leaves, and is less injured by frost. This, when better known, should become a standard sort both for summer and winter growth. Late Queen and Sutton's Bouquet were among the hardiest of the Broccoli, neither of these apparently having suffered by the late severe weather. The early winter sorts were nearly all killed.

MALMAINS, FRENCHAY.

This is the residence of Captain Belfield, and where plants, Ferns, and Orchids are so well grown by the able gardener in charge, Mr. W. Rye. The collection of some fifty plants of Todeas superba and pellucida are such that can be found probably nowhere in the kingdom. They are magnificent, and beyond all power of description. The heads measure 5 or 6 feet in diameter, and many of the root stems stand 3 feet above the large pots in which they are grown. They were, I believe, collected and brought home by Captain Belfield himself some years since, and their present condition is such that must give him immense satisfaction. Every plant is in the best of health, yet during the late severe weather frost enveloped their fronds in ice on many occasions, and no attempt is made to prevent such an occurrence; one half of the house, which was added some few years since, having no hotwater pipes, and a 3-inch flow and return is insufficient to keep out frost in the older division of the house. During the summer the roof is heavily shaded, and the plants receive a syringing once or twice a day, so that the fronds are kept uniformly moist. Very rarely is water needed at the roots, or rather applied to the soil, the dense moisture prevailing at all times sustain them perfectly.

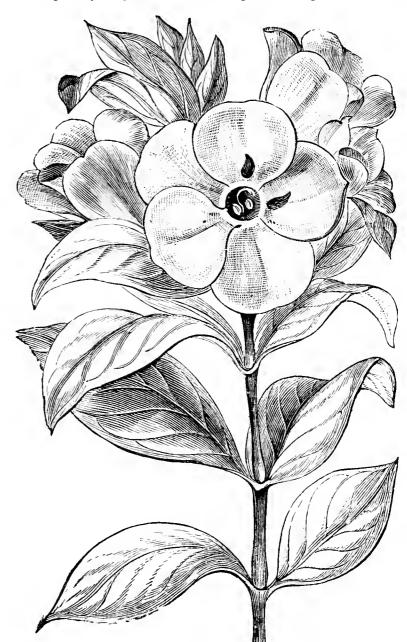

In the tall Palm and Fern house adjoining are many fine specimens, some of these, too, like the Todeas, having been brought home by Capt. Belfield. Cyathea dealbata stands some 14 feet in height. Cyathea medullaris and Alsophila excelsa, too, are stately specimens. Arcca sapida is a truly grand plant, reaching, I should say, 18 feet in height. The Date Palm, Phœnix dactylifera, Chamærops excelsa, and Kentia Fosteriana adding to the tropical forest-like aspect of this noble structure. Some tall Tree Fcrn stems are clothed with the creeping rhizomes of the Davallia canariense, which in summer must have a pretty effect. In the stoves are many fine specimens of Anthuriums Andreanum, Ferierense, and crystallinum, Crotons, Stephanotis, Allamanda nobilis, a fine plant; Clerodendron Balfourianum, Bougainvillea glabra, and Eucharis. These last named do uncommonly well, and are seldom out of bloom. They are growing in wide but somewhat shallow pots, which seem to suit them admirably, as do also the house and treatment they

Orchids are grown in large numbers and variety, and is another feature of these gardens. Cymbidium arvense had several spikes of its sweetly scented and curiously coloured spikes. Epidendrum fragrans, too, was furnished with some spikes of their highly interesting and pretty flowers. Nepenthes Mastersiana and Hookeriana were growing well in suspended baskets, and had several of their quaint pitchers of Dendrobium speciosum was just opening its pretty yellow and spotted flowers on semi-drooping spikes. This is a noble plant, which, when in full bloom, must be very striking. D. Pierardi will be later on a sheet of blossom, several strong plants being suspended from the roof. Calanthe Veitchi has been, and still are, remarkably fine; and Cypripedium insigne and Maulei fill several large pans. A strong piece of Cypripedium lævigatum was noticeable, as also was another healthy one of C. porphyreum. Cœlogynes are numerous and well furnished with plenty of strong flower spikes. Cattleya citrina on blocks does particularly well. C. Mendelli, C. Mossiæ, Lælia anceps, and L. purpurata, Odontoglossums grande, citrosmum, and C. roseum, Vandas, Angræcum sesquipedale, Aerides, Brassia verrucosa, and hosts of others furnish a constant supply of bloom in varying quantities at all

Grapes and Peaches are well grown, the latter gaining the leading prizes at local shows, which is the best proof of the skilled attention given. Outdoor fruits are limited in extent, and the same may be said also of vegetables, but sufficient are grown to meet the demands of the house. The place generally reflects much credit on Capt. Belfield, who is a keen horticulturist, and on his gardener for its excellent keeping .-- W. S.

BARLERIAS.

A SCOTTISH correspondent wishes to know something about Barlerias, which he has not seen mentioned in the Journal. They have all the same been mentioned. They are tropical shrubs, B. Gibsoni being perhaps one of the most useful for decorative purposes. The figure shows a flower spray. It is a next branching shrub, attaining a height of several feet; but handsome well furnished plants some 2 or more feet high may be grown from cuttings in a single season; and as

TIG. 24.—BARLERIA GIBSONI.

these not only bloom freer than old plants, but produce the finest flowers, there is no advantage in keeping the old ones. The leaves are upwards of 3 inches long, ovate-lanceolate and acuminate, deep green above, glaucous below, and somewhat coriaceous in texture. Flowers funnel-shaped, produced in terminal and axillary spikes near the ends of the branches; lobes spreading, colour pale purple, the two upper lobes having a dark purple blotch in the centre. It flowers in midwinter. Native of Central India.

PROPORTIONAL PRIZEGIVING.

HAVING for a long time been contending, and, I think, almost alone, in favour of the principle of awarding prizes at flower shows in proportion to the respective merits of the selected exhibits, I took very much interest in the class, the first, I think, of its kind, set apart at the recent Carshalton Show, in which the principle of proportional prize-giving was adopted. Now I find from your report of the particular class—nine kinds of vegetables—that the difference between the first and fourth of the selected entries was covered by only four points, whilst the first was so near to the second as to be only half a point better, and the third was but one point below the second. Practically the difference of the four lots were about 1, 2, 3, and 4 per cent., mere

trifles indeed. But then these trivial differences in merit are really great ones when the old system of prizegiving is practised. Here was a sum of £5 set apart for the class to be divided into four prizes. Ordinarily the prizes would have been 40s., 30s., 20s., and 10s.; the second prize being 25 per cent. less than the first, the third prize 33 less than the second, the fourth 50 per cent. less than the third, and 75 per cent. less than the first. Now, as the points of the selected four when most carefully judged stood at $54\frac{1}{2}$, 54, 53, and $51\frac{1}{2}$, can anyone assert with any degree of justice that under the ordinary method of giving prizes the merits of these four collections would have been fairly dealt with? It would be too absurd to say so. I should very much like to learn how the £5 were ultimately apportioned; but having regard to relative merits, as shown by the pointing, I make the amounts to befirst, 28s.; second, 27s.; third, 25s.; and fourth, 20s.—A. DEAN.

Other prizes were awarded for collections in which there was a greater falling off in points, but the particulars given below were not previously obtained. At the first pointing two of the collections were equal, and it was only on a second rigid examination that a slight difference could be discovered. The system is a just one, but its general adoption would necessitate an increase in the number of judges at most, if not all, shows.]

-G. W. CUMMINS.

WOODHATCH, REIGATE.

BEING at South Park, Reigate, the other day, and close to the beautiful place of the Treasurer of the Gardeners' Orphan Fund, Mr. T. B. Haywood, I gladly availed myself of a kind invitation from Mr. Salter, the esteemed gardener, and a spare couple of hours, to visit these grounds. Their great feature to me is found in the remarkable neatness, the very high order of keeping, to use a common term, found in every direction. I think I have never seen a tidier garden, or one in which order so thoroughly prevails. That may to some extent be due to abundance of help. I do not know, but certainly very much also is due to the excellent training in these elements of garden excellence Mr. Salter has had. I do not propose to outline or describe the place except to say that a large portion of it is very close home and compact, especially so is that the case with the glass department. But such parts as vegetables, Potatoes, and hardy fruit are in different places, and some of them remote. Even the Roses, of which there are many grown, are close to the farm, some distance from the house, but then it has been needful to find for them there a soil that is suitable for their requirements.

Two special kinds of plants are grown at Woodhatch in great quantities. These are Orchids and Chrysanthemums, both wonderfully Mr. Salter took me through house after house, each devoted to Dendrobiums, Odontoglossums, Cattleyas, and so on in their respective sections, all in the most admirable condition, clean beyond description, and the plants in perfect health. Perhaps it is not at all difficult to manage Orchids well when you have plenty of good houses and assistance, but I have seen many very much bungle at it all the same, and have been very glad to get away from them. It is far different at Woodhatch, where, whilst just now few of the plants are blooming, it is a rich treat to look through the houses, but in the spring it must be indeed a delight. Then out in the open there is a wondrous lot of Chrysanthemums. Mr. Salter has a thousand plants of many sorts in every section, and it is not possible to withhold a warm tribute of praise for their splendid condition. The Reigate district has considerable fame for the production of high class Chrysanthemums, due to some extent perhaps to the excellent locality, but chiefly, of course, to skill attained through frequent severe competition at local shows; and even Woodhatch finds formidable competitors at Great Doods, where Mr. Brown practises so well, and in Messrs. Riches, Bailey, Hayter, and others. How like the shepherd who so well indicates the members of his flock by their faces does Mr. Salter point out the Morels, the Smiths, the Queens, the Avalanches or Sunflowers and numbers of others by their leaves alone. Every one is known, and a beautiful study does this class of plant knowledge present. There are no insects on the plants, and no rustiness about leaf or pot. not be easy to detect that the plants had been watered, and but that they were properly moist, as all over the area on which they stand, a fine rake is run and footsteps obliterated after cach watering.

In one long lean-to house there is a brilliant lot of double and single Begonias, and in another similar house a fine collection of bush Fuchsias. On the back wall of both houses is a fine lot of Peaches and Nectarines, doing capitally. There is in one of the double Begonias a sort of departure from the normal type, as the flowers have much the shape and form of a Cactus Dahlia. Anything which looks like a break from the big rotund type of flowers may well be regarded with interest. The chief Tomato grown here is Hepper's Goliath, a very old variety

relatively, but at Woodhatch it is a truly enormous cropper. The fruits of the largest arc rather sutured, the smaller ones of excellent form, but the crop could not be excelled. The plants, trained up under a sloping roof, are planted in a somewhat narrow shallow bed of soil, whilst root room seems conducive to coarse growth and certainly the finest fruit crops are got from very limited soil beds. The newer forms of the now popular Streptocarpus are grown here in Mr. Salter has been intercrossing to secure, and with much success, finer blooms. Some, too, arc of rich hues of colour, whilst now so beautiful it is very obvious that there is still great room for the production of greater variation in colour of the flowers.

A lovely Antirrhinum, yellow and red, a wonderful bloomer, is a striking feature in the open borders. All kinds of hardy plants are well grown, and indeed they are greatly encouraged here, where so much of glass does not by any means produce insensibility to the beauties of hardy outdoor plants. The crop on Apple, Pear, and other fruit trees is a heavy one, but tomtits and wasps are giving great trouble. The district is one essentially favourable to fruit production, but it is evident that where there is practical knowledge of tree

requirements, by far the best results are secured.—A. D.

HORTICULTURAL SHOWS.

LEICESTER.

THE annual Show was again held in the Abbey Park on the 8th inst. and as usual attracted an enormous crowd of people. Upwards of 12,000 generally attend, and this year that number must have been much exceeded. Horticulture is encouraged very much by the Corporation, especially among the working classes. One striking evidence of this may be seen in the large number of allotment gardens close to One striking evidence of the town. Another is the beautiful Park where the Show is held yearly, the profits of which are devoted to its maintenance; and not the least of all is the gratifying sight of the garden produce in the cottagers' tent, many of whom would stand a good chance in the professionals' class. The flower beds and park generally looked remarkably well, but one could easily see Mr. Burn has had some hard work this hot, dry season, the whole of the soil being mud from the river, which is not a

good staple for a dry season like the present.

The groups of plants were arranged in the centre of the new show house, a recent addition to the park, the cost of which was defrayed by the flower shows, and amounted to £700. This is a famous place for Chrysanthemums in the winter, of which a fine lot were in preparation near at hand, and looked very promising. The first prize for a group of plants was awarded to Mr. J. Smith, gardener to Mr. S. Bennett, who had clean well-grown examples of Crotons, Drackenas, Alocasias, and Chrysanthemums, lightened by good plants of Eulalia japonica variegata. Second, Mr. G. Barry, gardener to Mr. H. Snow, whose group was rather heavier in appearance. Third, Mr. W. Calvert, gardener to Mr. G. Oliver, the arrangement being better than No. 2, but the plants not so Zonal Pelargoniums lined the sides of this house in conjunction with Begonias and other plants, making an effective display. A novelty in the shape of three bouquets immersed in water under glass shades attracted attention, as exhibited by Mr. H. Smith. The specimen stove and greenhouse plants were arranged in an adjoining house. Mr. W. S. Bolton, gardener to W. Billson, Esq., was awarded the first prize for good specimens, including Allamanda Hendersoni, Plumbago capensis, Bougainvillea glabra, and others. Second, Mr. W. Calvert. For six exotic Ferns Mr. J. Smith was first, showing a fine Adiantum farleyense, Davallia canariensis, D. Mooreana, among other good specimens.

The fruit classes were keenly contested. The first prize for a collection of eight dishes was won by Mr. Goodacre, gardener to the Earl of Harrington, Elvaston Castle. The fruit was good and well staged. Black Hamburgh Grapes were fine in colour and bunch. Muscat of Alexandria good, as was the Madresfield Court. An excellent Queen Pine, Best of All Melon, Nectarines, Peaches, and Apricots completed the collection. Second, Mr. McIndoe, who showed fine fruit, but not so fresh in appearance. His collection contained fine bunches of Black Hamburgh Grapes, a large bunch of Bananas, and very fine Pitmaston Duchess Pears. Third, Mr. J. Read, Bretby Park. In the collection of four dishes there was a very strong competition. Mr. Goodacre was again placed first, showing very fine Muscat Hamburgh Grapes, a Melon, Nectarines, and Peaches. Second, Mr. W. H. Divers, who lost a few points with Grapes, but was much in advance with Peaches and Nectarines. Third, Mr. McVinish. Fourth, Mr. McIndoe.

Grapes, Muscat of Alexandria, first, Mr. McVinish, good bunches, fairly coloured; second, Mr. McIndoe. For any other white Grape, Mr. Reed was first, showing Cannon Hall, good in bunch and berry, but deficient in colour. Black Hamburghs, Mr. McVinish, good in all points; second Mr. I Cooloure with good hamburghs and hamburghs. deficient in colour. Black Hamburghs, first, Mr. McVinish, good in all points; second, Mr. J. Goodacre, with good bunches, not so perfect in colour. For any other black, Mr. W. Messenger was a good first with Gros Maroc, grand berries and well coloured; second, Mr. W. G. Adams. Peaches, first, Mr. W. H. Divers with Crimson Galande, fine in size and colour; second, Mr. McIndoe; third, Mr. McVinish. Nectarines, first, Mr. W. H. Divers with a fine dish of Dryden; second, Mr. J. H. Goodacre; third, Mr. J. McIndoe. Apples were a large class, and some very fine examples were shown; small fruits and Plums also brought a large number of entries large number of entries.

There was strong competition in the open class for a collection of twelve kinds of vegetables. No less than nine lots were staged, and all good. Mr. Garraway, Bath, took first with a superb collection cortaining Conference Tomatoes, Telegraph Cucumbers, Eclipse Cauliflower, White Spanish Onion, James' Intermediate Carrot, White Plume Celery, Garraway's Surprise Runner Beans, a splendid dish, Telephone Peas, Snowdrop and Masterpiece Potatoes, White Stone Turnip, Pen-y-Byd Marrow, the whole neatly set up with Parsley and coloured Carrot leaves. Mr. McVinish was second, Mr. R. Shaw third. The single dishes of vegetables were strongly contested in most instances, the quality of the exhibits being remarkably good for the season.

A large number of Roses were staged. In the class for thirty-six blooms Messrs. Cocker won the first prize with highly coloured flowers; second, Messrs. Croll, Dundee; third, Messrs. Harkness & Son, Bedalc. With twenty-four varieties the prizes went to the same exhibitors in the same order. For twelve of one variety Messrs. Cocker were first with Horace Vernet, Messrs. Harness second with Mrs. J. Laing. Wreaths and bouquets made a very interesting show, Messrs. Perkins taking the chief prizes, Mr. Woodcock also securing a good share.

Among exhibits not for competition, Messrs. Laing of Forest Hill staged a fine group of new and interesting plants, and very fine Begonias. A new Carnation attracted much attention in this collection. It is called Stanstead Surprise, and was awarded a first-class certificate. Saxifraga sarmentosa variegata, Sibthorpia variegata, Begonia Arthur Malet, Campylobotrys Ghiesbrieghti variegata were among the most noticeable plants in this group, which was awarded a gold medal. Messrs. Williams of Holloway had a fine group of plants, which also received a gold medal, and contained many choice Orchids and ornamental foliage plants, among which Cattleya Dowiana. Cypripedium Morganæ, Sarracenia purpurea, Sonerilas, Crotons, and Nepenthes were especially noticeable, the whole forming a very interesting exhibit.

Messrs. Cuthbertson of Rothesay staged a splendid collection of hardy herbaceous cut flowers, which worthily received a silver-gilt medal at the hands of the judges, the same firm also taking first prize for twelve varieties of herbaceous flowers. Mr. Forbes of Hawick sent six stands of border Carnations, many of the varieties being new, and all of them were very much admired; a silver medal was awarded. Mr. W. Barron showed an interesting and instructive collection of cut shoots from hardy ornamental trees and shrubs, and Mr. J. Crawford of Coddington Hall Gardens sent a fine collection of hardy fruits.

A new class, open to market growers only, brought some capital tables of useful plants, just the sort to encourage for a town like Leicester, as useful for window and room decoration. The cottagers' exhibits made a good show in themselves, especially in vegetables, and it is very gratifying to see such a great interest taken in horticulture by the people of Leicester.

FRUIT AND VEGETABLES AT THE TAUNTON SHOW.

The show of fruit on the 10th inst. was even better in some respects than usual, this being strong commendation. Six persons competed with a collection of eight varieties, the first prize going to Mr. W. Iggulden, gardener to the Earl of Cork, Marston House, Frome, who had very well finished stands of three bunches of Muscat of Alexandria and Madresfield Court Grapes, a good Hero of Lockinge Melon, Bellegarde Peaches, Pineapple Nectarines, Moor Park Apricots, Williams' Bon Chrêtien Pears, and Jefferson Plums, all in excellent condition. Mr. J. Lloyd, gardener to Vincent Stuckey, Esq., Langport, was a very close second, the Black Hamburgh and Muscat of Alexandria Grapes, seedling Melon, and Pineapple Nectarines in this collection being very good. Mr. A. Crossman, gardener to J. Brutton, Esq., Yeovil, was third, his front dishes being remarkably good. Mr. Iggulden was also first with four dishes, having well-coloured Madresfield Court Grape, Golden Gem Melon, Bellegarde Peaches, and Elruge Nectarines. Mr. Lloyd was again second, and Mr. Crossman third, two other good collections being shown.

Mr. Iggulden was well first in the class for Black Hamburgh Grapes, the only fault being smallness of berries. Mr. W. Crossman, gardener to Captain Dick, was second, and Mr. D. Hobby, gardener to Sir J. Ponsonby Fane, third. In the any other black class Mr. H. W. Ward, gardener to the Earl of Radnor, was first with Madresfield Court in good condition; Mr. Iggulden being a close second with the same variety, and Mr. Lloyd third. The best Muscat of Alexandria were shown by Mr. Iggulden, Mr. Lloyd being a good second, and Mr. Ward third. With any other white variety Mr. F. Crossman took the lead with very good Buckland Sweetwater, Mr. Ward following very closely with the same variety the third prize going to Mr. A. Crossman

good Buckland Sweetwater, Mr. Ward following very closely with the same variety, the third prize going to Mr. A. Crossman.

Melons were not numerously shown. The Rev. W. S. Cotter, Yeovil, was first with a very good fruit of Hero of Lockinge, Mr. Iggulden following with Golden Gem at its best, Mr. Ward being third. The best dish of Peaches, apparently Crawford's Exquisite, was shown by Mr. J. Reed, gardener to F. J. L. Parsons, Esq.; Mr. S. Kidley, gardener to W. S. Hall, Esq., being a good second. Very fine indeed were the fruits of Pineapple that gained Mr. A. Crossman the first prize for Nectarines, Mr. J. Webber, gardener to G. F. Luttrell, Esq., being a good second with the same variety. Messrs. Webber and Iggulden were the prizewinners with Apricots, and with Pears Messrs. D. Hobby and S. Tottle were successful. Messrs. Iggulden, W. Greedy, W. Uttermere, T. Every, Smith, F. Crossman, and Webber were also prizewinners in other fruit classes.

Vegetables.—Taunton shows are always noted for the quantity and excellence of the vegetables shown, but on this occasion they were more plentiful than usual, and the quality evidently had not been impaired by the dryness and heat of the summer—cottagers, as well as private gardeners, staging grand produce. The best collection of eight varieties

was shown by Mr. T. Wilkins, gardener to Lady Ivor Guest, Henstride, who had very fine Autumn Giant Cauliflowers, Giant White Celery, Excelsior Onions, Intermediate Carrots, Ponderosa Tomatoes, Satisfaction Potatocs, Ne Plus Ultra Runner Beans, and Autocrat Peas. Mr. H. Copp, gardener to W. E. Erle Drax, Sherborne, was a very close second, and Mr. T. Evry, Bath, third. Mr. Copp was first in the class for a collection of vegetables, the prizes for which were provided by Messrs. Jarman & Co., Chard, Mr. Wilkins being second, and Mr. A. Crossman third. Mr. Copp also took the first of the prizes provided by Messrs. Sutton & Sons, Mr. Mitchell, gardener to G. T. C. Grove, Esq., being a good second, and Mr. A. Crossman third. Mr. Garraway, Bath, took the first of Messrs. Webb & Sons' prizes, Mr. H. F. Manley being second. Classes were also provided for all kinds of vegetables, the competition being remarkably keen throughout.

[The report of the plants and flowers has not reached us. It has

been presumably lost in the post.]

A GOOSEBERRY SHOW.

THE annual Gooseberry Show was held at the Sitwell Arms, Wall Street, Ripley, on Saturday last. The berries were weighed by Mr. Joseph Eyre, of Codnor. Mr. James Taylor acted as Secretary. The Show was a complete success, and some magnificent fruit was exhibited. The following is a list of the prizetakers:—

HARDY FRUIT GARDEN.

Peaches and Nectarines.—The full exposure of the fruits to the light is essential. Leaves unduly shading the fruit draw on one side, so that the latter may receive every benefit possible from the admittance of light, air, and sunshine. Without these colouring of the fruit is imperfect, the proper flavour is not developed, and the whole finish unsatisfactory. Earwigs are liable to attack ripening fruits. Trapping with the hollow stems of bean stalks or narrow crumpled lengths of brown paper are good methods of reducing their numbers, if each morning the traps are examined, and the insects caught in them blown out and destroyed. Protect the fruit from birds by hanging nets in front of the trees. They might be arranged at the base so as to catch any falling fruits, but it is desirable to gather ripe specimens before they detach themselves from the trees, choosing a period when they are perfectly dry.

Late Peaches.—Continue to syringe the foliage of trees with the fruit still green. Rapid evaporation from the foliage tends to exhaust

the nourishment available. Refreshment given regularly with a syringe or garden engine is conducive to cleanliness and a prevention of red spider, also an aid to the steady development of the fruit. Adequate root moisture, too, must not be overlooked, giving stimulating assistance only up to the period of the first signs of fruit showing colour, not after, clear water only being used during ripening if moisture is needed.

Ripening Peach and Nectarine Wood.—Nothing superfluous should be allowed to remain on the trees which will tend to retard the necessary hardening of the future bearing shoots. The earliest trees from which fruit has been gathered must have the bearing shoots cut out at once, training in the succession shoots at suitable distances apart. Remove any that are likely to crowd the rest. Attend diligently to the cleanliness of the trees, red spider being perhaps the most insidious pest that attacks the leaves at this period of the year. Frequent syringings with soapsuds or soap dissolved in water at the rate of 2 ozs. to the gallon will destroy the pests and prevent their reappearance if regularly applied. Gishurst compound and other insecticides may be used instead if preferred. Such faith, however, is placed in the efficacy of the various insecticides to destroy pests which prey upon trees that insects are allowed to attain a strong foothold before means are applied to destroy them. In the case of red spider this is a very dangerous plan, as the mischief they are able to inflict upon the foliage of Peach and other trees is irreparable. It is, therefore, important to make war with red spider upon its first appearance. Serious attacks of this insect cause premature ripening of the wood, the leaves as a result falling considerably earlier than they should instead of being retained to the very latest period to assist in feeding and plumping the buds. Clear water, forcibly applied to reach the under as well as the upper surfaces of the leaves, is a ready means of maintaining the trees in health, attention also being paid to moistening the borders. Dryness at the roots is very frequently the cause of attacks of red spider in the first instance.

Treatment of Gross Growing and Weakly Trees.-Trees that are rather weak in growth and lack vigour may be improved by applying stimulants to the roots judiciously, while those growing too strongly must be gradually checked by withholding water and exposing every shoot fully to sunshine and air. In some cases root-pruning will be necessary shortly, or lifting and replanting, the latter method being the best means of regulating the growth in young trees.

Early Apples and Pears. — Early Apples, such as the Red Astrachan, Joaneting, Devonshire Quarrenden, Irish Peach, and Mr. Gladstone, will as they ripen require gathering. Jargonelle Pears are unusually fine in many districts this year, especially where the fruits have been thinned. The reduction to two or three on a spur has resulted in examples being developed above the average size, but where clusters of more have been left the individual fruits are as a rule under the average size. The fitness of fruit for gathering is known generally by the footstalks parting readily from the spurs, or when sound fruits begin to fall of their own accord. A cool period of the day, when the fruit is dry, is the best time for gathering, exercising special care in the handling of choice and increase well as in solver. special care in the handling of choice specimens, as well as in selecting the precise time for securing fruit in the best condition. Some, if gathered too soon, are watery; others, allowed to hang too long, being mealy, a musky disagreeable flavour being apparent, which is not Remove all fruit bored by maggots, whether ready for gathering or not.

Removing Dead Wood from Fruit Trees.—The present is an opportune time for cutting out dead shoots, twigs, or branches in all forms of fruit trees. Such wood can now be easily distinguished, and in the case of wall trees it often appears very conspicuous, as evidenced by dying branches of Plums, Apricots, and Cherries. Remove them at once back to their point of origin, training in their place the healthy adjoining branches.

Morello Cherries .- Thin out the wood in crowded trees to admit plenty of light and air to the shoots retained. It is not necessary to tie shoots closely in at present, that is securing them their full length to the wall or trellis. The extremities will ripen better by being allowed to hang free, the lower parts being fully secured. Ripe fruit required to hang protect with netting.

FRUIT FORCING.

Peaches and Nectarines.—Earliest Forced Houses.—The leaves are now beginning to fall, and this takes place far more gradually with early forced trees than later in the season. The trees being exposed as advised by the removal of the roof lights, there will not be need to assist their falling, as the wind will do it most effectually. Allow them to remain until they part from the trees readily, clearing them away as they fall. Avoid a dry condition of the border, as this may cause the blossom buds to drop when they should be swelling. Excessive moisture at the roots is frequently the cause of premature growth, which should be guarded against, but it is not desirable to replace the roof lights unless the weather is excessively wet. Early forced trees require little pruning, for they do not make strong growth, and have a larger percentage of single blossom buds than those started in spring under more favourble conditions, hence in pruning it is not so desirable to cut back the bearing wood unless of excessive length, and in that case it must be to a wood bud, to insure growth for attracting sap to the fruits. little pruning will be needed provided disbudding has been properly attended to and no more shoots laid in than are necessary to take the place of the current year's bearing shoots and to renew worn-out growths, as well as to provide for the proper extension of the trees.

Early forced trees are seldom too vigorous after they have been

subjected to the process a few years, but generally become so enfeebled as to need the removal of the weak growths, which, though plentifully furnished with fruit buds, are undesirable from their affording smaller fruit than is furnished by the better fed and more vigorous growths. Such trees should have the old soil carefully removed from amongst the roots, and fresh turfy loam, to which has been added a bushel of wood ashes to a cartload, supplied, firming it well, and giving a good watering. Lift any trees that grow too vigorously, shorten the long and bare roots, and lay the more fibrous ones nearer the surface, making the soil firm. These operations require to be performed as soon as the leaves are mature, and before they fall from the trees, yet not before they give indications of doing so.

Succession Houses .- As the trees are cleared of fruit cut out all the current year's bearing wood, not being extensions, and thin all the growths where too crowded. Syringe as is necessary to keep down red spider, or promptly apply an insecticide. Keeping the borders duly supplied with water or liquid manure will greatly assist weakly trees. Ventilate the houses to the fullest extent unless the wood is not ripening, in which case ventilating freely at night and keeping the house rather close in the daytime ripening will be induced. Any young trees that are too vigorous should have a trench taken out about one-third the height of the tree from the stem and the roots cut, filling the trench again firmly.

Late Houses.—The wood should be laid in thinner than is customary with trees in earlier houses, so as to secure the thorough solidification of the growths; then the buds will become perfect, and matter be stored in the adjacent wood for the support of the blossoms and embryo fruit in the coming season. As gross growths tend to impoverish the weaker by drawing to them an undue amount of sap, and prevent an equal distribution of vigour, they must be stopped, or preferably removed altogether. Keep the trees free from red spider by forcible syringings until the fruit gives indications of ripening. The borders should be well supplied with water or liquid manure, and be mulched about an inch thick with short partially decayed manure.

Making New Borders.—If any planting of trees in new houses, or replacing of old by young trees is contemplated, material for making the border should be procured, so that the work may be executed with despatch, and the borders made so as to have time to settle somewhat before the trees are planted. Strong turfy loam, with enough small stones and grit to allow water to percolate through it, is the best, especially that off calcareous formations. The loam should be strong rather than light. Strong clay soils are not good unless they contain a large per-centage of small stones and grit. Where the soil lacks calcareous matter, a goodly admixture of lime rubbish to heavy and of clayey marl

to light loams will improve them.

New borders must have efficient drainage. If the bottom of the border is unfavourable it should be concreted 6 inches thick, gravel, coarse and fine together, with a third of lime made into a mortar-like mass, put in so as to slope to a drain of 3-inch tiles, having a proper fall When the concrete has hardened 9 to 12 inches of drainage and outlet. should be provided, placing the roughest at the bottom and the finest at the top. Cover the drainage with turves grass side downwards, and if a layer 3 inches thick of old mortar rubbish or chalk broken to the size of road metal is added, the roots will seldom pass through this into the strata beneath. Instead of making the border all at once a 4 feet width is ample for a couple of years, and the openings in the front wall to let the roots out should be bricked up so as to insure the occupation of the inside border before they pass into the outside. Loose bricks or dry walls will do for holding up the soil of the borders. The border need not exceed 30 inches and should not be less than 24 inches deep. The compost should be neither wet nor dry, and be put together firmly. The border ought to be made ready for planting by the end of

In respect of varieties and structures it is best to have few of the first and the latter of moderate size, so that those which ripen about the same time con be grown together. The structures for early forcing should face south, lean-to's or three-quarter span-roofed houses being much the best if well ventilated and efficiently heated. For very early forcing Alexander, Early Louise, and Waterloo Peaches, with Advance and Early Rivers Nectarines are suitable. The Peach first named is somewhat liable to cast its buds, chiefly from over-maturity, as the buds on the spurs or stopped shoots are far less prone to be cast than those on the first made wood. For second early houses Hale's Early Alfred and A Bec Peaches; Nectarines, Darwin, Goldoni, and Lord Napier; for succession, Stirling Castle and Royal George Peaches, the two best forcing varieties with Elruge and Dryden Nectarines, unsurpassed for comprise and guality. These cannot well be forced to ripen before the cropping and quality. These cannot well be forced to ripen before the end of May or early in June, then they carry plenty of colour. For midseason, houses D. Harry, Country of Colour. midseason houses, Dr. Hogg, Grosse Mignonne, Goshawk, Dymond, Noblesse, Bellegarde, and Belle Beauce Peaches; Nectarines, Improved Downton, Stanwick Elruge, Rivers' Orange, and Pineapple. Late houses. Barrington, Exquisite, Princess of Wales, Gladstone, Sea Eagle, Walburton Admirable, and Golden Eagle Peaches. Nectarines, Newton, Milton, Spencer, and Victoria.

For an unheated house or wall case-Waterloo or Early Louise, Hale's Early or A Bec, Early Alfred or Rivers' Early York, Dagmar or Dr. Hogg, Crimson Galande or Magdala, Royal George or Grosse Mignonne, Belle Beauce or Goshawk, Dymond or Noblesse, Bellegarde or Barrington, Gladstone or Princess of Wales, Walburton Admirable or Lady Palmerston, Sea Eagle or Golden Eagle. Nectarines to succeed each other in an unheated house—Early Rivers, Lord Napier, Darwin, Elruge, Byron, Dryden, Violette Hâtive, Pineapple, Spencer, Newton, Milton and Victoria

Trees of Peaches and Nectarines for planting in houses are best after two or three, or even four or more years trained to walls or in cool houses, and they transplant with complete success provided they have been duly lifted, so as to move with abundance of fibrous roots. Failing these an early selection should be made of trees in nurseries, choosing the best furnished, most evenly balanced, clean and healthy, and with medium sized short-jointed wood. If carefully lifted when the wood becomes firm and the leaves are parting from the trees and planted without delay, they will experience little check, and, being bearing trees, some fruit may be taken the first year.

Cucumbers.—Houses that are to be used for supplying fruit at Christmas—the plants having been raised from a sowing made about the 10th of the month—should now be cleared, so that the needful cleaning, repairs, or painting may be done thoroughly before the house is wanted. Pot the plants as they require it, growing them in full light, and support them with sticks. They should be grown without stopping, rubbing off side shoots as they appear to the height of the trellis.

rubbing off side shoots as they appear to the height of the trellis.

The autumn fruiting plants should be encouraged to make strong growth by earthing betimes, not making large additions, but enough each time to cover the protruding roots, taking care to have the soil warm and moist. Afford plenty of water, but avoid excessive supplies and dri'olets. Syringe at 3 to 3.30 P.M., damping in the morning, noon, and before nightfall in bright weather. Maintain a night temperature of 65° to 70°, 70° to 75° by day artificially, and keep it through the day at 80° to 90° from sun heat, closing sufficiently early to rise to 90°, 95°, or 100°. Train the growths 9 to 12 inches apart—that is, the side shoots—and stop them at about 12 to 15 inches growth to give the needful fruiting and furnishing wood. Remove all fruit as well as male blossoms as they appear, so as to get the plants strong, the early part of September being sufficiently early to allow fruits to swell for cutting at the end of the month. By cropping lightly at first a good supply can be had later in November and December.

Plants in bearing will require attention in thinning old growths, removing bad leaves, stopping at a joint beyond the show of fruit, to maintain a succession. Plants in frames will be restored to vigour by a good thinning out of the old shoots and the addition of a little fresh loam, giving a moderate watering, and a sprinkling on bright afternoons, closing at about 3 P.M. With liming and the protection of mats over the lights Cucumbers will be produced for a lengthened period.

APIARIAN NOTES.

ARE BEES WILD ANIMALS?

Decision has been given in the Sheriff Court, Perth, in an action in which David Harris, farmer, Aberbothrie, Alyth, sued Robert Elder, farmer, Burnhead, Alyth, for delivery of a swarm of bees belonging to pursuer, which on June 5th last swarmed from pursuer's hive, and were followed by him to defender's place, where they alighted and were retained by him. The Sheriff held that bees in a wild state were the property of the person who could get possession of them. The defender was not entitled to open his door to give entrance to the pursuer to take possession of the bees. He therefore assoilzied the defender, but allowed no expenses.

The above decision by the Perth Sheriff seems to me to be of an extraordinary nature, and contrary to precedent, use, and wont, the latter in Scotland being constituted law. In previous actions it was always held that if the owner of a swarm of bees did not lose sight of them he could enter any premises and secure them by paying all damages, once lost sight of they belonged to any person

who found them, which I think reasonable and just.

Bees are certainly not wild animals in the proper sense, not more so than poultry, pigeons, &c., or the ferrets of the squire or gamekeeper which, according to the above decision, any person may take them wherever found. People should not find anything and keep it. According to an unrescinded law in Scotland all found property is to be handed over to the Baron Bailie, and to a recent law to the police. Had I been the judge I would have acted a Solomon's part and given the owner of the bees his property. The case is one for bee associations to take up, and either get the law amended or administer it according to justice as it was intended.

AT THE MOORS.

The weather has since the 7th taken a turn for the better, and bees are gathering Heather honey quickly. Hives that were almost at starvation point are gaining weight rapidly, and with a few days more fine promises to be the best honey season since 1859.

QUEENLESS HIVE.

A correspondent, "F. J. W.," writes on this subject, and asks for advice. His hive may not be queenless, and it would therefore

be risky to introduce a valuable queen to it. He should try it first with a piece of brood comb containing eggs and larvæ; if queenless it will raise a queen. Any dealer will supply a queen. I obtain all my imported queens, Punics excepted, from Messrs. George Neighbour & Sons, 127, High Holborn, London. Punics can be had from Mr. J. Hewitt, Cambridge Street, Sheffield. If the bees start queen cells by removing the piece of brood the hive will be in a fit condition to receive an imported queen. Nature's book is the best to study, assisted by the Journal of Horticulture, and 7d. sent to Col. Bennett, 50, Gordon Street, Glasgow, will secure an essay on bees by post.—A LANARKSHIRE BEE-KEEPER.

TRADE CATALOGUES RECEIVED.

Messrs. Ellwanger & Barry, Mount Hope Nurseries, Rochester, U.S.A.—Strawberries, Dutch Bulbs, &c.

Osman & Co., 132 and 134, Commercial Street, London.—Illustrated Catalogue of Horticultural Sundries.
Sutton & Sons, Reading.—Illustrated Bulb Catalogue for 1893.

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Melon.—A correspondent whose letter has been mislaid, has sent a Melon desiring our opinion on the fruit. It is very good in appearance, but we are sorry to say quite inferior in quality, and one taste was more than enough. Our correspondent will have no difficulty in recognizing this reply as applying to his fruit.

Thrips Under Glass and Outdoors (E. H.).—There are many species of thrips, and so much alike as to render it difficult to distinguish them from each other. One of the most hurtful is that infesting plants under glass, and this species is also often found outdoors in hot seasons. It is called Heliothrips hemorrhoidalis, and cannot survive the winter outdoors. The most common thrips outdoors is the small black variety. The insects are found on many plants, especially in dry seasons, also in flowers, which they more or less malform. It is called H. minutissima.

Sabbatia campestris (A. B.).—The plant to which you doubtless refer is Sabbatia campestris. This is one of the showiest of our hardy outdoor annuals, and is a native of the open prairies of Arkansas and Red River, where, although not very plentiful, the effect of its deep rose lilac-coloured flowers is quite dazzling when seen through the long grass. It grows from 6 inches to a foot high, with slightly winged stem, branching habit; leaves ovate, amplexicaule, acutc, nerved; flowers nearly 2 inches in diameter, each of the variable segments being marked with a five-rayed greenish-yellow star, having an irregular white margin. It grows well in ordinary garden soil. S. campestris has often been confounded with the Chironia trinerva of Ceylon, and, although agreeing in artificial character, the colour of the flower and the ovate leaves distinguish it clearly enough for all practical purposes.

Winter's Bark (H. B.).—You wish to "know something about Winter's Bark." This is the produce of a small tree (Drymis Winteri) allied to the Magnolias, and is occasionally seen in botanic gardens or choice collections of plants in this country. The bark is a stimulant aromatic tonic, and may be used for similar purposes as cinnamon and Canella alba, for the latter of which it is sometimes substituted. Its odour is that of pepper and basil, and its flavour of a burning acridity adhering to the throat. It is said to be good in scurvy, vomiting, and paralysis, and it is also used for tanning. It was first brought to England from the Straits of Magellan in 1579 by Captain Winter, who went out with Sir Francis Drake in his voyage round the world. He found it very useful to his ship's crew both as a substitute for other spices and as a cure for scurvy. The leaves with other herbs are said to have been used successfully in fomentations, and half a drachm of the bark boiled with some carminative seeds promoted perspiration and relieved those suffering from scurvy. Other species of Drymis, as granatensis and axillaris, possess the same properties, and the fruit of Tasmannia aromatica is used as pepper by the settlers of Australia.

Improving Light Soil—Pear Leaves Browned (F. M. M.).—
If the clay can be dried and smashed into small particles it could be the better incorporated with the light soil of your garden, and would undoubtedly improve it. We have not found raw lumps of much immediate advantage. Clay sufficiently burned to be easily pulverised is especially valuable for mixing with light soil for fruit trees, and indeed all kinds of crops. The Pear leaves have the appearance of an attack by slug-worms, but they have not cleared away, as usual, the whole of the soft substance of the leaf, so that the veins and the skin of the lower side are all that remain; indeed, the leaf surface is almost entire, but discoloured, and there are only traces of slug-worm attack here and there on the upper surface. This may be due to the unusual hardness of the epidermal tissues. It is remarkable, however, that there is not further indications of such attacks. There is no trace of fungal affection, and we think the discolouration of the leaves is due to the slug-worm, the pest having collapsed in its early stages, but not before it had injured the leaves.

The White Beam Tree (A. F.).—No doubt you refer to the Pyrus Aria of botanists, and which is commonly known as the White Beam Tree, in reference to the white under surface of the leaves. It is a native of Britain, chiefly in the mountainous districts on limestone soils. Its fruit is acid and astringent, but is not disagreeable to eat when in a state of incipient decay, like the Medlar. When dried and reduced to powder it has been converted into a sort of bread during times of scarcity both in France and Sweden; and when fermented it forms a beer, or, by distillation, a powerful spirit. It is greedily eaten by birds, for which reason the trees are ordered to be preserved in French forests, that the number of birds may be increased, in order to keep down the insects. The fruit also furnishes food to squirrels, and when it drops, deer and the hedgehog eat it with avidity. The wood is very hard, of a fine close grain, yellowish white, and susceptible of a high polish. It may be stained of any colour, and is much used in making handles of knives and forks, wooden spoons, and for musical instruments, and various articles of turneryware.

Liliums Unsatisfactory (E. W.).—The buds are destroyed by the same cause as the leaves, but some of the buds have had their stalks gnawed by a weevil, which would probably be found by examining the plants at night with a lantern. The discoloured leaves are due to bacteria generally, but there are traces of another infection, viz., that of a fungus, which is certainly not the cause, but the consequence of the diseased tissues, for it only lives on those which have been disorganised by the bacteria. This parasite is embedded in the cells and sets up a ferment, completely destroying them and leaving its spores attached to the walls of the cells. The fungus comes after the bacterial attack, and is confined mainly to the upper surface of the leaves, as in attacks by eelworm. We were unable to identify the species, which is different to the micro-organism producing wet rot in Potatoes, and the ferment is very much less. The fungus germs are those of Polyactis cana. Try spraying with Bordeaux mixture early another season to prevent the We suspect the plants which had been grown to a height of 18 inches under glass before being planted out in May would receive a check, as their tissues would be necessarily tender, and any injury, though not perceived at the time, would render them liable to parasitic attack.

Tomato Leaves Diseased (W. D.).—The yellow spots in the leaves indicate the abstraction of the contents of the cells by the mycelium of a fungus (Phytophthora infestans), and its "fruits" are just emerging from the under side of the leaves. They are as yet immature on the yellowish parts, while those on the brown portions have been developed and the spores scattered. The best thing to do is to remove all the leaves or leaflets exhibiting yellow spots and burn them, also every part that has become brown or black, then spray the plants with Bordeaux mixture prepared as follows: sulphate of copper 4 ozs., powdered, dissolving in a vessel by itself in 3½ gallons of water, then slake 4 ozs. of quicklime (quite fresh) in another vessel, and form into a thin limewash with water, and pour it through a hair sieve slowly into the vessel containing the copper solution, adding enough water to make 7½ gallons altogether. To make sure that this will not injure the plants drop a few drops of ferrocyanide of potassium into the Eordeaux mixture after it has been well stirred, and if it turns brown it will injure the plants, but if it remain a clear celestial blue it is perfectly safe. It should be used as soon as made, not letting it stand for several hours. Any fruits near ripening should be cut, and then spray the plants in every part, repeating in the course of a week or ten days. The mixture may be kept from the fruit by wrapping it in oilskin before spraying, removing it afterwards. This makes safety doubly sure as regards danger in using the fruit from the adherent copper. Maintain a dry atmosphere with free ventilation.

Names of Fruits.—Notice.—Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing. The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. (Lover of Fruit).—Pears—1, Jargonelle; 2, Not ripe,

probably Louise Bonne of Jersey. (George Pennill).—4, Beurré Clairgeau; 5, Williams' Bon Chrêtien; 6, Windsor. The Apples are deformed or defective, and cannot be identified. (G. C.).—As has been many times stated, Plums cannot be named without portions of young wood with leaves accompany the fruit. (W. G. J.).—The Apple is either a local seedling or a continental variety, and has no recognised name on our list. (H. D.).—The Plum is probably Pond's Seedling, but young shoots with leaves are necessary for satisfactory identification. (W. S. Payne).—16, Allen's Everlasting; 48, Longville's Kernel; 60, Whorle Pippin; 71, Golden Reinette. (A. H. Lawrence).—1, Lord Suffield; 2, Perhaps Gloria Mundi distorted; 3, Possibly a small Domino; 4 and 5, New Hawthornden; 6, Winter Majetin. (J. T. Dare).—You ought to have informed us if the flowers of the Nectarine are large or small. If they are small it is Stanwick Elruge. (H. M.).—The Pear is a good example of Williams' Bon Chrêtien. The Apple cannot be identified.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (Π . E. M.).—The specimen arrived in a very defective state. It is possibly Dimorphanthus mandchuricus, which sometimes produces leaves 4 feet to 5 feet. Very ornamental in shrubberies. (G. F. S.).—Monarda didyma (Bergamot). (G. A.).—The specimens are quite insufficient for identification. The habits of such plants should be clearly described, and better examples packed to arrive in a fresh state for purposes of nomenclature. (C. F.).—Enothera macrocarpa. (G. A).—1, Davallia canariensis; 2, D. decora; 3, Acrophorus affine; 4, Adiantum Weigandi; 5, A. elegans; 6, Cornus sanguineus.

AUTUMN TILLAGE.

Of the many lessons of the great drought, most important of all was that of the primary value of deep and thorough autumn tillage. Without it many a farmer's hands have been tied, a seed bed was an impossibility. Why? Because his heavy land was not ploughed till after it became saturated by the heavy rainfall of an exceptionally wet February. The wet furrows were then exposed to the drought which set in early in March, sun and wind then drying them so quickly that the clods were impervious to any implement - roller, cultivator, or harrow made no impression upon them, and Lent went by with out a field being sown with corn. Even where matters were not quite so bad, the soil being crushed sufficiently to admit of the sowing of both corn and root crops, much of the seed lay dormant week after week, the plants coming in patches. When rain at length fell, growth sprung up from the dormant seed, with the result of many a cornfield in July having patches and strips of ripening corn alternating with others quite green and in full growth.

Where the land had thorough tillage last autumn, and was left for winter well drained, clean, thrown up into ridges, and with perfect mechanical divisions, it broke down under the harrows into an excellent seed bed-sweet, mellow, moist, and light as ashes. In the second, or early in the third, month of the year sowing went on with a rapidity and finish impossible under a less perfect system of cultivation. Seed germination followed quickly and evenly, up came a full strong plant, growth went on without serious check or hindrance from drought, on to such early maturity of the corn, that very much of it was in shock or stook a month before the usual time of harvest. Roots, too, have thriven equally well, and timely intelligent farming stands triumphant. The year for it is crowned with plenty, for be very sure that hand-in-hand with such energetic tillage goes an equally sensible systematic storage of the soil with plant

Drainage, mechanical division, cleanliness, autumn tillage, sustained fertility, carefully selected seed, timely sowing, these are the watchwords of the successful farmer. The guiding principles of his practice, they affect all he does. He is successful not only because of them, but also, and very much also, because they are combined with sound judgment, and powers of discrimination, which enable him to apportion his cropping and modify his practice whenever it becomes necessary or advantageous to do so.

This autumn a golden opportunity has come to him in the early harvest. The clearance of the corn from the land so early in August will enable him to have the stubbles quite clean before plough and subsoiler are at work. His land is so free and open that the broadshare can be used at once to slightly pare the surface, so that perennial weeds may be got together by the harrows which follow and be burnt. Soil that is crude, hard, and heavy cannot be pared so easily; it is usually so hard after harvest that neither plough nor broadshare will enter it till it is softened by heavy autumnal showers, and so precious time is wasted and the opportunity for thorough tillage lost. There should be time this autumn for doing something to correct the crudeness of heavy land. Gas lime has been used with excellent effect upon the Essex clays. When applied in autumn it acts mechanically upon the soil, stimulates latent fertility; but it ought never to be used instead of manure. Rather apply it, or lime fresh from the kiln, early in autumn, and sow chemical in orchards and elsewhere, which stock frequently reject, may be made

manure with the corn, roots, or other crops in spring. As a rule, lime may be used advantageously once in six years at the rate of 60 to 100 bushels per acre. One of our finest crops of Wheat was on land which, when it came into our hands, was in a very foul, inert condi ion. It had a summer fallow, was cross-ploughed deeply several times, was dressed with fresh kiln lime during these ploughings, then well manured just before the Wheat sowings. This was a case of necessity as regards the fallow, because the land was so very foul. Coal ashes, slag from smelting furnaces, and burnt clay are also excellent for opening up the land. In mining districts there are immense heaps of slag-enough for the land of a wide district, but which is seldom if ever turned to account for such a purpose.

WORK ON THE HOME FARM.

Since writing our last note thunder storms, with a heavy downpour of rain, have been frequent, but there has been nothing worthy of the name of wet weather, and harvest work has gone on with despatch. On some farms the whole of the corn is in stack, and the ploughs are at work upon the stubbles. First of all such weeds as Couch Grass, Coltsfoot, Thistles, Docks, and Ononis or Rest Harrow must be destroyed, then ploughing follows at once, cultivators, horse hoes, harrows, and ploughs all being in full swing, so as to have the soil cleaned, broken up deeply, turned over by cross-ploughing two or three times according to the weather, and at the last turn all that is left for the spring sowing is thrown into high ridges by the double-breasted plough.

Have all land intended for autumn sowing with Wheat, Rye, and Winter Oats ready for the corn drill by the end of the month in order that the sowing may be done early in September. The seed will go in quickly and well then, but if the sowing is put off till October it may have to wait for fine weather till spring. Get in the corn then in September, so as to do the work in the best way, and have a full strong plant. Sow no Wheat on inferior land, only on the best mixed soil; select good seed, and apply manure through the drill with the seed half hundredweight sulphate of ammonia, quarter hundredweight steamed bone flour, and quarter hundredweight superphosphate per acre. This very moderate dressing is to get a sturdy plant before winter, and is followed early in spring with $1\frac{1}{4}$ cwt. nitrate of soda, quarter hundred-weight steamed bone flour, half hundredweight superphosphate, and half hundredweight muriate of potash where necessary.

It may appear somewhat premature to mention this matter while harvest is still in full swing, but it is not. The common fault is to relax efforts after harvest, just when all in our power should be done to push on autumn work, and get as forward as possible before wet October comes. Now is the time for strenuous effort. Strive to be well beforehand with all farm work, but especially with field work, which is so dependant upon the weather. Very pleasant is the feeling when the land is locked up by frost and snow that it was so tilled in the autumn.

BOARD OF AGRICULTURE AND ENSILAGE.

In view of the exceptional circumstances resulting from the drought of the spring and summer of this year, the Board of Agriculture consider it desirable to circulate information concerning the use of ensilage processes, and their value in providing winter and spring keep for stock.

The general impression prevailing upon the subject of ensilage is that it is only serviceable in wct seasons when they cannot be properly made. But there are not a few agriculturists who make silage regularly either in silos, or in stacks, or in clamps every year, and speak highly of its value for feeding purposes.

The wet summer of 1888 gave a great temporary stimulus to ensilage, which was encouraged by the discovery that good silage could be made in stacks and clamps by a comparatively cheap and simple process. This year attention will be again very generally directed to ensilage in consequence of the unprecedented scarcity of grass and Clovers for hay, and the failure of the ordinary crops for winter food caused by drought.

MATERIALS SUITABLE FOR SILAGE.

It may in some cases, it is believed, be too late to make hay of Lucerne, second cuts of Clover, Sainfoin, and grass, as well as of Italian Rye Grass, grass and Clover mixtures, and other crops sown when the drought ceased. All of these crops that can be spared from the immediate requirements of the farm stock may be advantageously made into silage. They should be allowed to stand as late as the weather will permit, for although it is acknowledged to be best to cut such crops as grass and Clover for silage when in flower, the object must be to get the greatest possible bulk of material at this crisis.

Every particle of herbage upon farms should be cut for silage. Even weeds, sedge, and rushes should be utilized. Nettles have been successfully employed. The outsides of fields and the sides of hedges and other waste places should be brushed and the brushings ensiled. The leaves of some kinds of trees may also be ensiled. If the material is too coarse for actual silage it will be useful for topping up the silos, stacks, or clamps. Coarse grass in meadows, pastures, and under trees

into eatable silage. Hop bines should be ensiled directly the hops have been picked, while the sap is fresh. Maize and Sorghum saccharatum are valuable ensilage materials.

PREPARATION OF MATERIALS.

Grass, Clovers, Oats, Rye, Lucerne, Vetches, &c., require no preparation. They are simply mown as closely as possible and carted to the silo, stack, or clamp, and put in, or on, and compressed as tightly as possible that the air may not penetrate between the layers. Hop-bines should be carted directly the hops have been picked, and much pressure applied to them. Where silos are available it would be well to cut hop-bines with the bine cutter used to cut them for manure, or they may be put into stacks or clamps whole, or cut into long lengths with this machine. Maize and Sorghum are usually chaffed in fairly large lengths when put into silos. Maize ensiled whole in stacks or clamps turns out well if properly managed, even though the stalks are very large and thick.

Special machines may be obtained for chaffing silage materials, and elevators for stacking them.

METHODS OF ENSILAGE.

Since the publication of the Summary of Replies to Questions on Silos and Ensilage in Great Britain by the Agricultural Department in 1885 (C.-4536), and the Reports of the Ensilage Commission (H. C.-308 of 1885 and H. C.—119 of 1886), there have been very important changes in the methods of ensilage. At that time the only mode of making silage was to put it into silos, or pits,—receptacles with sides of brick, stone, or concrete. These were often too expensive for tenant farmers. Here and there, however, heads of barns, out-houses, and other buildings were converted into silos at a small cost. On large holdings it would be necessary to have these in various parts of the farm as the carting of green forage long distances would be very costly. But since the inexpensive and simple stack and clamp systems have been introduced, regular pit-silos have not materially increased in numbers.

SILOS.

Existing silos will naturally be made full use of in this emergency, and buildings that can be readily and economically converted may be made into temporary silos, as the silo system has certain advantages. There is generally not quite so much waste as in stacks and clamps, and it is easier to keep out air.

To get sweet silage the silo should be filled somewhat slowly to obtain a temperature of from 130° to 160°, which neutralises the acid fermentation. If the temperature falls much below this, sour silage is

produced.

When silos are filled they are pressed down by machinery, or pressure is given by weights of various kinds that may be convenient, such as earth, bricks, stones upon planks and boards. Machinery for pressing has been patented by several manufacturers.

SILAGE STACKS.

In the wet weather of 1888, as it was impossible to make hay, attention was directed to the most inexpensive modes of making silage, and silage stacks of various shapes and sizes were bastily constructed in all parts of the country. Where ordinary care was taken the result was generally satisfactory, and the experience of practical men in later years warrants the recommendation of the adoption of the stack system at the present crisis.

Silage stacks are made in the same way as ordinary haystacks. The materials are carted and stacked either in circular, square, or oblong stacks. It is important to have great and regular pressure, which may be adjusted, or adjusts itself, as the mass shrinks. If this is obtainable, the materials may be put together as quickly as may be convenient. There are several patented methods of pressing, as by chain pressure, hydraulic presses, and lever appliances. Before pressing

the material should be carefully levelled.

Silage stacks may also be made without special machinery. In this case the material cannot be put together so quickly, and every part must be most carefully and firmly trodden, especially that near the ontsides. Poles may be pitched at the corners and sides of the stack, and braced together at the top to guide the stackmakers. A framework of four large planks may be made round the poles and drawn up as the stack progresses by pulleys fastened to each end of the bracing at the top. This will keep the stack in shape, and allow the outsides to be well trodden down. The boards may be used to cover the stack when made, and heavily weighted with bricks, stones, or other weighty substances. The whole must be covered with straw or other covering to keep out the wet.

A well-known pioneer of the ensilage movement has given up silos and makes silage now entirely in round stacks. They are built slowly, and not pressed nor weighted until complete. Rough grasses or weeds are used to top up, and a layer of these is put at the bottom. The snrface is trodden down, and sand or earth is laid on the top to a depth of about 6 inches. A trench is dug round the stack if the surface drainage is not good, the earth from this serving to cover the silage. "No mode of compression has been found so good," this gentleman writes "as earth or sand; it follows the ensilage down much better writes, "as earth or sand; it follows the ensilage down much better than any other mode of weighting. A little attention is necessary for a day or two, to see that it goes down without cracking. In building the stack it should be kept full in the middle, in order that it may finish convex." He also recommends the use of a mixture consisting of a layer of one load of Oats, Peas, Beans, Vetches, and Italian Rye Grass,

alternating with a layer of two cartloads of meadow grass, the whole being cut or chaffed before being ensiled.

Dry earth may be spread either directly on the silage or on intervening sheets of Willesden paper. In this case no other covering will be required.

Materials for silage-stack-making should be used whole as a rulc, and carted at once after cutting. Hop bines and other coarse material may be chaffed advantageously in longish lengths with a hop-bine

SILAGE CLAMPS.

These are simple and inexpensive receptacles of the green crops enumerated above. They are advocated by practical men as most valuable, especially in times of emergency, and some stock-owners who

have silos prefer to adopt clamps.

They may be made on slightly sloping ground by stumping out the required size, the length exceeding the breadth, and carting material for silage within this area. The carts must be drawn on and over the heap precisely as when a manure mixen is made, and tipped where material is required to fill up. They must be drawn as closely to the sides as possible so as to give pressure there. When the middle has risen too high for further carting the sloping ends are cut off and the material thrown on to the clamp, and levelled, and firmly trodden in. The outsides may be pared off, and the material treated in the same way. Then dry earth should be laid evenly upon the clamp, to a depth of 8-10 inches, either with or without an intervening layer of rough herbage, bracken, or leaves.

On dry soils a trench may be dug 3 feet deep, and of length and width according to the quantity of material. This may be packed tightly into the trench by the carts being led over it. A heavy roller drawn over the mass will help to consolidate it. The soil from the trench can be used for covering and weighting the clamp. Practical men say that the material cannot be too juicy and even wet to make good silage by

this process.

Old pits for chalking land, so numerous in chalk soil districts, form capital receptacles for silage. The carts should be led over the mass, which must be finally left in a somewhat conical form, and covered with earth to a depth of from 10 to 12 inches.

Where earth is used as a covering for silage stacks or clamps occasional inspection is necessary, as the earth sinks with the silage, and

cracks are sometimes formed which must be filled up.

THE USE AND VALUE OF SILAGE.

Many stock-owners and cow-keepers make silage regularly and use it as a valuable addition to ordinary food for stock. In one instance an owner of forty-five dairy cows has for some years kept his cows almost entirely upon silage made in stacks, with an allowance of oil cake. There is much other testimony as to its value for feeding milch cows as well as breeding ewes. For fatting beasts it has been proved that well-made silage is at least of equal value with hay, and for lean stock of all kinds it may be used as a complete substitute for either hay or roots. Farm

horses will do well on properly made silage.

It can be given either by itself, either cut or whole, or it can be chaffed with straw or hay. In the exceptional condition of the scarcity of hay and the shortness of the straw of all crops, there will be little of these to spare for cutting into chaff, and silage may be given alone, and must prove of inestimable value for supplying the quantities of bulky food that are absolutely essential for the digestion of ruminants and to

keep them in health.

11th.—Bright sunshine throughout.

12th.—Rain from 3 A.M. to 4 A.M.; overcast morning with drizzle at 10 A.M. sunny afternoon and evening.

A sultry week with frequent, haze and calm air. Temperature about 6° above the

A sultry week with frequent haze and calm air. Temperature about 6° above the average, the minima in shade being higher than in any other week of the year.—G J. SYMONS.

MEMORABLE to the public generally, and by no class more than the gardening community, will be the remarkable heat of August of the present year. An unbroken term of eleven days, in which the shade temperature was upwards of 80°, and on several days over 90°, with a night minimum of seldom less than 70°, is an occurrence so rare as to demand permanent record. Thursday last, the 17th inst., was one of the hottest days known in the vicinity of the metropolis. The returns vary somewhat from different localities, due in part no doubt to the positions occupied by thermometers, and perhaps in greater part to the variations of instruments from the standard of accuracy. The readings at Greenwich we may, however, expect to be correct, and we are informed that at Greenwich the temperature in the sun reached 146.2° on Friday last, and in the shade 95.1° This, it is authoritatively stated, has not been exceeded in August during the last fifty years, although it was equalled on August 11th, 1884, and it has only been exceeded twice at Greenwich during the last half century, the readings being 96.6°, July 22nd, 1868; and 97.1°, July 15th, 1881. As the minimum night temperature was 72°, the mean daily temperature of August 17th has therefore apparently not been exceeded since authentic records have been kept. In the Royal Horticultural Society's Gardens, Chiswick, on Thursday in the "hot week" the shade thermometer registered 95°, and examiners of the trials of Onions and Potatoes were bravely (?) discharging their duties beneath the shade of umbrellas.

Lives have been lost through the excessive heat, and more no doubt would have been but for those splendid institutions—public hospitals—in which many persons who were stricken found refuge and relief. Much loss has been incurred by the destruction of perishable food, including fruit and vegetables. We have seen it announced that it is not at all uncommon for 5 or 6 tons of produce to be destroyed weekly in Covent Garden during hot weather, but that amount was greatly exceeded during the late abnormal heat. Large quantities were spoiled on arrival, and had to be forthwith carted away, and sent down the river in barges for use as manure. Only those consigners who were alive to the importance of not keeping fruit till it was fully ripe before packing could rely on the produce being saleable a few hours after exposure in the market. One of the most common errors of the inexperienced is to wait a day or more too long with their fruit, and then not being sufficiently careful in excluding bruised or blemished specimens. A very few of these will render the bulk comparatively useless, and especially when the fruit is as ripe as it should be, no allowance being made for its changing on the way —a change that may amount to destruction.

The heat and drought have had a most exhausting effect on vegetation. In some parts of Surrey, where little rain has fallen, thunder showers having gone elsewhere during July, we have recently seen large Elm trees as if seared with fire and hedgerows shrivelled, no green leaves to be seen. In many gardens the time of the workers has been almost exclusively devoted to watering in the hope of keeping shrubs alive, and many large Rhododendrons have perished. Lawns and walks are littered with leaves as in October, and where no sweeping has been done the ground is thickly covered, few being left on many trees and

none of them green. Should a warm moist autumn follow, a second growth on trees, shrubs, and fruit bushes is by no means improbable. Where the drought has been the most severe and prolonged the greatest difficulty has been experienced in maintaining the vegetable supply and keeping flower beds and borders presentable. This could not be done in the absence of deep rich soil and mulching, supplemented by such waterings as could be given by exhausted men.

Fruits of all kinds have ripened before their time, and are generally smaller than usual, also drier, but not too dry for the voracious wasps, which have had most of the best on many trees that could not be protected. The effect of the heat has been seen in the ripening of Apricots on open orchard standards. We had small but excellent fruits from such a tree grown at Dulwich a fortnight ago, and it is worthy of record that 33 bushels of ripe Apricots have been gathered from twenty-four trees grown quite in the open in the market grounds of Mr. Smith of Chiswick, and sold to Mr. Beach, the famous jam manufacturer at Brentford, for 11s. a bushel. This is an extraordinary yield of the ripe Apricots from open standard trees early in August, and could not be produced in other than an abnormally hot and dry summer. The variety was the Royal.

Perhaps no better index of the condition of garden crops generally at the present time could be afforded than by the National Co-operative Vegetable, Fruit, and Flower Show that was held at the Crystal Palace last Saturday. It should be said, however, that the magnitude of the display rendered it necessary to arrange and judge the vegetables on the previous day, Friday. Mr. E. O. Greening, the Managing Director of the Association, appeared proud of the display, as well he might be, although there was a falling off in the number of exhibits in the industrial or cottagers' section, for while the decrease in this section was small, the increase in the entries of professional gardeners, notably for fruit, was very much larger. Last year the workers' entries numbered for vegetables 1525, this year they fell to 1202; but in the professional classes they rose from 502 to 627. In fruit the workmen's entries last year were 154, this year 240; the increase in the professional classes being from 111 to 198. Altogether the entries of the workers in vegetables, fruit, plants, and flowers were 2539, and of the professionals 1388. Mr. Greening in his interesting opening address suggested that the weather had been more cruel to cottagers and allotment holders than to gardeners. These latter had deeper, richer soil, and the lesson should not be lost. Thorough culture tells always, but never so effectively as during a dry exhausting season. The Director thought he might claim for the Show the honour of being the largest of the kind in Britain, as he certainly might. It will be safe to say its equal has not been seen in Europe, and we have yet to learn that an exhibition of garden produce of the same character and magnitude has been provided in the land of great things—America—produce largely grown by cottagers and the industrial population. It may be said, as affording a tangible idea of the extent of the display, that a length of 1100 yards of tabling was requisite for staging the exhibits. These were shown in 245 classes, including seven for honey, and one for farm produce.

Vegetables, fruit, and flowers came from widely distant parts of the country, and the show may fairly be regarded as a national one, not in name alone but in fact. Let it be said at once that it was a credit to the nation, and more especially in the vegetable department, as representing the cultural work of the industrial population. Not the name of a prizewinner will be given here, for if we give one we must give scores, and no one would be the better for the list. All personalities shall remain obscure, and their work alone alluded to. There need be then no fear of free criticism touching tender susceptibilities. It has to be said that the vegetables of the industrial classes, cottagers, and artisans, were decidedly better as a whole than were those staged by

gardeners. The winner of the leading prize collection in the professional class may not be expected to acquicsce in this; but there was not one dish of his produce that could not have been easily beaten by a dish of the same kind in the cottagers' classes. His vegetables were too large. A critical on-looker described them as "clumsy." They represented unremitting cultural attention, no doubt, but also represented waste in labour and material. It is not suggested that those in other collections were better, for they were not. We had large and coarse on the one hand, and small and coarse, or inferior, on the other. Surely all the best vegetable judges know that too much weight is attached to mere size, and yet few appear to have the moral courage to place quality first, as it always should be for vegetables that are supposed to be grown for the dining tables of the affluent who desire to have such vegetables of the highest possible quality. Cottagers' vegetables may be permissibly larger, as bulk is a point of moment; but even then it should not be at the expense of good quality.

It was observable in most of the cottagers' classes that the largest Onions, Marrows, Beet, Kidney Beans, Carrots, and indeed nearly all other vegetables, did not obtain the highest prizes. High quality with useful size appeared to be what the judges had in mind in determining the relative merits of the cottagers' produce. This should always be so, or coarseness and waste will be encouraged as is the case now in gardeners' classes. Prizes are regularly awarded to vegetables that no first-class cook would accept for a first-class dinner. No one who knows what a firstclass dinner is can deny that assertion, yet the absurdity of honouring the unwieldy and unacceptable, as judged by the final and conclusive test, is perpetuated. A gardener who has to supply the best that can be grown for a nobleman's table remarked the other day that he thought the time had arrived when a limit should be placed to size, and that no vegetables should exceed certain stipulated dimensions. There is something in the idea, and perhaps in time he or others may put it into shape by suggesting a maximum size for vegetables grown by gardeners for the tables of their employers. It would result in the staging of produce of much higher quality than is now seen at shows, and to which leading prizes are awarded.

But while the workers led the way by the excellence of their produce in the vegetable classes, the gardeners, as may be expected, were far in advance with fruit, though excellent specimens and dishes were staged in both sections. Cooking Apples were especially fine, and sixteen growers competed in one class. Dessert Apples and Pears were also good. The Apples were of fair size and finely coloured. Pears were mainly represented by Williams' Bon Chrêtien, or, as it was frequently named, "William." Amongst the Grapes Alicantes were the best, though good bunches of Muscat of Alexandria were shown. Plums were finely exhibited both in the culinary and dessert classes. Amongst the Peaches Sea Eagle was perhaps the finest, though there were other very good fruits. Melons were not a particularly good feature, nor were small fruits, the Show being too late for them this early season. Brightness and sweetness were imparted by flowers of various kinds and in bewildering numbers, and altogether the Show in its entirety was a wonderful one considering the season.

The exhibits afforded practical and conclusive testimony of the great and growing interest that is taken in gardening by the community. The excellence of the products also denoted skill in cultivation and the exercise of thought and persevering work in bringing them together in such generally good condition. The Show was a credit to all, organizers and exhibitors. Co-operation in production is evidently growing. Whether anything like equal progress can be made by co-operation in distribution remains to be seen. Mr. Greening and his able associates have done much in one direction, and it is conceivable they can do something in the other, tending to the more profitable disposal of crops to the producers

without any prejudice to consumers, but on the contrary to their advantage.

Always on the look out for something new and good, Mr. Greening said "next year he should like to carry out a novel idea of his own, if he could only get the Judges to work with him, and that was to show in the centre of the Palace a model of a town garden, as it often was, with its bricks and pots, old kettles, and dead cats, and the other rubbish strewn within its boundaries, and to place side by side with it a town garden such as it might be by the aid of co operation and the improved resources and knowledge of working men." If the great organiser can find the means and the Crystal Palace Company find a suitable space in the grounds, real gardens could be formed of the nature suggested that would be interesting, instructive, and attractive (without the cats), but an attempt to carry out the idea in the Palace would, it is feared, result in a burlesque, though no doubt something of a sensational nature might be provided—if there is room.

COLOUR IN PEACHES AND NECTARINES.

UNDOUBTEDLY this has been a very good season for the colouring of the above fruits. Some varieties naturally put on a higher colour even during the dullest seasons than do others. Whether for market purposes or for home dessert the colour of the fruit has a good deal to do with its acceptance, and affects its value There is no fruit more tempting to the palate than materially. a highly coloured Peach; but it is to show how to get high colour in them during a comparatively dull summer that these notes are written. Sunshine is not the only factor which is required. Light is most essential. Exposure to light, air, and sunshine is generally advised, and often practised when the fruits have had the final thinning, and about the size of large Walnuts. But I maintain that this full exposure should take place earlier than at the stoning stage. The finishing of the fruit properly should be studied at the time of planting. A good distance—at least 15 inches from the glass—is the proper position in which to train the branches in the front part of the structure, and when trees are planted and trained upon the back walls those in front should be so disposed as not to obstruct the light from them. The trees must be kept healthy from the beginning, not fed so as to make them gross, but brought into good bearing condition as soon as possible—the result of a well-maintained state of the borders and thoroughly ripened wood.

Setting the fruit is a very important point to consider. Those flowers which are on the upper side of the trellis, in the case of trees growing at the front and those which stand well forward on the back wall trees, should be attended to, whether setting be accomplished by means of the syringe, camel's-hair pencil, or shaking the trees. The aim should be to get a good set of fruit well exposed to the light, and then there will be a fair prospect of having colour in the fruit. The crimson is not put on during the last stages of growth only, but is begun much earlier. I like to see the young Peaches well browned by the time they have stoned; this betokens that deep crimson colour which it is so desirable to obtain. If left till later, just as the last swelling begins before the leaves are put on one side, the fruit, through the sudden exposure, is liable to scald, because being grown in semi-darkness the skin is tender, and unable to bear the sun's rays without injury. Having trees in good health, the foliage kept free from red spider, early exposure of the fruits to sun, light, and air, even in the dullest of our summers fairly well coloured Peaches and Nectarines may be obtained.—G. Garner.

ORIGIN OF THE BISMARCK APPLE.

As a misconception appears to exist in England as to the origin of the Apple "Prince Bismarck," I beg to give you the following details concerning this splendid fruit, as I was present at the monthly meeting of the Horticultural Society of Victoria, held in the Athenaum, Collins Street, Melbourne, where it was exhibited for the first time by a Mr. Clarkson, nurseryman, Carisbrook, and named by the Seedling Fruit Committee in June, 1873:—

At our gardens we kept a register of seedling fruits of merit raised in the Colony that came under the notice of the Committee, when we were under the control of the Horticultural Society of Victoria, and the practice is continued now that the gardens are under the control of the Government, and managed by a Board of Horticulture. Some of the gentlemen composing this Board were

members of the Seedling Fruit Committee of the Horticultural Society when this Apple was named. I enclose a copy of a form that is forwarded to raisers of seedling fruits, which they are requested to fill in and return, when it is again entered into a permanent book, and open to anyone interested in the raising of seedlings. The form will show all the details in connection with this Apple.

I have taken this plan to prevent any further claims being made by any of the other colonies, as I observe in the "Fruit Manual" edition 1884, page 181, it is stated that it was raised in the province of Canterbury, New Zealand, and was sent home to Mr. McIndoe, gardener to Sir Joseph Pease, Bart., Hutton Hall,

Guisborough, and again in the Gardener's Chronicle, February 18th, 1893, where a notice, also a figure of the Apple, appears as grown by Messrs. Bunyard & Co., of Maidstone, who say it is of Tasmanian origin; whilst Messrs. Rivers & Son attribute it to New Zealand. As both statements are incorrect, which can be testified by the Register, I would feel extremely grateful if you can set the matter at rest when an opportunity occurs to give the correct history of this Apple. I also enclose herewith a photograph of Apple "Prince Bismarck," taken by one of the students at the gardens from a fair sized specimen.—Geo. Nellson, Curator, Royal Henticultural Cardon, Richmond Bank, Rumber Melbergue, Victoria Horticultural Gardens, Richmond Park, Burnley, Melbourne, Victoria, Australia, July 10th, 1893.

[COPY AS TAKEN FROM THE REGISTER KEPT AT THE GARDENS.]

ROYAL HORTICULTURAL SOCIETY OF VICTORIA.-REGISTER OF SEEDLING FRUITS RAISED IN VICTORIA.

Apple, exhibited by B. Clarkson, Carisbrook, Victoria, June Meeting, 1873.

	Particulars,	REMARKS.
Kind of Fruit, for example, Apple, Pear, &c. Name of Raiser Locality where raised Date of Sowing If artificially crossed (or chance seedling) Parentage (if known) Date of fruiting, first time Season of Ripening Size (small, medium, or large) Shape (description must depend upon kind of fruit) Skin (whether rough or smooth, ribbed, &c.) Colour of Skin Core (characteristics of—large or small, &c.) Flesh (colour, consistency, &c., &c.) Quality (first, second, or third class) Use (dessert, cooking, cider, drying, &c.) Stalk (short, long, stout, or slender, bent or straight, how inserted) Stalk Basin (large or small, deep or shallow) Eye Basin (large or small, plain or plaited, broad or narrow) Segments (long or short, closed or open, reflexed, pointed, &c., &c.) Pips (large or small)	Apple. Carisbrook, Victoria. Uncertain. Chance seedling. Not known. 1864. Late autumn. Large. Oblate, ribbed towards the crown. Smooth. Yellow striped with crimson, often in some localities covered all Small. [over with deep crimson. White, juicy. First. Cooking. About 1 inch, slender. Deep, wide, lined with russet. Deep, angular basin. Closed, flat. Medium.	The name given to this Apple by the Seed- ling Fruit Committee of the Horticultural Society of Victoria in June, 1873, was Prince Bismarck. A chance seedling found growing on Harrison's Hill dig- gings, amongst the mullock heaps; it was one of a dozen found growing, and was transplanted into my garden by Messis. Walters and Shulty. my prede-
Stone (large or small) Kernel (bitter or sweet) Suture (term applies to Plums, Peaches, &c.) Flowers (particulars as to size, colour, &c.) Habit of Tree (whether spreading or upright, &c.) Constitution of Tree (robust or otherwise) Foliage (large or small, and of what colour, &c.) Date when and where first fruited By whom named (if at all) To what disease liable (if any)	Spreading. Robust. Large light green. 1864, Park Farm, Carisbrook. Named by the Seedling Fruit Committee of the Horticultural Woolly aphis. [Society of Victoria, 1873.	cessors. I was on the place at the time in 1862. Mr. B. Clarkson, of Smoky Gully, got grafts from me. (Signed) FREDK. FRICKE. Witness to Signature, HENRY BEILBY.

The above is a true and correct copy of what appears in the permanent register of seedling fruits kept at the Royal Horticultural Gardens.

SULPHATE OF COPPER AND PARIS GREEN MIXTURES AS FUNGICIDES AND INSECTICIDES.

(Concluded from page 143.)

Now, assuming that we can procure pure sulphate of copper, and prepare with it a one-sixth strength of Bordeaux mixture or bouillie Bordelaise, there is an end henceforth to all cavils over the copper treatment, for the quantity required is so small as not likely to poison the soil, nor in any way prove detrimental to the welfare of animals or mankind. Remember the solution of copper sulphate must be a pure celestial blue, the lime lily white and good. When mixed—the sulphate of copper solution and the limewash—the mixture should abide beautifully blue after a few drops of ferrocyanide of potassium solution are added. The Bordeaux mixture, prepared according to the formula given on page 173 of the Journal of Horticulture, March 2nd, has proved perfectly safe to apply to Vines and a preventive of black rot caused by the fungus Læstadia Bidwelli (Ell.). It may, therefore, be concluded that it is equally safe to apply to all fruit trees or plants subject to fungoid diseases, and as likely to prove as efficacious as a preventive and curative of blight, mould, and rusts peculiar to other plants as to those of Vines. For convenience the formula for the minim Bordeaux mixture may be repeated:—1, for small growers, or indoor operations; 2, for large growers, or for using over vegetable crops in the garden, allotment, or field.

1.—MINIM BORDEAUX MIXTURE.

Sulphate of copper ... 4 ounces Lime (freshly burned) unslaked ... 4 ounces Water $7\frac{1}{2}$ gallons ... ••• • • • ...

2.—MINIM BORDEAUX MIXTURE.

... 1 lb. Sulphate of copper Lime (freshly burned) unslaked ... 60 gallons • • • ...

Dissolve the copper sulphate in one vessel—crystals may be placed in a bag, but powdered soonest dissolves-and slake the lime in another, forming into a thin whitewash; when cool pour into the copper solution slowly through a hair sieve; stir well, test, and if all right the mixture is ready for use. Note.—The mixture must be used without delay; it will not do to prepare it overnight, or keep it a day or two. This applies to all Bordeaux mixtures, for the neutralising effect of the lime only lasts a few hours, after which the mixture will blacken the foliage of plants, being as disastrous as simple sulphate of copper solution, that not being safe to use over tender foliage and fruit at a greater strength than 1 lb. of sulphate of copper to 800 gallons of water.

The Bordeaux mixtures above given should always be used when the foliage is dry, preferably in the afternoon, but always so early as to become dry before the dew descends, and invariably by means of a spraying machine. A handy sprayer, on similar principles to the Malbec bellows, is a desiderata for amateurs. Every garden ought to have a M. Vermorel Knapsack pump "Eclair." Allotment holders may club together and purchase one in fact there another to be one or more in every village let out at -in fact, there ought to be one or more in every village let out at a reasonable charge. Any intelligent labourer can use it.

The uses to which the Bordeaux mixture may be put are prevention and cure of all fungal infestations on crops. examples must suffice.

1, Onion crops.—There is money in this crop, only keep it from the Onion mildew (Peronospora Schleideniana). The plants for seed should be sprayed about the third week in May, and again early in June. Plants for bulbing must be sprayed just as the bulbs begin to form, and repeat three weeks afterwards.

2, Cereal crops.—Corn mildew (Puccinia graminis), about which we know very little more than Felice Fontana published in the year 1767, and certainly no more than resulted from the movement set on foot by Sir Joseph Banks in 1804, the harvest that year being alarmingly blighted, and given in pamphlet, with capital illustrations, by M. F. Bauer. Without setting the Berberry theory aside, we may just look the simple fact in the face that "rust" always appears conspicuously on the blades of cereals towards the end of May or early in June, and in localities where there are no Berberry bushes for miles around. Spray the cereal crops, especially Wheat, the end of April or early in May in the south, later in the north, and repeat in a fortnight or three weeks. Remember that the "rust" attacks the "grass," and that is fosterer of the grain.

3, Potato Crops.—Spray these, each row on both sides, up one side and down the other, the first week in July, again the third week in July, and a third time the second week in August. Early varieties left for seed will only require one, second early two, and

late crops three dressings.

Arsenate of copper, called Scheele's green, after its discoverer, a celebrated chemist, "his own instructor" at Upsal in 1773, attained some repute as an insecticide on the Continent long before Paris green, alias emerald green. Schweinforth green was employed in America, but did not become popular on account of its poisonous nature. It was first used as a destroyer of black fly on Beans, the Bean aphis (Aphis rumicis) being "hard" to kill, and became famous in America through being found effectual in saving the crop of Potatoes from the Potato or Colorado Beetle (Doryphora decemlineata). Then it came into use as a remedy against the canker worm, Codlin moth, and other insects destructive to fruit trees in America, and during the past five years in this country against larvæ eating the foliage and blossom of fruit trees. about Paris green as a remedy for caterpillar infections will be found in the last ten volumes of the Journal of Horticulture. There is one thing about Paris green that I cannot understand namely, a coat of it on foliage or growths will not kill sucking insects-aphides, chermes, and red spider; why house flies have to imbibe very little of the stuff (arsenic) smeared on "fly papers" before death ensues. Of course aphides and chermes are fixed, or provided with a skin that throws off the mixture intended for their destruction; the fact being that the Paris green mixture never is interposed between their suckers and the epidermis-or is their immunity due to their never being reached by the spray? Spray upwards for to reach aphides on the under sides of the leaves, and what happens then? The Paris green mixture kills red spider, the Ivy and Gooseberry acari (Bryobia speciosa), gall mites also, only get it on the buds before they enter them, or on the leaves in advance of their becoming snug in the galls.

It is not, however, about mixtures that contain a little of everything in the hope of killing something, but of Paris green as a combined fungicide and insecticide that I desire to draw

attention.

Orchardists in America and in this country have found that where Paris green has been used for the prevention and destruction of insects that the scab fungus (Cladosporium dentriticum) has not plagued Apples and Pears. In Paris green we have copper, 32:11 per cent., for funguses, and arsenic, 28:56 per cent., with carbon, 6:09 per cent., for insects or their larvæ. Here we have all that is required to kill every parasite preying on crops above ground. That is the thing—spray our cereal crops with Paris green, 1 lb. of the paste to 200 gallons of water, adding enough lime to make it correspond to skim milk, at the latest time it may be used in May with the Strawsonizer. Turnips can be done the same way, and the "fly" will not eat more than one meal afterwards. Later applications can be made with the knapsack pump Eclair, which will serve for all garden and allotment requirements. The lime must be fresh slaked, and when cool added to the Paris green mixture slowly through a hair sieve, stirring the mixture whilst the limewash is being added. The object of the lime is twofold. 1, To admit of the better application of the mixture; 2, cause the mixture to adhere better and longer to the plants. Instead of the lime 4 lbs. of flour may be added to the mixture to retain the poison on the foliage, but it is not equal to the lime, which serves other useful purposes, the chief being absolute safety to the foliage from the copper of the arsenite—Paris green—and it suffices if the Paris green mixture has enough lime stirred in to render it slightly Care must be taken not to use it over vegetable crops that will be required for table before the parts dressed have been allowed time to be washed clean by rains, and the "paste" only should be employed for the mixture, dry Paris green being not only difficult to mix but dangerous to handle.

Experiments in the treatment of Apple scab were carried on by Prof. E. S. Goff with Paris green mixture in 1891, and though several other fungicides and insecticides were tried it proved "more efficient

in preventing scab and more effective against insects than any of the other preparations used singly or combined." This is good news -too good almost—only it is confirmed by all who have used Paris green mixture in two or three consecutive years. Spraying, therefore, is a paying concern, for it is better to prevent than to provide a cure for fungal and insect plagues. Fruit trees are beset by other fungoid growths besides scab on Apples and cracking in Pears. Mildew often attacks Apple blossom and its young leaves, the fungus (Oïdium farinosa) preventing the young fruit swelling and crippling the growths. When a crop of fruit appears certain caterpillars emerge—not borne on the wings of east winds—from The Codlin moth deposits its eggs at or near the eye of Apples and Pears before they turn down, and many other depredators commence their attacks as soon as the buds, foliage, blossoms, and fruit are sufficiently advanced for their food. The duty of every cultivator is to place a barrier between the spoilers and the object aimed at. Paris green paste, 1 lb. to 320 gallons of water, is generally strong enough to use over Apple trees just after the petals fall, as the foliage is then tenderer than that of Pear trees. Cob Nuts and Filberts, 1 lb. of Paris green to 265 gallons of water, sufficing for the latter while the foliage is young. Plum and Damson trees, Currant and Gooseberry bushes bear the mixture full strength, Paris green 1 lb. to 200 gallons of water, with sufficient fresh made limewash added to give it a slightly milky appearance, from the first, and all the foliage after it is fully developed. At the strength last named it should be sprayed on trees liable to fungoid or insectal parasites by the time the buds commence swelling in spring, say at the end of March, earlier or later by a week according to the season, and it ought not to be used after the flowers expand, on account of the bees, as well as being dangerous to the fructi-fying organs. This is a precautionary measure, but not the least important of the series. The second spraying should take place directly the fruit is set and commences to swell, say the first or second week in June for Apples, but be guided by the condition of the trees and the infestation, for in case of a severe and early attack of caterpillars it may be desirable to spray the trees just before the flowers open, otherwise the pests devour, the flowerseverything, and repeat the spraying directly the petals have fallen. This will only be required in exceptional years of caterpillar infections. Usually four sprayings are sufficient—that is, the two before mentioned—1, at the end of March; 2, early in June, and a third a fortnight after the second, with a final one the second week in July. The latter spray may interfere with the early Apples and Pears, therefore cultivators must exercise their judgment and discretion, for it must be understood that no fruit treated with an arsenical or copper preparation is safe to eat until it has been washed by rain.

Raspberries are the most susceptible of damage from copper or arsenite mixtures. Paris green mixture must not be used on them at a greater strength than advised for the tender foliage of the Apple tree. They have many enemies, which may be accounted for from the fact that the latter are allowed to have their "own sweet will" on Raspberry plants. The "minim" Bordeaux mixture may be employed safely against fungal pests, which are not particularly troublesome in this country; but foliage biting and eating creatures are best destroyed by Paris green mixture not stronger than for Apples, and not applying it later than the full-sized flower buds appear.

Strawberry plants are sometimes plagued by blight caused by a fungus (Oïdium Balsami, a stage only in the development of some Erysiphe). The plants subject to the attacks of the parasite may be sprayed with the "minim" Bordeaux mixture just before or when the flowers show colour, and repeat directly the fruits are set; but it is rare that more than one treatment is necessary. If Paris green mixture is used it must not be stronger than advised for Apples trees, and not be applied later than the first "peep" of white blossom in the trusses.—G. Abbey.

THE VALUE OF TREES.

Though it looks as if Brother Jonathan threatened to take possession ultimately of these happy islands with his corn, his beef, his millionaires, his redeemed Irish patriots, and his "notions" generally, it is scarcely likely that we shall ever introduce the American festival "Arbor Day" into the British calendar. The four national holidays in the United States are, "The Glorious Fourth of July," "Washington's Birthday," "Decoration Day," and "Arbor Day." "Decoration Day" is that consecrated to the embellishing of the graves of those who fell on both sides during the Civil War of 1861-65; "Arbor Day" is that on which old and young go out in parties and plant whole districts of barren public land with infant timber. In our own colonies similar conditions have suggested the adoption of so reasonable a custom, and

"Arbor Day," or possibly "Arbour Day," may yet become a

recognised festival with old and young in Australia.

This wholesale method of regenerating waste lands is eminently characteristic of a practical and pushing age, and the consideration of it naturally leads to the consideration of the work which has been effected more slowly by prescient individuals among the fore-fathers of the English-speaking people. Although Old England was in parts bountifully clothed by Nature with forest, there are many districts now presenting a charming panorama of wood, of field, and of lawn, which four hundred years ago more resembled those wastes our emigrant kinsmen are seeking to reclaim abroad. From the descriptions given by foreign travellers of England during the sixteenth century it would seem as if much of it was spongy, waste, and open where now the landscape delights the eye of the visitor in whom familiarity has not bred indifference. This transformation slowly effected here is being reproduced as though by magic in other parts of the globe, where a warmer sun often working upon an irrigated soil develops vegetation with almost twice the rapidity it does in England. We have heard of the wonders worked by the Mormons at Salt Lake, and these have been more than repeated by the settlers at Fresno and Los Angeles in California, and at Christchurch in New Zealand.

Our Queen had already reigned fourteen years when the Canterbury Pilgrims pitched their tents upon the verge of the great open moorlands extending for hundreds of miles at the foot of the New Zealand Alps. It was an immense prairie land, as large as Piedmont, covered with nothing but coarse tussock grass, and lying between the ocean and a wall of snow-capped mountains. In summer it was often scourged by a sirocco bearing a simoom from end to end without encountering a tree to check its sterilising influence. Now, for a radius of thirty miles around the Cathedral of Christchurch, the landscape is as fresh and green as that of Essex, beset with Willows, Poplars, Acacias, and Eucalypti, and enclosing dairy farms as fine as those of Holland. Anyone who had gone to sleep in England and awoke in a drag on the way to the "New Zealand Cup" at Lincoln outside Christchurch, in November, would merely imagine he had been transported to another part of England. Year by year the mantle of vegetation heightens, until the day will come when to the inhabitants near the sea the view of the distant mountain ranges will become invisible except by ascending

the Cathedral spire.

Such is the magical effect which the hand of man can produce by erecting a shelter of timber against the influences of unrestricted nature. But the beneficial influences of planting are not confined to fostering moisture upon dry prairie lands or even to stopping the pernicious drifting of sand-dunes as has been done so successfully on the "Landes" of Western France. The ameliorative effect of trees upon soil is far from being fully realized. The effect of certain trees, such as the Eucalyptus, is medicinal and curative on certain miasmatous land, as we see in the reclamation which is being made of the Italian Campagna; and even in our sour boggy soils the most curiously opposite effects can be produced. Planting acts in a variety of ways. It makes a dry and shifting soil stable and moist by intercepting sun heat and breaking the wind. It makes a sodden soil warmer and sweeter by absorbing much of the moisture and preventing the refrigerating effect caused by the impact of cold and drying winds. Indeed if the right kind of tree can be discovered there seems to be scarcely any complaint of the soil which planting cannot do something to cure, and we cannot but admire the good sense and public spirit of the United States where the question of afforestation is made a matter of national conscience

and national co-operation. It is not generally known that in wet climates barrenness of the land is often due to baneful fungoid growths, which tend to keep it in a condition of bog. It has been noticed in the more northerly parts of Great Britain that often where a shelter of trees has been opposed to the winds striking upon a sodden sterile soil, the outer portion on which the full brunt of the attacks falls becomes covered with a mossy or lichenous growth, which curiously enough is absent on the interior trees where one would more naturally expect it. This would seem to indicate that such plantations operate as a kind of sieve or strainer of the spawn borne by the winds, and this theory is borne out by the fact that as the trees grow up the land behind the trees loses its mossy or boggy nature, and becomes capable of bearing crops and grasses. Land robbed of its shelter and left exposed to the winds, even when laid down in pasture, has been known to deteriorate rapidly, while that which was sheltered while lying fallow recovered much of its productive power. This shows that in cold and wet climates the action of trees can be as beneficial as it is in lands where it is hot and dry. Indeed, it is marvellous to reflect upon the possibilities which still lie before the human race in this matter, and of the transformation which will surely pass over the face of much of the earth, hitherto regarded as melancholy and useless.-M. H.

MR. M. DAVIS.

HAVING in view the doubts that have been expressed relative to the planters of some of the "Goliaths of Grapedom," and the various claims advanced for tracing the origin of the Vines to the ancestors of present day writers, we have decided that posterity shall know who the raiser of at least one famous Vine was, also to show what manner of man he is some thirty years after he inserted the cutting.

Mr. M. Davis is undeniably the raiser of the magnificent Vine at Manresa House, Roehampton, and has pruned and trained it throughout its career. So far as we know there is no man living who can look on a similar achievement. The mere size of the Vine is something to be proud of, but add to this its fine character and splendid condition, then public recognition of Mr. Davis' work becomes almost a duty. We have certainly great pleasure in giving honour to whom honour is justly due in this case. Thirty years of unremitting attention and cultural skill have made the Vine what it is to-day—a veritable

FIG. 25.—MR. M. DAVIS.

giant in the vigour of youth that produces Grapes of first-class quality, and would produce far more if pressure was resorted to. When in full bearing there is no finer sight in Grape culture to be seen near London, and nothing more creditable to any gardener.

We do not appear to have any honours for disposal in this country for a lifetime of work so well done in the form in which it is represented in this Vine, but honours galore have been distributed for products that bear no comparison with this cultural work of Mr. Davis. So far as we know the Manresa Vine stands alone as the finest in the world raised and tended by one man from the beginning until now. Mr. Davis is a successful grower of all kinds of fruit, and as intelligent and courteous as he is able. Though a very real worker, he is one of Nature's gentlemen, and we have not heard of one visitor out of many return from Manresa gardens and express anything but high approval of the man and his work. Mr. Davis is an excellent type of a British gardener.

NOTES BY THE WAY.

A WEEK or two ago I expatiated mildly over the attractions of East Grinstead, a pleasant little town on the Surrey side of Sussex, and said a few words about one of its gardens. If I were to content myself with that a second visit could not be paid without apprehension, for there is that wholesome rivalry amongst the various gardeners in the district which does so much to keep up a high standard of work. "And why?" each might say; "haven't I a right to be talked about as well as So-and-so?" Dear sirs all, you have the same claim, and shall have the same attention, but one at a time, please; let us go to work methodically. I chatted on the first occasion about pleasant Oakleigh with its fruit

cage, and now I cross the road to make a jotting or two about Brockhurst, the charming place of Mr. Murchison, where gardener Simmons gives a welcome and a good account of himself to gardening visitors.

It would be far from easy to find a place with gardens more undulating than these. I have a lively recollection of climbing some steepish banks at Abberley side by side with Mr. Arthur Young some few years ago, and I thought then that a course of athletic training would not be amiss for helping one to get about in comfort. It is very much the same—if anything, a little more so—at Brockhurst. It is really all climbing, not quite of the lope and alpenstock sort, but still fairly steep, and what it lacks in this respect it makes up for in quantity. There are banks and slopes whichever way you turn. All this, though it may be somewhat tiring to those who have not been dieted and sweated and bustled about as though they were going in for a university boat race, gives very unusual features and presents aspects of considerable charm. There is a sameness about level ground as there is about smooth water, and one appreciates an uneven surface as he does the foam-tipped swell on broad ocean expanses—always providing there is no sea-sickness about.

The house is a long, somewhat low informal structure. I do not know what style it is in, for the difference between the Gothic and Renaissance is about the extent, I grieve to say, of my architectural knowledge. But I do know that it is handsome, cool and inviting. There is nearly as much difference between houses as there is between gardens, some being massive, formal and cold, with a frowning and gloomy aspect, such as are fitted by a setting of clipped Yews and the like; others rambling, natural, and comfortable looking, with which an undulating garden surface, luxuriant shrubs and bright mixed borders at once associate themselves in the mind. Mr. Murchison's house is one of the latter type, and a more charming country residence is not easily imagined. It is a home, not a mansion. The conservatory attached is lofty, spacious and cool, being heavily draped with green creeper growths, and softened with the filmy humidity of Ferns, but not devoid of brightness, either, for well grown flowering plants are sufficiently represented to prevent any suspicion of sombreness. I have never entered a more attractive conservatory, and Mr. Simmons may be pardoned if he feels somewhat proud of it, but he is one of those modest men who hide their feelings from the vulgar gaze, and so I cannot say what his sentiments thereon may be.

The residence faces north and south. I am a little dubious as to which would be styled the front, but accord that honour to the broad sweep of windows and entrances looking upon the southern hills. A beautiful view may be had from them, one of the most delightful without a doubt in the county. There is absolutely nothing to obstruct it. The garden sinks away below the walls in many a grassy terrace and steep declivity, and beyond it stretch the fields and woods, which melt away at the base of the wolds. It must present a charming spectacle of soft tender pastoral beauty in the glow of early morning, not less pleasing than the mellow aspect of meadow and forest when the heat of the day is upon the country side. I did not see it under either condition, but under the tearful mantle of a heavy and protracted rainstorm; but it is there, and no exaggeration of imagination is needed to invest it with features of beauty, reposefulness, and charm.

Mr. Simmons will, I feel sure, forgive me for not going into details of his excellent flower gardening under the circumstances. I must sorrowfully admit that it is not within my scope to recall from memory every bed in every place I enter-would that it were. And as to notes, why they would have presented much the aspect of the tear-punctured missives which writers of love stories have familiarised us with, even to the extent of being undecipherable, had I attempted to take them in the pelting storm. It was worthy work of its kind, particularly the subtropical beds, which linger with me as exceptionally well arranged and admirably furnished examples. Nor were the conditions favourable for noting down the names and altitudes of the many good Conifers with which the grounds were studded, or for a description of the shrubs overhanging the lake. Personal wishes are as nothing when the rain falls with that tropical luxuriance and steadfastness which make umbrellas more sighed for than lead pencils, and mackintoshes more desirable than notebooks. I am not prepared to say that the drops were as large as eggs, which is the sort of thing Clark Russell tells us about in those wonderful sea stories of his, but the rain fell long and with a waspish persistency. I must sum up the gardens and grounds by saying that they have been most judiciously laid out and planted, and are a not unworthy reward for the thought and care which both master and man have bestowed upon them.

There is not a great amount of glass at Brockhurst. One would expect rather more from a place of its size. This, however, only affects a writer in that it leaves him less to say than he would otherwise have at his command. What space there is is made the most of. The Peaches and Nectarines were eloquent with the language of health, foliage, and abundant fruit. The main plant house was as full of fine, strong, clean, and healthy material as it could be comfortably packed with; indeed, the thought strikes me that there must have been as much ingenuity exercised to get the plants in as skill to grow them so well. To be sure it is a hard thing to throw healthy plants away. A gardener no more likes to do it than parents do to cast their children out upon the world.

Amongst various good things in one of the houses I noticed a batch of a Carnation much thought of locally, named Pope's Seedling. It is a very floriferous tree with lemon, rose-flaked flowers, but I am told often throws selfs. It appears to be a very useful variety worth seeing in other parts.

Brockhurst boasts a well-stocked kitchen garden and a noble array of fruit trees, but as the concentrated iniquities of a score of shower baths had done their worst upon us by the time we got amongst them, we were fain to hurry through. The place is in good order all over, and if the gardener is as satisfied with his handiwork as he might justly be, he is far from being a discontented man. All the soft water there was about moved neighbour Dunn, who was one of the saturated ones present, to dilate on his favourite theory of the value of rain water and the absolute worthlessness of hard. The young Oakleigh gardener is as smart and promising a man as I know, but he really has most eccentric ideas in respect to water. According to him a nice strong solution of arsenic would be about as nourishing to a plant as hard water. A medical gentleman with a strong antipathy to alcohol recently propounded the statement that there is about the same amount of support in the bite of a mad dog as there is in a glass of stout. Mr. Dunn gives hard water about an equal value for plants. Of course he does not forget to let loose a deluge of arguments on the head of anyone who questions his theory. What does he say to putting some of them in print?

It would be bad for town gardeners if hard water were as injurious to plants as some of our friends assert. What, I wonder, would the many earnest and persevering amateurs do whose plants never receive any except hard water, and in a season like the present, too? Gardening for them would be a more troubled pastime than it is now, and it is already full enough of difficulties and drawbacks.—W. P. W.

SCARLET RUNNER BEANS NOT SETTING.

I HAVE read with much interest what has recently appeared in the *Journal* on this subject, and I desire to take this opportunity of thanking all those correspondents who have kindly replied to my inquiry (page 80). There is, however, so much differing among the doctors that I am yet at a loss how to decide; still, I am thankful for the information contained in their communications.

In my letter I naturally connected the scarcity of humble bees with the scarcity of Beans, having read at some time that their presence was necessary in order to secure a crop of red Clover seed, but now that I have observed more closely the way they work at Bean flowers, I do not think they are instrumental in the "pollination." The proboscis is directed to the very base of the corolla, and not towards the reproductive organs. On the other hand, I cannot agree with those who consider these insects injurious to the organs or the embryo Beans, for I have known seasons that it was next to an impossibility to find a flower whose calyx was not pierced by them, yet Beans were abundant.

One writer thinks that the earlier blooms failed to set owing to the excessive heat and atmospheric dryness. Granted, but why was there not a change for the better, say in a week after the rain came, and the consequent lowering of temperature? Whereas my Beans did not begin to set until the 31st of July. This improvement continued for about ten days, when the flowers began falling again to some extent. During that period we have had a good downpour, and to all appearance the weather was perfect. A neighbour living a mile distant called my attention to this circumstance, when we at once proceeded to examine my own Beans, and found it even so.

I agree with Mr. Abbey that drought and poverty will cause the flowers to drop wholesale. Probably I have not grown so many crops of Beans as he has, but I have grown about thirty, and I have never before failed to get a fair amount of pods by copious waterings. Indeed, I had come to regard the Bean crop as a certainty if plenty of water could be given.

Among other causes advanced are over-luxuriance, growing in enclosed spaces, thrips and other insects infesting the plants. With regard to the two former reasons, it appears from the writers on page 106, and from my own inquiries and observations in this neighbourhood, that no matter what the treatment, position, or state of the fertility of the soil, the results are pretty much alike. I certainly found a few yellow thrips in some of the flowers I examined, but not enough, I think, to do any serious damage, and even if it were so I cannot account for their sudden disappearance about the end of the month, which we must suppose took place, thus allowing the organs to fulfil their functions.—T. S., Bristol.

THREE DAYS' HOLIDAY IN THE ISLE OF WIGHT.

ARRIVING at Ryde I went by train to Shanklin, distance ten miles, and near the Chine who should I meet but our old gardening friend, Mr. C. Orchard, manager of the Bembridge Hotel and gardens. With him was Mr. W. Drover of Fareham, well known as one of the leading Chrysanthemum growers. We adjourned to the Chine Hotel for lunch, and I soon found these gentlemen were on business, having to act as judges at the Shanklin Horticultural Show, held in the beautiful grounds of Ryleston, kindly lent by Mons. Spartali. At the outset I must say of all the local shows I ever attended I never was in such charming grounds and scenery. The grounds stand well up on the cliffs and overlook the

Chine Pier, the Spa Hotel, the splendid sands, on which you can walk to Sandown, some five miles, the beautiful white cliffs, distance about twelve miles, and the coast as far as the eye can see. I am told that on

a elear day one can see Brighton.

Passing to the tents I was very much interested in the exhibits. One tent was well filled with stove and greenhouse plants, including Palms, Zonal Pelargoniums, Ferns, Coleuses, Fuchsias, and very fine specimens of Araucaria excelsa, well feathered and clean, some of the finest I ever saw. The fruit tent most noticeable for the Grapes, Melons, Peaches; the Nectarines the finest seen this season. The cut flowers were good for the season, Show and Fancy Dahlias, Marigolds, Roses, Asters, ladies' sprays, and bouquets. The vegetable tent for professional gardeners contained good Celery, Cauliflowers, Tomatoes, autumn and spring Onions. The cottagers' tent was well filled. I notice by the schedule that no less than 120 classes in all are provided. Great eredit is due to the Honorary Secretary, Mr. A. Carter, and to the Committee for the efficient manner in which everything was carried out. I remained till the evening, when a promenade concert took place, and the grounds were lit up by fairy lamps. I enjoyed the concert with Mr. C. Orchard, who left me to go to Bembridge, and I went on to Ventnor, distance four miles, to prepare for the next day.

The following day I walked from the esplanade on the cliffs to Steephill Bay, which is a charming walk. On the right under the hill is Steephill Castle, late the county residence of Dudley Hamburgh, Esq. Following my walk I come to the Ventnor Hospital, which was opened by the Queen. This is a splendid block of buildings with about 12 acres of pleasure grounds attached and overlooking the sea. Still continuing my walk, I came through Bank End Farm, which is one of the prettiest and most compact farms under the undercliff. The front of the house is eovered with Roses, and of a mild scason Roses have been picked at Christmas. Mr. Truelove is now the occupier of the farm, and many years ago was the gardener and steward to the Hon. Mrs. Dudley Pelham of St. Lawrence. I then get in the high road, and walk along the undercliff, and come to the pretty church of St. Lawrence. This old ehurch is one of the smallest in England, which every visitor to the island ought to see. The gates being open, I walked round the little churchyard, when I saw on some of the tombstones names that took my memory back to my boyhood. I pass on for about half a mile, and then return for Ventnor, passing the new ehurch of St. Lawrence, which stands on high ground overlooking the sea. I then get to the Hon. Mrs. Dudley Pelham's gardener's lodge.

I introduced myself to the gardener, and was received by every courtesy. I found he was gathering Figs, which one could pick by the bushel. The kitchen garden lays well up under the Down, the extent being about 4 aeres. Apple, Pear, and Pium trees were broken down by the heavy crops. Wasps are very troublesome, and Mr. Norton, the gardener, showed me two great bottles he had emptied that morning going through the plant houses. I see plants are grown mostly for conservatory decoration, and they are remarkably clean. Vineries contain Black Hamburghs, Muscat, and Alicantes, which were well done. The Black Hamburghs were well finished, and had extra sized berries. Tomatoes and Melons are also finely grown. Chrysanthemums on the eut-back system look well. In the pleasure grounds Roses are well done here, having secured many first prizes at the Undercliff Shows. The grounds looked neat, and the beds very gay. Among the most noticeable were the beds of Henry Jacoby Pelargonium, the best I have seen this season. Many people have no idea what the Island gardeners have to contend with to get their manure and things carried to the places required. They have to hand-cart everything, which makes labour very hard. I leave my friend and return him many thanks, and arrive back to Ventnor for dinner and tea, highly pleased with my walk, and finish out my evening on the pier.

My last day I took a walk early in the morning, and found Mr. Sheath, the gardener to Mis. Mitchell, at Macrocarpa Gardens, Undereliff, near Ventnor, among his Begonias, which he has the finest selection of seedlings in the Island. Some of the blooms measure 6 inches over, of perfect form. Mr. Sheath tells me he started with Messrs. Cannell's strain, and keeps on improving both double and single. I pass on to a fine house of Black Hamburgh Grapes and Buckland Sweetwater, which are well finished. The stove plant houses contain some very fine specimen Crotons, Eucharis, Tree Ferns, Bougainvillea, and Stephanotis. Plants are largely grown for decoration to supply a charming conservatory attached to the house, overlooking the sea. The grounds are not very extensive, nor is the kitchen garden; but everything looked neat, and a credit to the gardener.

My next walk was to Messrs. H. Drover & Sons' nurseries. The Hillside nurseries are mostly devoted to cut blooms, and the grounds very neatly laid out. Mr. H. Drover was foreman and manager at the Lower Grounds, Aston Park, near Birmingham, for many years. Most noticeable were some very fine Cyclamens, double Primulas, and pot Roses. The St. Boniface Nurseries are eomposed of fruit houses, which are devoted to Black Hamburghs, Muscats, Buckland Sweetwater, and Alicantes. There are two long ranges of houses 125 feet, one being filled with Peaches and Pineapple Neetarines. These are well done and clean. The other part of the ground is filled with a good selection of vegetables to supply the shop, which is managed by the son. I must say these houses are built under the Down, and the soil looks nothing but hard rock and chalk. The view from these nurseries is the best I have seen, and if any gardener has the privilege of a three days' holiday I should advise him to take the same route, as I am sure the gentlemen I have mentioned would be pleased to see him. I return back by the

train to the pier head for the boat to Southsea Pier, where I stop two hours, finally securing a train at Portsmouth Station, and arrive home safely, feeling better for my holiday.—A LOVER OF SCENERY AND GARDENS.

MR. LAXTON AND HIS WORK AMONG ROSES.

UNDER the above heading a writer in your issue of August 17th enumerates the Roses raised by the late Mr. Laxton, and states "Roses were not overlooked, his first being named Charles Darwin, followed by Annie Laxton," and the article goes on to say that Duchess of Bedford was also raised by him. May I be permitted to point out that Annie Laxton is an 1869 Rose, and Charles Darwin came out in 1879, ten years later? Also may I say that Duchess of Bedford was raised by a neighbour of mine, Mr. Postans of Brentwood, and not by Mr. Laxton?—J. H. P.

NATIONAL ROSE SOCIETY.

In reply to Mr. Mawley I beg to say that my private circular was sent out on the 21st and 22nd July, and I repeat that the Secretaries were amongst the very first to receive it. Their public reply was in the Journal of the 3rd August. The objection to such a reply is in the fact that it is never advisable nor necessary to make a public question of shortcomings in the management or working of any society, but as the Secretaries think otherwise they must take the consequences of the subject being discussed in the gardening Press. Mr. Mawley, more hibernico, says "by rights" I should have entered into certain personal explanations in my circular. I purposely avoided any personal attitude in that paper so as to show no bias whatever. As I have already said, the result of the inquiry is satisfactory both in the character and number of replies.—Charles J. Grahame, Brightstone, I. Wight.

IN MEMORIAM-DEATH OF THE REV. J. M. FULLER.

ALTHOUGH not occupying a very prominent position in the horticultural world, there are many, especially amongst the members of the National Rose Society, who will hear of Mr. Fuller's death with the deepest regret. At his delightful vicarage at Bexley Mr. and Mrs. Fuller for many years successfully cultivated the Rose, and were frequent exhibitors at the local shows in the neighbourhood, and also at the National Society's shows. Indeed, of one of the shows in the neighbourhood, my fellow judge used to say—in sporting phrase—'Mrs. Fuller first, and the rest nowhere.' Mr. Fuller was a constant attendant at the meetings of the Committee of the N.R.S., and for some years had been one of its Vice-Presidents, in which capacity he frequently took the chair. He always performed these duties with the utmost courtesy and in the most businesslike manner.

Mr. Fuller was an erudite scholar and an active clergyman. He was kind and genial in his ways, and there is a large circle of friends who will greatly miss him, and in the N.R.S. it will be difficult to replace one who by his courtesy and geniality was ever welcomed.--D., Deal.

THE FRAGRANCE OF ROSES.

In my recent contribution to the Journal upon this special subject I unconsciously omitted the names of two highly fragrant Roses which should most assuredly have been included in my selection, viz., Caroline Testout and Viscountess Folkestone; the latter one of the most successful productions of the late Mr. Bennet, who should rank hereafter as one of the greatest rosarians England has produced. I much regret that his Roses were not more universally appreciated during his lifetime; but there can be no question that they have risen very high in popular estimation since his death. That such splendid acquisitions as Her Majesty, Mrs. John Laing, Lady Mary Fitzwilliam, and Grace Darling, most of which are exceedingly fragrant, are steadily increasing in popularity is a fact which must be sufficiently manifest to every earnest student of contemporary horticultural literature. Mrs. John Laing already ranks as one of the four leading Hybrid Perpetuals; but I think that Marie Baumann for perfect sweetness and faultless form, likewise I may add for matchless productiveness, should be assigned the premier place.

With what your contributor "Y. B. A. Z." says on page 146 of the value of Tea Roses as almost perpetual bloomers I thoroughly agree. Thanks to such admirable varieties as Souvenir de S. A. Prince, Belle Lyonnaise, L'Ideal, Gloire de Dijon, Cheshunt Hybrid, Gustave Regis, and Etoile de Lyon, I have been blessed with a constant succession of beautiful blooms from the end of April till the present time. One of my favourite Tea Roses is Perle des Jardins. I would esteem it one of our finest varieties, but for its very remarkable formation, by reason of which it does not open well. I may state that my recent incidental reference to the evanescence of Roses (in my Viola article, page 120), was concerned chiefly with certain utterly unsatisfactory and absolutely disappointing Hybrid Perpetuals of no value whatever, which should I think be relegated without mercy to the regions of oblivion; otherwise they should be denominated in the catalogues "Fine Weather

Varieties," and I think it should also be mentioned by their raisers

that they must be very carefully shaded from the sun.

I am glad to find so eminent a rosarian as Mr. Benjamin R. Cant, of Colchester, vindicating the supreme merit of Ernest Metz, a Rose which has a great future before it, if I have not deceived myself regarding its claims. Souvenir de S. A. Prince is another exquisite variety which has not yet received adequate recognition. Why it should be regarded as inferior to The Bride, I cannot conceive; for it is unquestionably a purer white Tea than its rival, and in other respects it is at least equally impressive.

I have been informed by the correspondent to whom I have referred, that exhibitors as a rule do not attach any importance to the presence or absence of fragrance in a Rose. Such, however, is manifestly not the opinion of Mr. Cranston of Hereford, who was first with Alfred Colomb at the National Rose Show. "Every Rose" he affirms (in his book) "should have fragrance;" and I think that his verdict should be regarded as decisive. Unquestionably there are many magnificent Roses, for the most part descended from Baroness Rothschild, which are incolorous; powerthaloss I adhere to may original theory that the are inodorous; nevertheless I adhere to my original theory that the absence of this attribute is, even in such instances, a serious limitation. -DAVID R. WILLIAMSON.

HORTICULTURE IN SOUTH AFRICA.

WE extract the following, written by a visitor, from the catalogue of Messrs. W. & C. Gowie, as it indicates horticultural progress in our

African empire:

This firm of seed and plant merchants, Grahamstown, has within the past few years secured a reputation throughout South Africa, and in the coming impetus to the fruit industry will take a great part. Mr. W. Gowie is a standing example of what may be accomplished by enterprise and unflagging industry out of small beginnings. He commenced his career as horticulturist by the purchase of an old garden of about two acres. This he completely trenched, converting it into rich ground for the growing of Roses and other flowers, all his work being distinguished by complete thoroughness. Then as demands upon him grew he leased a part of Oatlands Park Estate, and last year he and his brother, who joined him as a business partner, became proprietors of that estate, which occupies a large portion of the western slope of the basin wherein Grahamstown is cradled. Long may they enjoy the fruits of their enterprise. Oatlands Park is 1200 acres in extent. It embraces the whole of a well-wooded valley, and contains a variety of fine natural and ornamental scenery. Each slope of the valley is thickly covered with Mimosa trees and thick bushes, while the bed of the valley holds two or three large dams, overshadowed by large forest trees, and that portion of the stream not required for irrigation flows into a shallow basin, from the centre of which springs a cluster of tall Poplars. A long line of Gum Trees marks the boundary on the town side, and on the slope, opposite the house, a small space is reserved for the town. This is known as Prince Alfred's Park, the Duke of Edinburgh when a lad having, on a visit to the town, planted an Oak on that spot. That was when Oatlands was the property of Sir Walter Currie, a great sportsman and warrior, who formed that fine corps the original F.A.M. Police. The foreground in the illustration was at that time wild land, and some years later Sir Walter introduced therein the first pair of ostriches ever kept in a domestic state in the colony. No one of the many hundreds who saw those birds, however, dreamt of the use to which they could be put, and no effort was made to breed them for their feathers.

Now where the ostriches built their nests a garden glows in all the beauty of its Roses and budding fruit trees. Messrs. Gowie Brothers have, however, only as yet worked one corner of their fine estatz—that nearest the town—where they have some 30 acres completely trenched and well covered with flowers, ornamental trees and shrubs, and thou-

sands of young fruit trees.

In the foreground is a field of mixed Roses, thousands in number, from which, during the season, large numbers are despatched by rail and post to all parts of the country. The Rose thrives well in South Africa, and 1 saw many a small plain iron house in Kimberley and Johannesburg redeemed from ugliness by magnificent Roses. Beyond this glowing field of white and red there is on the right a smooth lawn interspersed with ornamental trees, and above that the glass houses for propagating, potting, including the Fern house, wherein is one of the finest and most beautiful collection of African and foreign Ferns I have seen, all flourishing splendidly, and most of them in demand for the adornment and beautifying of ladies' boudoirs. Out in the open near the signpost were trees of the English Hawthorn in bloom and rare plants usually found in hothouses, but here thriving in the open, one of them covered with a mass of white and scarlet bloom. Beyond to the left is the fruit nursery, where are some 15,000 young fruit trecs, comprising Orange, 30 varieties of Pear, 20 of Peach, 36 of Apple, 6 of Nectarine, 10 of Apricot, besides Almonds, Walnuts, and Medlars. Herc were 1400 grafts of Orange trees three and four years old, raised from the pip, and then budded or grafted, Mr. W. Gowie having completely mastered this art. Of course he has noticed the gradual growth of the export trade in fruit, and is turning his attention to trees which will produce the best crops for the London market, and has made a start with 2000 Apples, the "Late Bloomer," which yields a beautiful dark red fruit of fine flavour. There is no blight about the trees, they were clean, healthy, and just bent upon doing their work in the world by producing fruit.

There had been a great demand on Mr. Gowie for Orange trees, and he had almost sold out the whole of his stock of three and four year old trees, many of them going to Capetown, where a few years back the Australian bug had destroyed thousands of trees. I may remark that an enemy has been found to the Dorthesia in the ladybird insect, and at Uitenhage one gentleman has bred these insects with the laudable object of supplying them to owners of Orange groves threatened by the bug. In a few months the ladybirds will clear out the pest, lock, stock, and barrel, old and young, and then, having eaten the enemy, they settle the danger which might arise from a plague of ladybirds by eating each other.

THE PLATYCODONS.

My note on page 145 was written before I had seen Mr. E. Molyneux's article, or I would have referred to it at the time. I have no doubt the plant referred to by your esteemed contributor is the white variety of P. grandiflorum, and not the new white form, which is a seedling from P. Mariesi and is said to be exactly like the parent except

seedling from P. Mariesi and is said to be exactly like the parent except in colour. It was offered by Hillebrand and Bredemeier of Pallanza under the name of "P. Mariesi album," and in the catalogue is said to attain a height of "15 to 20 centimetres," (equalling about 6 to 8 inches).

For garden purposes the Platycodons may be divided into P. autumnalis, growing sometimes to nearly 3 feet in height, and flowering later than the others; this is blue. P. grandiflorum, sometimes 2 feet in height, although generally dwarfer. Of this there are the following forms—single blue, double blue, single white, and double following forms—single blue, double blue, single white and double white. P. g. nobilis with large pale blue flowers, and P. g. striatum, with striped flowers, are named in some continental catalogues, but I have never met with them in cultivation.

P. Mariesi will generally be found growing about 9 inches in height, and the form exhibited by Messrs. Paul appears to be an extremely dwarf one for the plant as grown in this country. Mr. Paul is quite correct in saying that P. Mariesi is from Japan. In the "Dictionary of Gardening," P. autumnalis is considered synonymous with P. grandiflorum, which is given as growing from 6 to 12 inches in height (?) P. Mariesi is given as a form of P. grandiflorum. The Platycodons are still occasionally met with under Schröder's name of Wahlenbergia .-S. ARNOTT.

PLATYCODON GRANDIFLORUM MARIESI.

In my notice of this plant on page 127 a mistake has crept in, which I attribute to transcribing my notes. The white form of P. g. Mariesi is a scarce plant growing not more than 6 inches high. P. grandiflora alba is the variety to which I alluded as growing nearly 2 feet high.—E. MOLYNEUX.

PLATYCODON MARIESI ALBA.

I BEG to enclose a plant of the Platycodon Mariesi alba mentioned by Mr. Molyneux in his notes on page 127 of Journal, which was also referred to on page 146, as being very scarce in England. I happen to have a few dozen plants which flowered well with me this year. The plant I send was cut quite close to the ground.—B. LADHAMS, Shirley.

[The specimen was 6 inches in height and appeared to have been flowering freely.]

ROYAL HORTICULTURAL SOCIETY.

SCIENTIFIC COMMITTEE.—At the last meeting of the Scientific Committee of the Royal Horticultural Society, D. Morris, Esq., C.M.G., occupied the chair.

Anthracnose (Sphaceloma ampelinum).—Specimens of Grapes from a garden near Dorking were exhibited suffering from this disease. Mr. G. Massee, of Kew, who determined the disease, stated that the Vines were affected by "a mild form of Anthracnose," which is caused by a fungus called Sphaceloma ampelinum, De Bary ("Bot. Zeit.," 1873). The fruit of the fungus is developed during the winter, hence before this period all diseased portions should be removed, and furthermore such portions should be cut well back, as the mycelium is perennial, and works backwards from the young shoots which it first attacks.

The Chairman stated that no one knew until a few weeks ago that this terrible Vine disease was in England; but now it was reported from an Edinburgh garden as well as from Dorking. In America the disease was most deadly, and it was also the source of much trouble on the Continent. Notwithstanding the above statement, it is possible that the disease has been lingering for at least two or three years in this country, as Mr. R. D. Blackmore, of Teddington, called attention to it at the Grape Conference held at Chiswick in September, 1890. In the "Journal of the Royal Horticultural Society," vol. xiii., p. 49, Mr. Blackmore said a disease which attacked his Vines, "resembled Anthracnose," although the symptoms were not quite identical. The tip of the shoot is first attacked, and the crinkles of the unexpanded loss which becomes of a dirty washlesther colour and loss its nelluleaf, which becomes of a dirty wash-leather colour, and loses its pellucidity; then the leaves that are expanded further down the shoot become cupped and concave on the lower side, convex on the upper, and lose their grailing. All the shoot becomes dull, and its crispness is gone; and if pinched it indents without breaking. The disease, unless checked at the outset, descends the stem very quickly, runs into the older wood, and destroys the Vine." The specimen submitted to the Committee had the canes, fruitstalks, and berries affected with dark brownish blotches and goods while the leaves were of a dull arraigh brownish blotches and spots, while the leaves were of a dull greyish tint, shaded here and there with brown on the under surface. As a remedy it was suggested that Vines suspected of the disease should be dusted with sulphur in the spring time, and later on a mixture of sulphur and lime should be applied judiciously. In some places on the Continent a wash of sulphate of iron is used for the stems. Any Vines now suffering badly from "anthracnose" should be immediately

destroyed by fire to prevent the disease spreading. It may be mentioned that Mr. Blackmore ("Journal Royal Horticultural Society") plunged an infected shoot into a can of strong liquid manure; and this arrested the evil, and after two or three such dippings sound growth was renewed. The manure should be undiluted and strong.

renewed. The manure should be undiluted and strong.

Primula Poissoni.—Mr. G. F. Wilson exhibited a plant with several flower-scapes, one of which bore six whorls of purple flowers.

EVENTS OF THE WEEK.—Apart from the four days' Show which opens at the Agricultural Hall, Islington, under the auspices of the Royal Horticultural Society, on Tuesday, August 29th, but few events of horticultural interest will take place in the metropolis during the ensuing week. A further reference to the Exhibition is given in another paragraph on this page.

- THE WEATHER IN LONDON.—After the abnormal heat of last week a change in the temperature has been generally welcomed. As mentioned in the leading article of this issue, 95° were recorded at Greenwich Observatory in the shade on Friday last; but on Saturday the thermometer fell to 75° in the metropolis. A little rain fell on Monday morning and also on Tuesday afternoon. Wednesday opened showery, and at the time of going to press the weather appears unsettled.
- AGRICULTURAL HALL SHOW.—On Tuesday, August 29th, the great Show of plants, flowers, fruits, and horticultural sundries will be opened at the Agricultural Hall, Islington, by the Royal Horticultural Society, and will remain open to the public until the night of September 1st. The members of the Fruit, Floral, and Orchid Committees will meet on the 29th inst. at 11 A.M. precisely, but will be admitted at the Barford Street entrance as early as ten o'clock. They are particularly requested to wear the badges given out at the last Temple Show, and to have their Fellows' pass or tickets with them. We are requested to state that as the catalogue of the Show must go to press on Monday, it is hoped that all exhibitors will have given particulars as to their exhibits by that day to the Superintendent of the R.H.S. Gardens, Chiswick, as otherwise they cannot possibly appear in the catalogue.
- Lady Bird Tomato.—Although I knew this to be in many respects an excellent Tomato, I was quite unaware until I saw it recently growing in a house at Messrs. H. Cannell & Sons' Eynsford Nursery what an extraordinary cropper it was. Growing here by the side of such sterling varieties as Cannell's Perfection, Ham Green Favourite, and Hackwood Park Prolific, it completely eclipsed them as regards weight of crop. The fruits are, however, not of such good shape as either Perfection or Ham Green, though they are equally as rich in colour. The growth made by Lady Bird is far stouter and more robust looking than any of the others, and the crop must have been at least twice as heavy. I am surprised that more is not heard of this Tomato, as to my mind it is one of the finest that has been introduced during the past three or four years. It was figured in the Journal for January 5th, 1893, at page 15.—H. W.
- MELON BLENHEIM ORANGE.—Now there are so many varieties annually introduced the value of this high-class Melon appears to be overlooked, but I am yet inclined to think that it ranks foremost in its section for all-round properties—namely, handsome shape and fine netting, high quality, good constitution, and free setting. I have a recollection of the fine fruits grown by Mr. Iggulden at Marston House some few years since on the extension system of training, many of them weighing 6 lbs. and upwards each. Cut from plants in full foliage they were unbeaten in the best competition. At Heywood its value seems to be fully appreciated, for calling there recently I saw one house devoted exclusively to this variety, the fruits averaging from 2 to 3 lbs. each. The plants were placed about 1 foot or so apart, and kept to single stems; and although this particular house is a small one, over forty fruits were swelling, and furnished with the perfect net so characteristic of the variety. It is good for growing in frames in summer under restricted treatment, but to see it in its best condition it should be grown on a trellised roof of a heated structure.—W. S., Rood Ashton.

- —— AN ANNUAL OUTING.—The employés of Messrs. William Cutbush & Son of Highgate, London, N., and Barnet, Herts, held their outing on Saturday, August 19th, on which occasion they went to Hastings, where an enjoyable day was spent.
- VINES IN FRANCE.—On account of the intense heat at Medoc and Bordeaux the Vines, says a correspondent, have become completely ripe during the past week. At the Château Margaux the Grapes are already being gathered. It is estimated that the heat has spoilt 25 per cent. of the vintage, which, in spite of this loss, remains unusually large.
- —— PINK ERNEST LADHAMS.—I send a few blooms of new perpetual-flowering Pink Ernest Ladhams, which is now as full of buds and blossom as in spring. I have never been without bloom since it was raised four years since, and it forces admirably. A recent storm has somewhat damaged the blooms, as the plants are growing quite in the open.—B. Ladhams, Shirley. [A beautiful border Pink with large fragrant blossoms.]
- TENDER AND TRUE RUNNER BEAN.—The public ought to be greatly indebted to Messrs. Sutton & Sons for the introduction of this splendid novelty. The seed resembles the ordinary French Bean. Canadian Wonder sown at the same time is all over. Tender and True is covered to a height of 4 feet with well shaped pods about the size of those of Canadian Wonder, and is likely to continue cropping until frost cuts it down. This Bean is likely to be much heard of in the near future.—R.
- A New Cactus Dahlia.—At the South of Scotland Horticultural Society's Show at Dumfries on 15th and 16th inst., Messrs. Dobbie and Co. of Rothesay exhibited a new Cactus Dahlia named Ivanhoe. It is the first of a new type, being single and having sharply pointed, somewhat twisted petals. The colour is a beautiful rose, and for decorative purposes it will certainly be much in demand. Ivanhoe is a charming novelty, and was greatly admired.—S. A.
- —— SIDALCEA PEDATA.—This was the most striking plant in an exhibit of hardy herbaceous flowers by Mr. Lister of Rothesay at the same Show. It is a beautiful Malva-like flower of a pretty blush pink colour. I can find no reference to this plant, but was informed that it grew about 3 feet in height. For exhibition purposes it looks as if it would be invaluable.—S. A.
- —— CARNATION LADY NINA BALFOUR.—This new Carnation was exhibited with a number of others by Laing & Mather of Kelso. They were arranged in bunches with their own foliage. Lady Nina Balfour is undoubtedly a beautiful flower of a most attractive pink colour, and if it possesses the qualities claimed for it by the firm distributing it will soon be widely grown. A bright scarlet self named Dundas Scarlet in the same exhibit pleased me very much.—S. A.
- HARDY FLOWERS AT DUMFRIES SHOW.—At this Show on 15th and 16th inst. six exhibitors competed for the prize for twenty-four spikes or bunches of hardy herbaceous plants. The first prize was awarded to Mr. J. Harper, gardener to Mrs. Maxwell-Witham of Kirkconnell, with a good collection, arranged in a most effective manner. Among the most noteworthy plants was the larger and better of the two forms of Rudbeckia or Echinacea purpurea. The second went to Mr. J. Wilson, gardener to J. Davidson, Esq., Summerville, who had perhaps more variety, but must have lost several points for arrangement. Third Mr. W. Carruthers, gardener to Capt. Stewart of Shambellie. In the class for six spikes the prizes went to Mr. W. Edgar, an amateur, and Mr. W. Carruthers.—S. Arnott.
- A NEW AGRICULTURAL COLLEGE,—The Kent County Council have completed the arrangements by which they propose to extend their scheme of technical education, by the establishment, jointly with the Surrey County Council, of an Agricultural College at Wye. The idea is to provide a centre for agricultural science and practical instruction, at which not only will instruction be given to resident and non-resident scholars, but from its professional staff will be drawn lecturers to visit the towns and villages of Kent and Surrey, while the College itself will become a seat of scientific research and examination of soils, manures, seeds, and products. The acquisition of the premises at Wyc was at the suggestion of the Earl of Winchilsea. The government of the College is vested in Lord Winchilsea, as Hcreditary Governor, nine representatives of the Kent County Council, six of the Surrey County Council, two of the Universities of Oxford and Cambridge one of the Royal Agricultural Society, and one of the Bath and West of England Society and Southern Counties Association.

— AMERICAN HORTICULTURAL JOURNALISM.—Our excellent transatlantic contemporary, *The American Florist*, keeps in the front rank of horticultural journalism "on the other side." Special issues are the order of the day, the "Convention and Columbian Souvenir" number being the latest achievement in this direction. This number is replete with illustrations, for besides some charming views of the horticultural exhibits at the Chicago Exhibition, no less than 416 portraits of horticulturists are given.

"IGGULDEN'S ANTIRRHINUM."—For a mass of pure white flowers for bedding I know of nothing to equal Iggulden's Antirrhinum. It has been in bloom the whole of the season, and appears likely to continue all the summer. It is important to keep the spikes of sced-pods cut off, not minding the sacrifice of two or three flowers and buds at the top; indeed, the plants are more even and compact after this operation, as a number of shorter spikes are ready to open their numerous flowers. I believe the variety is fairly well "fixed," so a stock may be raised from seed. I prefer, however, to insert cuttings in the autumn, wintering them in a cold frame, or, in other words, treat them like Calceolarias.—T. S.

— ALLAMANDA WILLIAMSI.—As an exhibition plant, this recent introduction of Messrs. B. S. Williams & Son must shortly take a high position. Darker in foliage and stem than most varieties at present in cultivation, a grand habit, and flowers stout in texture of a pleasing medium shade of ochre, it is particularly acceptable, not only for exhibition, but to supply cut blooms for decorative work. The plant is of upright growth, and in some instances stakes are not even required for support. Strong shoots taken with a hecl early in the season, and grown in 4-inch pots, make pretty little plants for grouping. As showing its floriferousness, I saw, a few days ago, a plant, 9 inches in height, grown to a single stem, and only in a 3-inch pot, which had a perfect head of growth bearing nine fully developed flowers.—R. P. R.

— HARDY FLOWERS AT EYNSFORD.—Those who are interested in hardy flowers would find that a day spent on Messrs. H. Cannell and Sons' seed farms at Eynsford highly enjoyable. Visitors are received and treated with the utmost courtesy, and a sight will be shown that is not, at any rate by Londoners like myself, to be seen every day. Here will be found large beds of the fragrant Alyssum maritimum, the gaudy Antirrhinum, and the more lowly, though not by any means less beautiful, Viola. Thousands of Asters are throwing up good sized flowers which present a very charming appearance, the colours being massed in a tasteful style. The soil on which these plants are growing is of a very light chalky nature, nevertheless they are doing admirably, and this after a dry season, is proof of the skill and unremitting attention to which Mr. Robert Cannell subjects them.—H.

— Blandford Horticultural Society.—In brilliant weather the above Society held its first annual Show on Thursday, the 17th inst., in the beautiful grounds of Bryanstone Park, the seat of the Right Hon. Viscount Portman, K.G., and the Society is to be congratulated on the success it attained. Mr. Allsopp secured the premier award with a very fine group tastefully arranged. Mr. Perkins, Milton Abbey, also exhibited a grand group of plants. Sir W. Marriott (gardener, Mr. Denny) sent a splendid group of stove and greenhouse plants, including some Orehids, amongst which was the chaste Catasetum Bungerothi (not for competition). Fruit was well shown in all classes, the principal prizetakers being Messrs. Martin, Allsopp, Perkins, Elsworth. Vegetables were well shown, Mr. Allsopp again winning the first prize. Amateurs and cottagers came out remarkably well, their exhibits being very fine. Mr. Pritchard of Christchurch showed a collection of herbaceous plants in flower, which added greatly to the beauty of the Show.—Visitor.

THE WAKEFIELD PANTON SOCIETY.—At the recent meeting of this Society, Mr. H. Gill of Leeds, son of Mr. Gill, one of the Vice-Presidents, read an extremely interesting and practical paper on "The Tulip." The author this year carried off first prize in the Maiden Growers' class at the Manchester Show of the Royal National Tulip Society, and also came in second for the silver medal in the open class. In his paper, Mr. H. Gill observed that as it was not the season for Tulips he could not illustrate his remarks by specimens, still as this was the time for those who intended to begin the cultivation of this beautiful flower, perhaps he could give them a few hints which would be valuable. He then dealt with the raising of seedlings, the preparation of the beds, and traced the steps necessary to secure success in the development of the bulbs, noticing the practice followed by the principal growers, and the points he had found of special importance in his own experience.

THE INTRODUCTION OF FOREIGN PLANTS.—"Garden and Forest" sums up a column of comments and quotations on and from some recent articles in "Garden Flora" as follows:—It would be difficult to compute with accuracy the total number of foreign plants now grown in northern Europe, every year adding, of course, largely to the enormous total. But to give some idea of what this total now may be we may quote Professor Kraus's statement that, while some 1500 flowering plants are believed to be natives of England, Sweet's "Hortus Britannicus" names as growing there in 1830 some 32,000 species. This means that even sixty-three years ago, before the prolific labours of the last two generations of explorers and importers, more than twenty-two plants had been introduced by man into England for one with which Nature had there supplied him.

- MONTBRETIA CROCOSMÆFLORA FLORE-PLENO.-The above named new plant, figured in your last issue, was raised and sent out by the well-known French hybridist, Monsieur Victor Lemoine of Nancy, from whom I received it towards end of last year. The first two flowers which opened on my plant were quite single, but those which expanded afterwards had all a double row of petals, so that the flowers can only be considered as semi-double, an additional proof of which is that several of them are now setting seed, which a fully double flower would hardly do. The flowers are very short-lived, each of them remaining open not more than a day and a half, so that those at the bottom of the spray usually closed before those at the top commenced to expand. This plant is interesting more as the first of a new race with double flowers than from its own individual merits, and considering what really fine and beautiful things Mons. Lemoine has already given us in this family, he may reasonably be expected to produce in the near future much better and more fully double flowers than those of the plant now under notice.—W. E. GUMBLETON.

- GRAPES AND TOMATOES AT SWANLEY.—It would doubtless astonish many people, as it did me, to see the Vines growing at Mr. Ladds' nurseries, from which Grapes are sent to the various markets for ten months in the year. House after house had been cleared of Black Hamburgh, and at the time of my visit Mr. Ladds was about to commence cutting Black Alicantes, than which I have never seen a finer crop. The bunches were of good size, and the finish of the berries left little to be desired. In one house, 500 feet long by about 18 feet wide, it was estimated that between 4 and 5 tons of Grapes were hanging. There were six houses of this size, all stocked with the same variety, and coming in in succession. No bunches are removed from the Vines, they been made to carry all they produce, and, despite the tax this must put upon their energies, good health meets the eye in every direction. One span-roofed structure, 700 feet long, is planted with Gros Colman, and the weight of Grapes must be enormous. The berries and bunches are of good size and finish, and the canes are cropped from within 18 inches or 2 feet of the border, right up to the ridge. This house alone is worth a visit to see, but it would not be all that Mr. Ladds, jun., could show. Tomatoes may be seen by the thousand, planted out in the borders of long low span-roofed structures. Roses, too, are cut here by the thousand every week, and this during the whole of the year.—NOMAD.

- KNIGHTON HORTICULTURAL SHOW.—The second annual Show was held in the grounds of R. Toller, Esq., Clarendon Park, August 17th, and as regards the exhibits must be considered a success. Vegetables in the amateurs' and cottagers' classes were excellent, and plants and cut flowers were also very creditable. There were a number of special prizes, which were very keenly contested, given by tradesmen. But perhaps the special prizes given by some of the members of the Committee are most worthy of emulation. They were confined to the children of the schools in the neighbourhood for bouquets and baskets of wild flowers to be arranged in the presence of the Committee, also for window plants grown by themselves. Mr. Wm. Bell, the Hon. Secretary of the Leicester Chrysanthemum Society, has taken great interest in these classes. He visited the schools at intervals during the summer and instructed the children in plant growing, and has thus instilled in the minds of the children a love for gardening, which we hope may be a pleasure and profit to them in after years. All these classes were very keenly contested by the children, and some of the exhibits were meritorious. Five groups (not for competition) were tastefully arranged down the centre of one large tent. Each group differed in character from the others, but none were crowded. Mr. G. Lawson, gardener to Mrs. G. H. Ellis, Knighton Hayes, brought his specimen Ferns, which were very much admired. The children in the special classes mentioned above brought 160 exhibits.

· THE ISLAND OF FORMOSA.—A report on the Island of Formosa by Mr. Hosie has been published as a Parliamentary paper. It is the first which has been issued in this country since 1886, and in the interval the island has become an independent province of the Chinese Empire. The agricultural products include Rice (two crops annually), Wheat, Millet, Indian Corn, Sweet Potatoes, and other bulbous plants, and various kinds of Yams. Bamboos and Lotuses flourish in the North, and the Ginger plant is freely cultivated. The Guava tree grows wild. Mr. Hosie says: "In respect of economic plants the island is indeed wealthy, but up to the present neither the native nor the foreigner has taken full advantage of the wealth." The other products include Tea (a black variety erroneously classed as green), camphor, sulphur, and tobacco. Two kinds of sugar are obtained, the most important being "Saeeharum sinense, Roxb." In conclusion, Mr. Hosie says that the trade of the island is woefully undeveloped. The bulk of the tea goes to the United States, and most of the sugar to Japan.

- WILD FLOWER COMPETITIONS. - Almost everywhere these competitions are to my mind very unsatisfactory. At one show I found not less than eighty-five bunehes of wild flowers staged in competition for three prizes, and though three others were awarded, there were seventy-nine unsuccessful exhibitors. In the corresponding class for baskets of wild flowers there were thirty-one exhibits, leaving twenty-six that were disappointed. A very interesting class, however, was one of wild flowers, dried and preserved in book albums. Three of these were exhibited, the contents well preserved but very indifferently named, not one botanically, and the common names more or less local or incorrect. I ventured later in addressing the visitors to urge that some local effort should be made, as I would wish to see it universally made in rural districts, to form classes for the instruction of children in the botanical and common nomenclature of wild flowers, as that would be educational and useful, whilst the present practice of asking for mere bunches did no good whatever .-- ALEX. DEAN.

- PERSHORE FLOWER SHOW .- This and the attractions which are associated with it provide one of the most popular holidays in South Woreestershire. The eighteenth annual gathering took place on 17th inst., and the result must have been eminently satisfactory to all engaged in its promotion. The Show was revived after an interval last year, and the new management, which then successfully commenced its career, has continued to extend and develop the attractions of the horticultural Show and the attendant entertainments. Their enterprise was fairly rewarded, the attendance being larger than last year, and numbering between 6000 and 7000. The pleasant grounds of the Abbey, again placed at the disposal of the Committee by Major Hudson, formed a pieturesque locale for the Exhibition. The Show displayed many points of excellence. Of the plants and flowers shown, Ferns, Coleus, and Fuehsias were thoroughly good exhibits. Begonias were ereditable, and Asters, Zinnias, Roses, and Dahlias were all good and well shown for the season. Fruit was on the whole excellent. The Apples were remarkably fine. The Kent fruit sent by Mr. Bunyard was well to the front.

- PROPORTIONAL PRIZEGIVING .- I beg to thank Mr. Cummins for the information respecting the ultimate apportioning of the prizes at Carshalton published under my reference to the subject of last week. The figures given stand as an admirable object lesson, and merit every attention. I looked for four prizes only, but six were awarded. Now had the six been provided on the ordinary system we should have seen the £5 divided about as follows—30s., 25s., 20s., 14s., 7s., 4s. The new method of apportionment given according to actual merit shows that the first prize is but Ss. 3d. more than is the sixth or lowest. The first and second prizewinners may grumble, but the lower winners have much to be satisfied with. Another excellent result of the system I uphold is that no prize awarded is higher than the relative merits of the exhibit require. Thus in this particular competition the first prize collection was 18½ points below the Judges' maximum, showing that there was room for half a dozen better exhibits to have come between it and the maximum. Who, in such case, therefore are entitled to complain? I do not understand that the general adoption of the system advocated would necessitate a greater number of judges, except that it would often compel a higher appreciation of the work involved, and keener examination. But very much of judging is done by poin's already, and in all cases a maximum being determined even for single dishes, or of anything, let the points be written on the backs of the entry cards, with the position of the collection, and the thing is done. It would really rest with the Committee to properly apportion the prize money .-

· THE BREADALBANE VINE.—In the article in your last issue (page 139) entitled "The Giants of Grapedom," which I have found very interesting, there is an incidental reference to the Breadalbane Vine, regarding which the writer desires farther information. I had the pleasure of inspecting this famous Vine several years ago; but the statisties then acquired would not obviously describe either its dimensions or its productiveness at the present time. It eonstitutes undoubtedly the prevailing attraction at the beautiful Killin residence of the Marquis of Breadalbane. I understand that the splendid Grapes produced by this Vine are annually distributed by the benevolent Marehioness among the hospitals and infirmaries of Edinburgh and Glasgow. Her ladyship is exceedingly popular in the former city, in whose charitable institutions she takes a deep interest. Her husband is at present the representative of the Queen at the General Assembly of the Church of Scotland. I have no doubt that the Marquis of Breadalbane's head gardener at Auchmore in Killin parish, Perthshire, would be very glad to give your contributor the required statisties regarding the world-famous Breadalbane Vine. If he desires mc to do so I will write to him on the subject .- DAVID R. WILLIAMSON.

- BERDIANSK GRAPES.—Berdiansk is celebrated in Southern Russia for the size and sweetness of its Grapes. The British Consul in Southern Russia in a recent report speaks of Berdiansk town as formed by Prince Woronsoff in 1842 on the low ground adjoining the steppe, and was originally probably washed by the Sea of Azof, the soil being entirely sand and shells, with brackish water everywhere within a foot of the surface. Plans were drawn up for the formation of gardens, and about 800 acres were offered to peasants and German colonists, on condition that they planted not less than 120 fruit trees or 2400 Vines per desiatine of 2.7 acres, a rent of $7\frac{1}{2}$ per annum per desiatine being levied. Sole ownership was granted upon condition that, in case of default, the land would revert to the town. Every available plot was soon taken up, and in a few years the entire space was transformed into well-arranged and profitable gardens. During 1888 this experiment was repeated by the Town Council. A quantity of land—about 500 desiatines —was sold by auction, and averaged £10 to £50 per desiatine, the terms being an annual payment of 6s. per desiatine for ten years, and the same conditions as to cultivation. No difficulty occurred in finding purchasers, and the necessary Vines and fruit trees were planted, and the gardens now present a very favourable aspect. The Vines thrive well, and already bear fruit, large quantities of ordinary garden produce being also grown. The descriptions of Vines principally grown here are the Chassla or Bernska, Chaons, Isabella, black and white Muscat, Burgonski, Arcitinski, and the Alexandra Muscat. The Vines give a greater yield on the low, sandy soil; but the more delicate kinds thrive better on the slopes in a clay soil. About 3000 Vines occupy a desiatine of land, and no manuring is practised, although, where experiments have been made with old Vines, manure has been found advantageous. The average yield of Grapes of the common kinds is about 10 lbs. per Vine, 36 lbs. producing about 2 gallons of wine. The superior kinds give a smaller yield. Prices of Grapes average from 1s. 8d. to 8s. per 36 lbs., and new wine from 3s. to 10s. per 2 gallons. The crushing is carried on in a primitive manner, and little attention is paid to sorting or cleaning. Bulgarian and German colonists go in from the country districts during the early autumn and buy up the wine, none being as yet exported. There are several large private growers, who take special care in the cultivation of their Vines and preparation of wine, and some good, sound wine can be generally found in their cellars. The bulk of the wine being of a light character (8 to 10 per cent. of alcohol), does not bear keeping; but where the superior kinds are properly cleared from the stalks and sun-dried a good, strong wine is obtained, which keeps well, and ean be bought at 12s. to 16s. per 2 gallons. No phylloxera or other Vine disease has yet been experienced at Berdiansk. It is estimated that some 1500 desiatines of land are under Vine cultivation amongst the various colonies and villages in the district, in addition to the quantity belonging to the town. Probably in a short time an outlet will have to be found for the surplus wine, as the quantity produced will be doubled, and the supply will be greater than can be consumed in the surrounding districts. The Vines seldom fail to give a good yield. The cultivation, therefore, is found to be lucrative; but it is five years before the Vine is in full bearing. The present production of wine at Berdiansk amounts to about 300,000 gallons per annum. The Vines during the autumn are bent down and well eovered over with earth to provide against the attack of the severe frosts. In the spring this is removed and the Vines cut down to 2 feet and 3 feet from the ground, and no more than five stalks or branches are allowed to remain, and these have necessarily four or five buds on each.

- A NEW ALPINE GARDEN.—The Horticultural Society of Dauphiny and the Tourist Society of the same district have combined to form an Alpine Garden at Champrousse at an elevation of 1800 metres; 500 to 600 plants are already planted. The garden says the "Illustration Horticole" is intended as a refuge for rare or interesting species whose existence in a wild state is threatened, and as an establishment wherein such species may be propagated for distribution.

- VIOLAS.—The Rev. David R. Williamson of Kirkmaiden writes to us as follows:-"I am greatly indebted to Mr. William Dean for his generous references to my recent article on the Viola in your issue of last week. What he says of my advocacy of the merits of this beautiful and durable border flower is all the more appreciated by reason of the fact that I do not know Mr. Dean either personally or by correspondence. I am much gratified to find that he coincides with my estimate of the Countess of Wharncliffe, which by reason of its satin-like texture and exquisite fragrance I account much superior to such varieties, however admirable in other aspects, as White Flag, Sylvia, and the Countess of Hopetoun, whose splendid attributes, nevertheless, I fully recognise. Each of these is exceedingly showy, and very floriferous. In Mr. Dean's interesting and instructive article on the 'History of the Pansy,' in the same excellent number of the Journal, he has a eulogistic reference to Mr. Cuthbertson of Rothesay, which is amply deserved."

- SPANISH CHESTNUTS.—In England the Chestnut has never been of much esteem as food. For long its propagation was left to chance, and it was not until the middle of the last century that it was first cultivated. It was principally used to provide hop-poles and pigsmast. On the Continent, however, and especially in Italy and Spain, it formed an important, and in some places the principal article of food. There are many ways of preparing the Chestnut for the table. Reduced to a flour, with the addition only of water and occasionally a little salt, it is cooked in various simple ways, as polenta, a thick porridge, farinata, a soup of less consistency than the polenta, or necci, thin round cakes baked between two flat hot stones, and to which a special aroma is given by placing a dried Chestnut leaf above and below the paste while baking. These are, however, in Tuscany, usually alternated with polenta, made of Indian Corn, or Wheat and Rye bread, in which case the amount of Chestnut flour consumed is reduced to one-third or one-fourth, according to circumstances. In the Piedmont Chestnuts are only used as fruit. In parts of Spain bread made from Chestnuts is in common use. When Chestnuts are not ground they are roasted or boiled either in water or milk .-- (" Vegetarian Messenger.")

- KINGSWOOD FLOWER SHOW .- This, the third Exhibition of this Gloucestershire Society, was a distinct advance upon its predecessors. Many good prizes were offered both in the open and amateurs' classes. In the former Mr. J. Cypher, Cheltenham, won the leading prizes in his usual excellent style, Mr. Mould, Pewsey, also showing well. No less than three silver cups, each valued at 5 guineas, were won by Mr. W. Rye, gardener to Captain Bellfield, Frenchay, who had a grand lot of flowering and fine-foliaged plants and Ferns. Mr. W. Bannister, gardener to H. St. Vincent Ames, Esq., also showed plants well. Cut flowers were quite a feature in the display, Dr. Budd's Roses being particularly good. Fruit was also of great excellence. The best collection of six varieties was shown by Mr. W. Nash, gardener to the Duke of Beaufort, Badminton, who had remarkably good Alicante and Muscat of Alexandria Grapes, a handsome Golden Gem Melon, good Peaches, Nectarines, and Figs. Mr. Bannister was second. Mr. Nash was also well first for black Grapes, his three bunches of Alicante being faultless. Dr. Grace and Mr. Doel were also successful in Grape classes. Apples and Pears were numerous and good, as also were vegetables generally. Messrs. Jullion and Cottle are the Honorary Secretaries, and they are to be congratulated upon the results, financially and otherwise, of their labours.—W. I.

THE DROUGHT AND CATERPILLAR LIFE.

It is remarkable how often we find Nature brings about a favourable change out of circumstances that appear unpromising, and this has been the case in some points with the drought of the present summer. Both in the country and in gardens hordes of caterpillars appeared on many plants and trees during May, and as the dry weather continued it seemed likely that they would be the cause of much mischief to a vegetation already languishing for lack of moisture. The dryness and the warmth together did indeed accelerate the development of some species, and sent them into the pupal state earlier than usual; but with regard to a larger number of caterpillars, as time went on, the result of the drought was manifestly unfavourable. Much moisture is hurtful to most caterpillars; an excess of dryness, however, tells against them, and, after the long absence of rain the condition of the leaves was such that caterpillars became unable to masticate them, and the warmth reduced the natural juices of their bodies, so that many of them died of inanition. Of course this dying off of caterpillars was more noticeable on trees and wild plants than on cultivated species, because these were often watered to some extent, when it was possible, and so the foliage or other portions of the plants were maintained in an edible condition. Hairy caterpillars, I believe, suffered less from the heat than did smooth ones, because the coat of hairs tended to diminish evaporation from the body.—ENTOMOLOGIST.

ONIONS AND POTATOES AT CHISWICK.

THE following members of the Fruit and Vegetable Committee examined these crops at Chiswick on the 17th inst.—Messrs. H. Balderson (in the chair), G. Wythes, G. Norman, G. Sage, J. Willard, J. Wright,

G. W. Cummins, A. Dean, and A. F. Barron, Secretary.

The Committee first inspected the different varieties of Onions which have been grown in the gardens this season, the general crop being exceptionally satisfactory, having regard to the drought and other Onion troubles so prevalent elsewhere. The rows of Onions are about 20 feet long, and there were fifty of them. The seed was sown on March 3rd. All the various sections of Onions were fully represented, but there could be no doubt whatever as to the unquestionable superiority of the globular forms over the old White Spanish type, with their somewhat flattened or hollow bases. The awards made were based absolutely upon the merits of the respective sorts as presented in the trial, and only the most striking were selected for honours. The following received three marks, the highest award the Committee can make at Chiswick. Awards of merit or certificates can only be granted at the Drill Hall, where samples of the respective sorts may be shown by the persons sending to Chiswick.

Southport Yellow Globe.—Very smooth, handsome, even; Giant

Zittau type, but finer.

Southport Red Globe.—Very fine, handsome, even, firm, a first-rate one; the best of all the red section. Seed of both from Deverill and Henderson, New York.

Suttons' A1.—This is of the medium Globe type, a very fine massive

handsome Onion, that was much admired.

Deverill's Cocoanut.—The finest and best of all the deep Globe or James' Keeping type.

Henderson's Prizetaker.—Also a very fine globular Onion.

Globe Madeira (Vilmorin).—A remarkably fine stock, showing the best sample of the trial.

Italian Tripoli.—The best of the white-skinned forms.

It is perhaps surprising to learn that several Onions that have of late made a reputation for weight did not obtain awards, but, apart from lack of distinctness, these varieties under ordinary culture

were far from being the wonders they are supposed to be.

Potatoes, of which there is a good trial, were next taken, but probably one-third of the sorts need another month to mature in, whilst not a few were of poor appearance. About a dozen were finally selected for cooking, the lifted samples being all that could be desired. These selected samples were all most admirably served, for Potatoes are always well cooked at Chiswick, and the full award of three marks was made to the following. Sutton's Triumph, and Windsor Castle, white round; Jeannie Deans, flattish white round; Lillie Langtry, red round; Early Regent, a now well known variety, and Redcliffe Seedling, long white kidney shape, great cropper. Some others full of promise will have to be seen and tried later. It was agreed that the Potatoes were exceptionally sound and good this season.

DIGGING AMONGST FRUIT TREES.

THIS practice cannot be too strongly condemned, yet it is persisted in, I believe, merely for the sake of appearance. If the ground is kept clean digging need not be practised; if trees are well managed the ground surrounding them should be a network of fibres induced by surface dressings of farmyard manure. Where digging has been regularly practised for years we may look in vain for fibrous roots. The roots are driven down beyond the reach of the spade into material that is driven down beyond the reach of the spade into material that is unsuitable for them, and need we wonder that the young shoots die back and the trees canker? Only recently I have been engaged in removing comparatively young trees practically fibreless that should have been in good condition but for the spade. With the roots of trees in sour, wet, or hungry subsoil I suspect "spraying" for a lifetime with blue French broth would not prevent canker.

If trees are to produce good crops of fine fruit they must be liberally fed at their roots. If farmyard manure is not available for periodical dressings, and the drainage from the farmyard cannot be had or other sewage, recourse must be had to artificial manures. A mixture of two parts superphosphate of lime and one part of nitrate of soda is simple and good, applying from 1 oz. to 2 ozs. to the square yard, according to the state of the trees, as far as the roots extend, judging the distance by the branches. This dressing may be given two or three times during the season, commencing early in spring. A more durable manure has been recommended in the Journal, and may usefully be repeated here: "5 lbs. of bonemeal, 2 lbs. of sulphate of potash mixed and applied 4 ozs. to the square yard." If applied in spring 1 lb. of nitrate of soda might be added to this mixture.—FRUIT GROWER.

STANHOPEA AMESIANA.

This new and beautiful Orchid was exhibited at the Drill Hall on April 25th by Messrs. H. Low & Co., Clapton, and it attracted considerable attention, the Orchid Committee of the Royal Horticultural Society awarding a first-class certificate for it. It is said to have been imported amongst some plants of S. Lowiana, which

PLEUROTHALLIS PUBERULA.

This species belongs to the section Spathaceæ, and is allied to the West Indian P. univaginata, Lindl., but its flowers are smaller and more densely arranged on the raceme. It was, says the "Kew Bulletin," sent for determination by Mr. F. W. Moore, Keeper, Royal Botanic Garden, Glasnevin, in January, 1892, and again early in the present year. The flowers are pale green with a little dull yellow at the base, and exhale a Hawthorn-like fragrance. The upper half of each sepal is finely pubescent.

VANDA TERES. ON SFORM ROYSTON MOJEAN

WHILST visiting the gardens at Cadland Park, Southampton, recently, my attention was called to a plant of Vanda teres, which had obviously been injured, possibly by coming in contact with the spout of a watering can. The plant after the accident apparently

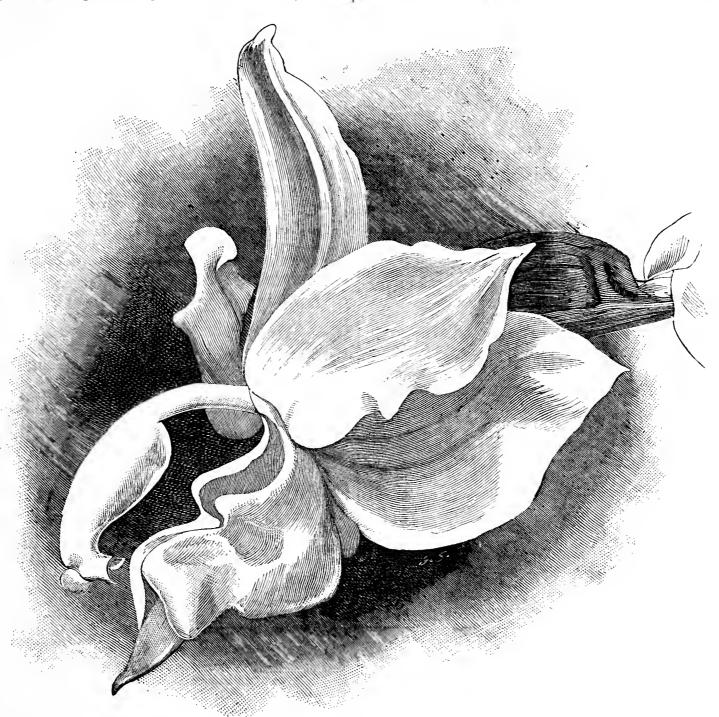

FIG. 26.—STANHOPEA AMESIANA.

as regards size and form of the flower it resembles. It differs, however, in colour. The flowers, one of which is depicted in the illustration (fig. 26), on the plant shown were very large, of an ivory or porcelain white. They were, moreover, deliciously fragrant, which enhanced them considerably. This Stanhopea is an acquisition, and doubtless will become a favourite amongst Orchid growers.

BULBOPHYLLUM SPATHACEUM.

According to the "Kew Bulletin" this species was introduced by Messrs. Hugh Low & Co. of Clapton, and flowered with Mr. James O'Brien of Harrow-on-the-Hill, Middlesex, in July, 1892, when it was sent to Kew for determination. It is allied to B. apodum, Hook, f., "Flora of British India," v. p. 766, but has shorter leaves and a much denser raceme, and much more slender membranaceous bracts. The flowers are light straw yellow, with a somewhat brighter lip. The base of the inflorescence is sheathed by spathaceous bracts, in allusion to which the name is given.

began to languish, and fears were entertained that it would die. Equal to the occasion, however, Mr. Garner, the gardener, bound moss around the growths in different places, and this being kept damp induced the formation of new roots from those points. By this means the plant was saved. Under such good management it will doubtless flourish and produce many beautiful flowers.—C.

VANDA CÆRULEA.

This is one of the most beautiful Orchids in cultivation, with its pale lilac flowers produced in October, and lasting in beauty four or five weeks. It is considered a cool Orchid. I have tried to grow it in a cool house, and was very unsuccessful. I then placed it in the East Indian house, where it commenced growing at once, producing roots from the stem and soon filling the basket. I grow the plant in an oak basket with dried sphagnum moss chopped fine and all the dust well sifted out, and one-third of crocks well mixed with the sphagnum. I suspend the basket close to the glass under one

of the ventilators in the roof of the house. When the plant has rooted into the sphagnum and is making its growth it requires abundance of water and plenty of air with a moist atmosphere, and when growth is completed very little water is needed during the winter months. The sphagnum must not be allowed to become too dry, or the plant will shrivel and lose its lower leaves.—Specialist.

WASPS:

DESTROYING WITH TURPENTINE-QUEENS.

I QUITE agree with "W. R. Raillem" that the use of gas tar is the easiest, cheapest, and best method of destroying wasps' nests, provided you can do so from above perpendicularly; but suppose the nests to be in the bank of a river, how then? My extensive rosarium, about 80 yards long, area 40 poles, is situated on the bank of the mighty river Hiz. Perpendicular fall of the bank 18 inches, depth of water 10 inches, width of river, average, 6 feet. There were four wasps' nests in the bank this year, about 6 inches above water level. These were destroyed by a piece of rag well saturated with spirit of turpentine being thrust into the holes, and then set on fire at night. Next morning the nests were dug out and burnt. Cost of turpentine 6d., rag an old pockethankerchief.

At all early flower shows, i.e., before the end of June, I would suggest a prize should be offered for the largest number of queen wasps exhibited dead, killed in the current year before date of the show, this would exclude museum specimens.—H. F. LLAG.

WASPS AND BENZOLINE.

THE wasps are doing so much damage to the orchards in South Lincolnshire that fruit growers have been obliged to gather the fruit before it is ripe, thus incurring considerable loss in their sales. At Quadring, the mail cart, which runs between Spalding and Donington, was attacked by a swarm of wasps, and the horse and driver were stung so severely that they were unable to proceed on their journey, and the mails were delayed for over an hour. Shopkeepers, whose windows are infested with the insects, have found a benzoline spray to be an effective means of extirpation.

WASPS AND TOMATOES.

Mr. Thorne, gardener, The Bush, Walton-on-Thames, informs us that he established Tomatoes in pots for growing up and over the front ventilators of the vinery purposely for excluding wasps. The air filters through the Tomatoes, but the wasps remain outside. There is quite a plague of them, and they are devouring all kinds of fruit within reach. In the absence of the Tomato barrier the vinery was "full of wasps." A gentleman informs us of a case of wasps devouring Green Gage Plums; some of these he placed in a small open conservatory among Tomatoes in pots, and there they were safe, as no wasps enter the house.

WASPS AND MUSLIN.

A SUSSEX correspondent desiring to protect ripe Figs enclosed the fruit in muslin, but the pertinacious wasps atc through the muslin and finished the Figs.

MACDOUGALL'S SMOKE FERRETS.

I Do not see that any of your correspondents who are suffering under this plague of wasps have mentioned MacDougall's "smoke ferrets," which I look upon as the simplest and most effective destroyer of wasps' nests that I have met with. I had in my rockery what seemed to be a tolerably strong nest, I therefore applied in the first instance some cyanide of potassium. This killed a considerable number; after a few days the nest was as strong as ever. I therefore one night lighted one of these smoke ferrets and put it into the hole, closing the entrance. In about half an hour's time the nest was dug out and a gallon of dead wasps was taken out, besides six large pieces of comb full of larvæ.

Many nests have since been taken by it all around me. It derives its name of smoke ferret from the fact that it is used instead of that unpleasant animal for the purpose of driving rabbits out. A lighted tube is placed in the run and bunny very soon bolts.—D., Deal.

JUDGING AT FLOWER SHOWS—WHAT IS AN EXOTIC?

At the Cardiff Flower Show last year I had occasion to blame the Judges for giving the first prize to a "collection of cut flowers, hardy herbaceous perennials, twelve bunches, distinct varieties," which contained Roses, Hydrangeas, and some other woody plants: and this year I have reason to find fault with the Judges for disqualifying a "collection of cut flowers, twelve bunches (exotic) distinct varieties," for containing a bunch of Anemone japonica alba. With this I send you a copy of the Society's schedule so that you can see the wording for yourself. Anemone japonica alba—if I mistake not—was introduced from Japan by Fortune, and is not indigenous to this country, and therefore must be an exotic to all intents. If the wording of the schedule had been "tropical exotics" I could have understood their decision; but as it is, I must say I am surprised at the Judges, especially one of them who hails from London, showing such a lack of knowledge of our English etymology. What do you think, Mr. Editor?—A. Pettigrew, Castle Gardens, Cardiff.

[We think the Judges were wrong both last year and this. We also think the wording of the schedule distinctly open to improvement in more than one class.]

CHRYSANTHEMUM FOES.

The diagrams of eelworms and text on page 129 must be of vital interest to all in this department, and we cannot but feel grateful to Mr. Abbey for revealing to us so subtle an enemy. Perhaps he and the Editor may be induced to supplement it by bringing us in like manner face to face with that "small weevil-like creature" which cripples the tops and our hopes at the same time. Given a good fat caterpillar or earwig there is something tangible to get between your thumb and finger, not to mention the exquisite pleasure (not to the beastie) of giving him the coup de grâce; but science alone can give us dominion over these microscopic foes. To this end she straps Vermorel pumps on our back and stocks the seedroom shelf with Kilm-Wrights (nothing personal) and other ingenious aids from her laboratory. One lesson I learned last season about this "worm i' the bud" is not to let him get there; dredge the tops freely with tobacco powder while healthy. The result has been that crippled tops this season are reduced to a minimum. Another lesson learned this season is that Mr. Molyneux's remedy (lime and sulphur solution), as given in his admirable book, is harmless to the roots, and can be used in safety at this season, if required, without unfastening tall plants to lay them down. This I tested by watering some plants with the mixture as diluted for syringing without any bancful results. I will not further trespass on space lest I incur the reproach that "Ireland blocks the way," but I do hope the ball will be kept rolling in that "fair field for discussion" the Editor generously provides.—E. K., Dublin.

CHRYSANTHEMUMS AT HEYWOOD.

As a West of England grower Mr. Robinson, gardener to Lord Justice Lopes, has acquired more than local fame, his success last year at several shows, including Devizes, Bath, and Bristol, being above the average, and he is, therefore, looked upon as a strong rival competitor to many who visit the above named and other shows. Judging from the present appearance of his plants there is every prospect of his credit being well maintained, if it does not even supersede that of 1892. The buds are evidently being well timed by the usual course of pinching and cutting down, according to the variety, during the spring and early summer months, and the manner in which the buds are setting, their free growth, and healthy appearance of leaf and stem proves they are judiciously and systematically treated. I was struck with the high quality of many of the varieties of recent introduction numbered among the collection of some 450 plants grown principally for large blooms. Several of the better known novelties are represented, not by solitary plants, but with from four to six of a sort, and as these are forming their crown buds in succession new varieties will sure to be a strong feature in Mr. Robinson's stands during the coming contests.

Colonel W. B. Smith is wonderfully promising, and is represented by six uniformly healthy and vigorous plants; so also is Lord Brooke. J. Shrimpton, W. Seward, and G. W. Childs, the new Cullingfordi scedlings, are each strong, and bid fair to give large blooms in due time. Duke of York, Edwin Beckett, W. Tricker, J. P. Kendal, John Dyer, said to be an improved Kate Mursell; Coronet, Waban, Golden Wedding, R. C. Kingsten, Mrs. C. H. Payne, Robert Owen, J. S. Fogg, Mrs. E. D. Adams, Mrs. Gov. Fifer, Tuxedo, Le Verseux, Mrs. Nisbet, E. G. Hill, Beauty of Castlehill, and Beauty of Castleford, are all in the finest possible condition. Mr. Robinson had perhaps the finest specimen bloom of Viviand Morel last year seen in the west of England, and his plants (several of them cut down in April) look well now. Its sports, Chas. Davis and Mrs. W. R. Wells, are equally vigorous. Of older sorts, E. Molyneux, Sunflower, Mrs. Wheeler, Mdlle. M. Hoste, Mrs. Falconer Jameson, Florence Davis, Gloriosum, Etoile de Lyon, Avalanche, Stanstead White, and Mdlle. Lacroix may be mentioned among many others, all in the same enviable state of health. The hairy petalled varieties are well represented. Of Mrs. Alpheus Hardy there are a dozen plants in various stages of bud development. Queen of the Hirsutes, Louis Boehmer, and its white sport were noted as doing well.

Some of the incurved showed much disposition to flower in the early summer months, but by cutting down a goodly portion of the Queen family this failing was outgrown. These are comparatively dwarf, but the "Princesses" are most of them 8 feet or more in height, and it is computed that by the time the flowers are open a large portion of the stock will cover 12 feet stakes. No mildew is to be found, consequently with the very close personal attention given to the smallest detail, the foliage is perfect almost to the pots; the bright sunshine, too, which we have known only too well this summer has given them the beautiful tint that bespeaks perfect maturity in the stems.

Now that the buds are forming rapidly, feeding with artificial manures will commence in earnest, Clay's and Thomson's commanding the largest favours at Heywood. Soot water has been the principal stimulant used since the pots were filled with hungry roots, with occasional weak doses of liquid manure as a change. No artificial of any sort had been used by the middle of August, save that mixed with soil at potting time, and the stout stems, vigorous foliage, and perfect colour betokens unusual effort in attending to the daily needs of the plants.

No less than four times each hot day have they been examined for watering, and the shortness of the supply has given much additional labour in carting from a distance, as it has done in numberless other gardens throughout the country.—VISITOR.

THE CHRYSANTHEMUM IN JAPAN.

In the "Transactions of the Massachusetts Horticultural Society" (part i. 1893) recently received there is a paper by Mr. James Comley of Lexington, entitled "A Visit to Japan." Unlike many of the travellers to that interesting country, Mr. Comley appears to have arranged his visit so as to spend the latter part of the year in Japan, and as a consequence his paper contains many allusions to the Chrysanthemums which he evidently saw with much advantage to himself and with interest to his real area. As the Transporting of the himself and with interest to his readers. As the Transactions of the Society referred to are not very accessible to Chrysanthemum admirers in this country, I feel Mr. Comley will excuse me making several copious extracts from the record of his visit to the Land of the Rising Sun, as I am well assured that many readers of the Journal will appreciate to the full much of the matter selected. He arrived in Yokohama on the 3rd November last year, and in the Cliff Gardens of that city had his first experience of Japanese Chrysanthemums, where, he says, he saw dwarf figures composed of Chrysanthemums representing all kinds of character. A visit was then paid to the Yokohama Gardens Association, an establishment covering 200 acres of land, which he tells us has the most beautiful collection of its kind in the world. The Chrysanthemums were grand, from 600 to 800 varieties being on view. Among these were about seventy altogether new varieties which he obtained, all wonderful in colour and shape.

Mr. Comley adds that he visited every place of note in Yokohama where he might expect to find a Chrysanthemum, and discovered one or two new varieties in each place. These were generally obtained on the spot, though this he explains is not an easy thing to do at all times, an experience in which the late Mr. Robt. Fortune would have concurred had he been alive. With genuine American shrewdness he tells us that many of the natives will not sell anything in their handsome grounds, and that the gardeners of the gentry who are dignified with the title of noblemen have to be conciliated by a little stratagem and use of

At Tokio, where the Palace of the Emperor is situated, Mr. Comley saw one of the best collections of Chrysanthemums in Japan. Imperial Gardens are difficult of access, but he managed to obtain a sight of this great home of the Japanese flower. At Davgozaka it has been the custom for many years to arrange Chrysanthemum blooms to represent notable persons, birds, or animals, or to tell of some event in history. As the visitor approaches from the street flags and banners seem to invite him, and the showmen tell of the great skill they have The costumes of the figures are composed of Chrysanthemums, the faces are carved in wood or plaster, the whole being realistic in appearance. The construction of these models is most interesting. First, a frame of bamboo of the required size is made, and the plants growing in pots are arranged in the rear of this frame in such a manner that neither stems nor pots can be seen from the front. Then the blooms are drawn through, and arranged in artistic fashion among moss on the front of the frame. These models last for about a month, and old and young go to view the show, which is considered one of the great events

By way of supplementing Mr. Comley's observations above it may be added that in Mr. Piggott's work, "The Garden of Japan," published last year, there is an illustration of one of these built-up floral models, entitled the "Seven Gods of Happiness," from a photograph taken at Davgozaka by a member of the British Legation. This writer tells us that the Chrysanthemum is the last of the "four gentlemen"-Shi Kunshi-so called for the qualities of which they are typical: the four are Mume, the Plum, vigour and sweetness; Ran, the Orchis, grace in adversity; $Tak\acute{e}$, the Bamboo; and Kiku, the Chrysanthemum, the emblem of To Ye Mei, a distinguished Chinese official, who many centuries ago retired from the Government service on account of its corruptness. Mr. Robert Fortune refers to this peculiar phase of Chrysanthemum culture as being practised by the Japanese florists, but I am not aware of any book but Mr. Piggott's in which an illustration

of it is given.

To return to Mr. Comley's paper, and I must continue as far as possible to quote his own language, for it is impossible for me to attempt to improve upon it, he says: "One morning going out early he came to a tea house, and there saw growing in the yard a magnificent collection of Chrysanthemums. There were four pretty Japanese girls sitting on the verandah of the house, and he asked permission to step in to look at a particular flower more closely. After some display of bashfulness he was admitted, and after he had taken tea and praised the flowers, the young girl who seemed to own them took up the specimen he most admired, reserved only a side shoot for herself, and he became the happy possessor of another novelty."

From there he proceeded to Kioto, where he found the best Chrysanthemums. They were to be seen in every garden, and he secured some very interesting varieties, among which were many varieties of an entirely new class. While in Kioto this enthusiastic and successful American Chrysanthenium hunter went to Sacco, a hundred miles distant, to visit the finest Chrysanthemum Show in Japan. In this Show we are told there were thirty different classes of Chrysanthemums all arranged in booths built of bamboo, each class by itself. Specimen plants were grown in almost every conceivable shape, and few people can realise his surprise at this marvellous display

after all the wonderful shows he had seen in Japan. Again, he inquired if he could purchase some of these gorgeous varieties, but was refused, and it was only after convincing the people that he wanted the plants for private use and to take out of the country that he was allowed to have some.

Pointing out some of the varieties he wished to possess he was told he could not have any of those on view but must select from others growing on a plot of land in the rear of the Exhibition. "Imagine my further astonishment," says Mr. Comley, "when a bamboo gate was opened and I saw over a quarter of an acre of land literally covered with plants, all named, two or three of every kind and more of some: Many of these plants were from 7 to 8 feet high with flowers from 7 to 14 inches in He went over the whole place, row by row and when he had finished he had no less than 175 varieties, after which he returned to Kioto well pleased with the result of his expedition and hastened to send off his treasures to Boston. He collected many other plants, but his collection of Chrysanthemums during the time he stayed in Japan amounted to about 400 varieties, amongst which, no doubt, are some wonderfully fine sorts at present unknown to American or European growers, and which we may possibly hear something further of during the next few seasons. Such a ransacking of Japanese gardens would suggest that the Americans are now in possession of everything from Japan in the Chrysanthemum line that is worth growing, but a few more observations from Mr. Comley will show there is still more room for Towards the close of his paper he says "Long as I future exploration. have cultivated the Chrysanthemum I had never seen a flower until I went to Japan where everyone loves it. I visited five hundred places where the flower is cultivated, and these were only the principal gardens in a few of the large cities."

It has been my pleasure to read many accounts, moré or less extensive, of Chrysanthemums as grown in Japan; but never until I came across Mr. Comley's charming paper have I experienced the delight of reading a personal sketch by a man well versed in the popular autumn flower. The ordinary traveller who describes Chrysanthemums hardly understands the subject sufficiently to do it justice, but Mr. Comley is a specialist and a grower, and resides in a part of America where Chrysanthemums are well understood, and the readers of the Journal of Horticulture will share with me the feeling that his "Visit to Japan" is too good an article to remain locked up in the Transactions of the Society to which he has contributed some of the most interesting and instructive material extant. That is my only reason for laying his article so heavily under contribution, and as an enthusiastic Chrysanthemum admirer he will, I feel sure, accept generously my excuses for

having done so.—C. H. P.

OUR BIRDS.

Mr. Duffryn's (page 145) are undoubtedly a thick cloud of witnesses, and, strange fact, all of whom testify evilly of my poor sparrows. Sparrows, too, are recompensed much the same way as generally are his lords and masters—whilst good deeds are ignored and forgotten, little mistakes are treasured up and remembered continuously. This regretable custom I suppose the sparrow also will have to submit to. Fortunately, quite in ignorance of these black clouds that apparently in waterspout fashion were to clear the way of all who dared to contradict, this season I, with all attention and seriousness, have been testing the sparrows' claims to a retained nitch in wisdom's huge diversity. Sustained by evidence that has been overwhelmingly favourable and singularly conclusive, the sparrow once more has demonstrated

in a way that admits of no contradiction.

In the open country to fruit growers the sparrow is an untiring friend and a determined adversary of their worst enemies. But has our Editor not been taking the sparrow into his confidence? has he not just allowed him to have one little peep where lay hidden away these multitudinous wrathful accusations? warned him to be on his best behaviour, and especially to look well after Mr. Witherspoon's Apples? But let the understanding have been what it may, this fact remains to the credit of the sparrow, whilst the Apple caterpillar appears in shoals morning, noon, and night. "They at them," and the happy result is I have the heaviest crop of clean beautiful Apples that I have ever seen. However much the friends of birds may be in a minority I am now more than convinced that truth lies their way. fortunately, my grand fruit crop has not only been preserved, but I also have had the good fortune to call in witnesses, and whose evidence will be forwarded to you in good time. My faith remains unshaken, that Nature's laws and all created are wondrously adapted to balance to restrain extremes. That there is a useful purpose and place for all, only selfish, short-sighted man refrains from tampering with machinery so effective, yet subtle, designedly framed to move man's brains and to equal him to whatever may be the responsibility or station that he may occupy.

As Mr. Verrall lives in the outskirts of a populous town, and worse,

keeps his sparrows confined in an aviary, judgment formed under such conditions can hardly be trustworthy. But as this witness seems to get badly on with birds in general, perhaps my relating to him a practice I follow with children might be of service. During the many years that I have grown fruit my garden gates have remained continuously unlocked, with the result, to my advantage, a mutual code of honour seems to exist between Apples and schoolboys which it is just possible with somewhat similar treatment his ill-brcd jacks, starlings, and

sparrows might imitate.

Next Mr. Duffryn's imported "cloud of witnesses." Just fancy, the

sparrows that requisitioned passing railway trains and utilized them as private nuterackers being told off as "little slavies" to do drudgery. No, no, the situation was taken in at a glance, and never was British honour entrusted in safer hands. "Miss Jonathan," no matter how gaudy may be her feathers, must again lay her airs to one side and recommence her own "grubbery," as, imported sparrows, be they English, Irish, or canny Scotch, are British subjects all; by nature were never intended, and never will be slaves. Some day, experience gained by also importing rabbits to where Nature saw no need for them, may prevail upon man to cease to tamper with arrangements that in ages long past were pronounced both perfect and good.

Charge No. 1.—Here, I must be a learner, as I have never been out of the United Kingdom; but, if referring to at least an arm of our pugnacious British family I am rather inclined to think that the charge will be true.

Next charge No. 2. "The sparrow as an enemy to gardeners and fruit growers." We read American scraps when in search of the mighty "tall." My over sixty years of British experience perceives that this structure has been drawn out at the expense of its stability; it is so overcharged with pure unadulterated "bosh" that it entirely misses the object aimed at.

No. 3, "The sparrow as an enemy to Grape culture." I have seen hens, ducks, blackbirds, and grey birds all enjoying the gobbling of Grapes, but in England to lay such a charge to a sparrow is as unfair as it is untruc; it is preposterous.

No. 4, "The sparrow as an enemy to grain growers." The mighty army of sparrows engaged in the scavenging work of large cities results in a heavy tithe been taken from those who foolishly grow in such situations; but of the open country this charge, too, is seriously overdrawn, and I must demand that it be amended by being based on the "country average."

No. 5, "Failure of the sparrow as an insect destroyer." With all respect to Miss Ormcrod and Mr. Gurney, jun., I must beg to repeat that my experience as a born gardener entirely differs from theirs, and I also claim that the faith that possesses me has for its foundation most careful and deeply interested observation.

Mr. Smith's reference to the march of civilisation reminds that it is such march that has destroyed that natural balance that he also refers to.

To "W. J. B." just a word of counsel. Stand to your guns, and warned by Carlyle's reminder, never turn faint-hearted when the hands held up leave truth in a minority.—JOSEPH WITHERSPOON.

P.S.—May I append the following letter, which has been sent to me by Mr. W. J. Watson, Newcastle-on-Tyne:—"No one interested in fruit growing in the north can fail to be impressed with the extraordinary crop of Apples your trees are bearing this year. The quantity and quality of the fruit on your Lord Suffields, and one or two other varieties, emphasises, in my mind, the wisdom of limiting the number of varieties planted, and you would be doing a real service to the public if you would, from your practical experience, state, say the half-dozen varieties you have found succeed best with you."—J. W.

ROYAL SCOTTISH ARBORICULTURAL SOCIETY.

It is nearly forty years since the above Society was established, and the annual excursions of the members have always been a prominent part in the programme, productive of much technical information in the science of forestry. This year the Society was successful in obtaining permission to visit Windsor Castle, by favour of Her Most Gracious Majesty. Every arrangement possible was done by the Council to make the trip a great success. A special train with seven saloon carriages was engaged for the party from Edinburgh, which numbered about 150 persons. Perhaps on no previous occasion has an equal number of horticulturists or arboriculturists been so luxuriously provided for, and the officials of the Society deserve to be congratulated upon the activity and zeal.

The trip, which occupied ten days, left Edinburgh on August 7th and travelled, as mentioned, to Windsor on that day. The royal mews were first inspected under the guidance of Mr. John Manning, the superintendent of Her Majesty's horses and carriages, and were much admired. The royal stables occupy four and half acres of ground and nearly 100 grooms are employed. The party then entered the Castle, visiting the Vandyke and other rooms, and much enjoyed an inspection of the magnificent historical paintings, statuary, and rare works of art from many lands. Grinling Gibbons's wood carvings were especially admired. In the grand vestibule are the addresses which Her Majesty has received in every form of casket from her subjects; all are carefully preserved. Here also are many of the Jubilee trophies. The throne room with the ivory chair was inspected, also the grand reception room with its splendid tapestries, as well as the Waterloo Chamber and St. George's Hall; two oak chairs appeared to be of special interest, one from oak grown on the field of Waterloo, the other one from Alloway Kirk in Scotland. The presence chamber was last inspected, the tapestry here being splendid. Several objects were pointed out by the guides, especially that of raising the tower to its present height, and it was stated that George IV. spent 14 million of money in making the Castle what it now is.

The party was next met by Mr. Owen Thomas, Her Majesty's head gardener, and conducted to the east terrace, where the flower

garden was inspected. It is a fine combination of the Italian and French styles made in the time of George IV. Thujas and Cupressus are trained pyramid in shape, and these formed an effective combination with flowers, which the most fastidious could not but admire. The terrace battlements of the Castle overlook the flower garden, and bring the whole under the vision. Near to the flower garden is a Cedrus Deodara planted by Prince Albert, and a fine tree of Paulownia imperialis, Chestnut-like in flower, and somewhat similar in perfume. The Castle slopes were next visited where Her Majesty takes her drives in her favourite pony carriage. These are principally planted with Beeches, Holly, Elms, and Spanish Chestnuts, and were re-arranged under the guidance of the Prince Consort. A wild rock garden is picturesque, being made out of an old quarry. Near to here is a fine specimen of a stunted Oak of the Norman period. It girthed 36 feet in circumference. A curious Beech tree of interest to arboriculturists was next seen. This was raised from the Martin Luther tree, and brought from Germany in 1825 by King George IV., when he was the Duke of Clarence. An Oak planted by Queen Victoria on September 12th, 1863, as marking the spot where stood Herne's Oak, which was blown down the same year. On the home farm are some very old Oaks decaying, but all arc specially taken care of.

The private grounds of Frogmore are seldom open to visitors, but the Royal Scottish Arboricultural Society were fortunate in having no obstacle to bar their visit. The first object of interest here was a grand kiosk from the Kaiserberg, Lucknow, sent by Earl Canning, the first Viceroy of India. A fine specimen of Taxodium distichum, 8 feet in girth, was inspected here; also were several trees planted by Royalty. The extent of the glass for forcing fruit and vegetables is $4\frac{1}{2}$ acres. There are 31 acres for vegetables inside the walls and 20 acres outside. There are 150 men employed.

The Show farm was next inspected, the farm breeds and cows and draught horses all receiving attention. Windsor Park and Forest were next visited. The great Vine at Cumberland Lodge was also inspected. The vinery is 138 by 18 feet, and this year there are about 1770 bunches on the Vine, the age of which is 110 years. The bunches on the young wood will average from 2 to 3 lbs. weight each. A quick drive then brought the party to the Virginia Water, a fine sheet of water, the largest artificial one in England, covering over 130 acres. It was formed in 1790. Belvedere Fort was next visited, where a tea had been provided by the thoughtfulness of Her Majesty, which was much appreciated. Afterwards, to commemorate the visit, a tree of Abies Albertiana was presented by Mr. Alex. Milne of Messrs. Dickson and Sons, Hanover Square, Edinburgh, which was planted, several members rendering assistance. A beautiful drive to Windsor brought the party back, passing en route the Cumberland Obelisk, Rhododendron Drive, and the Long Walk.

Afterwards the annual dinner was held in the White Hart Hotel, Mr. J. Methven, sen., Vice-President, in the chair, in the absence of Professor Balfour. The usual loyal and patriotic toasts were given. The Chairman, Mr. F. Simmonds, gave "The Health of the Royal Scotch Arboricultural Society," which was responded to by the Chairman. Mr. Malcolm Dunn gave "The English Arboricultural Society" in a kind and feeling way, which was responded to by Mr. Bernard Cowan and Mr. Jas. Watts, J.P. Mr. Miller, agent to the Marquis of Salisbury, made some interesting remarks as to the future of the land question. He advocated all land, where remote from railway stations, to be planted with trees, and he mentioned the better the land the better the results would be.

The next day everyone was astir in good time, as there were several objects of interest to be still seen in Windsor—St. George's Chapel, &c., in front of which the party was photographed. Carriages were then entered, and a quiet drive took us to Cliveden. On the fine terrace is a magnificent Magnolia. Tulip Trees and Lombardy Poplars here received attention, some were 105 feet high. A Yew vista, very effective and pretty, next drew attention. The glass houses are numerous, and under the able management of Mr. R. Nesbit are, of course, in good order. Dropmore, the seat of Lady Fortescue, was then visited, and this is noted for its fine collection of Coniferæ, which have often been mentioned in these pages.

The celebrated Burnham Beeches was then visited. Mr. H. J. Veitch, who joined the party at Cliveden, and proved a most instructive guide. The party was also joined here by Mr. Penney, late head gardener to the Prince of Wales. The Beeches were much admired, and the drive very pleasant through the woods. After a short drive the grounds of Mr. Harry Veitch were inspected. A halt was made at Stoke Pogis to visit the grave of Gray, who wrote his well-known elegy in a country churchyard. A drive to Windsor, and portmanteaus all quickly packed, we are soon into our special train, and arrived at Southampton the same day, to be ready the next day for the New Forest.

We were all up in time the following day to catch the 8.30 boat to Hythe, half hour drive brings to Beaulieu. There is the remains of a fine old monastery, the ruins of which was covered with Clematis Vital ba, and also Myrtus communis was in bloom here. From Beaulieu we had one and a half hour's drive to Lyndhurst, where the party was received by the Hon. Gerald Lascelles, the Deputy Surveyor in charge. A visit was also made to Marwood, the seat of Sir William Harcourt, M.P. Returning to London Kew Gardens and the Exhibition at Earl's Court were visited on Saturday. The party then dispersed, about fifty going home from Euston, the rest visiting Hatfield on Monday.—BERNARD COWAN F.R.H.S.

EPILOBIUM OBCORDATUM.

THE dwarf-growing Epilobiums, many of which are suitable for growing on rockeries, are not so well known in gardens as some of the taller species and varieties. Amongst the former E. obcordatum (fig. 27) may be mentioned, for although by no means a new plant, it is worthy of extended cultivation. It is a native of the Rocky Mountains, where it is found at over 1000 feet above sea level. It is perfectly hardy in our gardens, standing any amount of drought, and the present season has suited this plant admirably, flowering as it has done incessantly from June until the present time. Dry'sunny slopes are the places to be chosen on which to plant it. It soon covers the place allotted to it. The flowers vary from three to five on each stem, over an inch in diameter, and of a lovely dark rose colour. It is easily injured by damp during the winter season, and should be protected by a "cloche" or piece of glass raised above the plant, so as to allow free access of air. A difficulty is often experienced in propagating it, but in heat it roots readily at this season, when the cuttings have been thoroughly ripened.

HORTICULTURAL SHOWS.

TAUNTON DEANE.—AUGUST 10TH.

This flourishing Society held its twenty-sixth annual Exhibition at Vivary Park on the above date under most favourable auspices; the weather, that most important element in success or failure of horticultural exhibitions, having been all that could be wished for; indeed the Society has been most fortunate in this respect, for it is stated that of the twenty-six exhibitions only one of them was marred by a thoroughly wet day. At these exhibitions it has been my happiness to have officiated as judge for the last twenty-one years uninteruptedly, during which time I need not say great changes have taken place. Secretaries, committee, judges, and exhibitors have alike changed, and perhaps I was almost the only one present at the meeting who could look back to an official connection with the Society for so long, and now having attained my majority I think that it is most probable that my connection also with it will cease.

With regard to the Exhibition itself the same change has also taken place. The main features of it are indeed the same; two large tents of plants and flowers, the fruit and vegetables, the cottagers' productions (always most creditable here), are the same as heretofore. These were well filled, although there were some gaps owing to the earliness of the season, but on the whole it was remarkable what fine collections had been got together. The plan which has been adopted of late years of placing collections of large plants, which filled the middle of the tent on the ground instead of that on stages, is an excellent innovation. Formerly it was rather the pots than the plants which were seen, but now visitors can look down upon the plants and see them in their full

On entering the first tent we are confronted by the splendid collections of Mr. James Cypher of Cheltenham. In class 1, for twelve stove and greenhouse plants, were Statice profusa (this is one of the most splendid plants of this kind ever exhibited), Erica obata purpurea, Erica Aitoniana Turnbulli, Bougainvillea glabra, Allamanda nobilis, Allamanda Hendersoni, Dipladenia amabilis (very good), Ixora Pilgrimi,

Ixora Williamsi, and Anthurium Scherzerianum; this was a very fine specimen and well flowered. The same firm was first in class 2, for six stove and greenhouse plants, which consisted of the following:— Erica Irbyana, Erica Austiniana, Allamanda nobilis, Statice profusa, Ixora Pilgrimi, and Ixora Williamsi. For foliage plants Mr. Cypher was again first. He had grand specimens of Kentia Fosteriana, Kentia australis, Latania borbonica, Croton montefontainensis, Croton Thompsoni, Croton Chelsoni, Dasylirion acrotrichum, Cordyline indivisa; these plants were all vigorous, clean, and well grown. Mr. Cypher's collections were undoubtedly the cream of the Exhibition as far as plants were concerned, although some very excellent exhibits were staged by Mr. Brock of Exeter and Mr. Mould of Pewsey, Wilts; in fact, there was a smaller gap between the first and second collections than on many previous occasions, showing that the excellence of culture was

Considerable changes have taken place in the character of the plants exhibited under what may be termed greenhouse plants. I can look back on the time when one whole side of the tent was occupied with various classes of Pelargoniums—Zonal, Nosegay, gold and silver variegated, and bronze, while neither Begonias or herbaceous plants were to be seen. Now this is changed, and the two latter classes have come prominently forward, although one of the best exhibitors of Begonias, the Mayor of Taunton, was unable to put in an appearance, as his plants had nearly all gone out of flower. This was a great disappointment to many, as his collections were always well grown, and comprised the best novelties. At the entrance to the tent a stand of Begonias and other flowers, exhibited by Mr. Davis of Yeovil, whose strain of Begonias, both single and double, is so well known. I had made a list of these, but unfortunately have mislaid it. There were several stands of the ever-attractive herbaceous plants. These were shown in large bunches of flowers, the most conspicuous of which came from Mr. Pritchard, the well-known nurseryman at Christchurch, Hants. At this end of the tent was a fine stand of Messrs. Kelway & Son's seedling Gladioli,

for two of which first-class certificates were awarded. This firm had also other hardy flowers, making altogether a grand display. The cut flowers were exhibited on the other side of the tent, and consisted of Roses, Gladioli, Asters, Dahlias, Verbenas, Hollyhocks, and Begonias. Many of these showed unmistakeably the effects of the weather, Hollyhocks and Verbenas being especially poor.

I was surprised to see Roses so well shown as they were. Although few in number they were excellent in quality, being well exhibited by Messrs. Keynes, Williams & Co., and Mr. Budd of Bath. For thirty-six varieties the former obtained the first prize. The varieties were—Back row: Charles Lefebvre, Mrs. J. Laing, Capt. Christy, Comte Raimbaud, Hon. Edith Gifford, A. K. Williams, John Hopper, Sénateur Vaisse, The Bride, Xavier Olibo, Paul Neyron. In second row: La France, Etienne Levet, Climbing Niphetos, Lady Arthur Hill, Lady Mary Fitzwilliam, John S. Mill, Princess Vera, a very good Tea; Jean Soupert, very rich

FIG. 27.—EPILOBIUM OBCORDATUM.

and dark; Amazon, Charles Lamb, Perle des Jardins, Lady Sheffield. In the third row: Beauty of Waltham, Sunset, a good bloom; Grand Mogul, identical with Jean Soupert; Madame Hoste, a very beautiful bloom of a good Tea; Comtesse d'Oxford, Maréchal Niel, Souvenir de Madame Metral, Devoniensis, Ferdinand de Lesseps, May Rivers, a very pretty China Tea; Madame Cusin, Dupuy Jamain. Mr. S. P. Budd was a very good second. In the class for eighteen singles Messrs. Keynes, Williams & Co. were again first with the following varieties—La France, Madame Victor Verdier, Mrs. J. Laing, Marie Margot, Marquise de Castellane, Alfred Colomb, A. K. Williams, Edith Gifford, Countess of Rosebery, Perle des Jardins, Horace Vernet, Lady Mary Fitzwilliam, Princess of Wales, Duchess of Bedford, Comtesse de Nadaillac, very good in colour; Gustave Piganeau, Madame Hoste, and Charles Lefebvre. The same firm had some excellent stands of Dahlias in the various sections of show, fancy, Cactus, and single varieties. The Cactus Dahlias, especially, were fine; two were certificated, and one of these, Gloriosa, was of a brilliant colour, and promises to be an effective addition to this class.

The Mayor of Taunton's (Mr. W. H. Fowler) Gladioli were as usual of surpassing excellence, but it may serve as an illustration of the extraordinary character of the season, for whereas in 1892 he had a difficulty in obtaining the requisite number of varieties because his flowers were not in bloom, this year he had the same difficulty from another cause, viz., that nearly all his flowers were over. His stand of twenty-four comprised the following fine varieties: Grand Rouge,

Shakespeare, Grand Vainqueur (a splendid flower), Mont Blanc (a grand white), Baroness Burdett Coutts (very large and fine), Countess Craven, Giganteus, Protée (a very beautiful flower), Fantonine, Ali, Adolphe Brogniart, Medicis, Oriflamme (very bright), Dalilah, Caméleon, Mons.

Chevrueil, Le Vesuve.

The second tent was to a great extent a reproduction of the first, the main difference being that the nurscrymen do not compete, and consequently amateurs have a better scope for their exhibits. At the entrance of this tent Messrs. Robert Veitch & Son of Exeter had a stand of varied and beautiful flowers, conspicuous amongst which were two varieties of Lilium auratum—namely, plataphilaum and rubrovitatum; flowering and foliage plants from Mr. Brock of Exeter, and Miss Todd of Southampton, and Mr. Wilfred Marshall, whom I am glad to see resuming his place amongst exhibitors. Mr. Tottie's Fuchsias were, as usual, good. In Roses Dr. Budd occupied the leading position as far as H.P.'s were concerned, but that veteran florist, Mr. Hobbs of Lower Easton, Bristol, was a good second. For twelve Teas the Mayor of Taunton held the first place; his flowers were Edith Gifford, Madame de Watteville, Anna Olivier, Cleopatra, Princess of Wales, Comtesse de Nadaillac, fine in colour; Ernest Metz, Madame Cusin, Souvenir de Thérèse Levet, Marie Van Houtte, Sappho, and The Bride. Dr. Budd was second with fine flowers, but showing little variation of colour.

It must not be supposed that I have attempted to give anything like a detailed account of all the exhibits of this remarkable Show. but selected a few of the most salient points, with the object of conveying to your readers how thoroughly horticulture is patronised in the west. When I think of the feeble exhibitions which are held in my own county and in the neighbouring ones, and contrast them with the vigorous and sustained efforts which mark our western friends, I feel ashamed of our apathy. There is one thing, however, in which Taunton people have been most highly favoured, and that is in the character of the weather on their show days, as I have already said; but there is another element of their success which must not be omitted—namely, the excellence of all the arrangements. I know no Society which is happier in this respect. The courtesy of the Secretaries, and the energy with which the Committee carry out their duties, leave nothing to be desired. Judges and exhibitors may alike wish that for many years they may carry out the same courtesy and energy, duties which, however pleasant, are not light, but, at any rate, they have their reward in the gratitude of all concerned.—D., Deal.

[The vegetables and fruit were dealt with on page 157, last week.]

CARDIFF.—AUGUST 15TH AND 16TH.

THERE is every prospect of this Society becoming one of the most prominent in the south-western counties. Already it quite takes the lead in the Principality, and, thanks to the energy and untiring zeal of its Secretary, Mr. H. Gillett, and a good working Committee, such progress is being made as to quite render the Society worthy of such an

important town as Cardiff.

In the open classes Mr. J. Cypher was well to the front, taking first prizes with twelve stove and greenhouse plants in bloom, eight fine-foliaged plants, and four Orchids. In each instance Messrs. Heath and Son, Cheltenham, were a creditable second. Mr. Cypher's flowering plants consisted of Ixoras Pilgrimi and Williamsi, Phœnocoma prolifera Barnesi, Allamanda nobilis, Bougainvillea glabra, Statices Gilberti and profusa, Ericas Marnockiana, Austiniana, and Aitoniana Turnbulli, all fresh and good. The fine-foliaged plants consisted of Crotons Queen Victoria, Chelsoni, and Montfontanensis beautifully coloured; Kentia Belmoreana and Canterburyana, Cycas revoluta, and a Caryota. The Orchids were Dendrobium phalænopsis, with four spikes; Calanthe veratrifolia, Vanda cœrulea, and Cattleya Dowiana. The best six Fuchsias were shown by Mr. Hillard, a working shoemaker, and were fine pyramids of Mrs. Rundle, Beacon, Try Me, Oh! Marginata, Charming, and King. Mr. J. Clarke, gardener to Colonel Sir G. S. Hill, was second. For exotic Ferns Mr. J. Clarke was a good first, but was coloned some for six Yound Polargonians. was only second for six Zonal Pelargoniums, Mr. J. Hillard being again first with extra large well-flowered specimens. The Tuberous Begonias were remarkably fine, and with these Mr. J. Malpas, gardener to E. Jenkins, Esq., Penyland, was first. In the amateurs' tent Fuchsias again made a good display, Mr. J. Clarke being first with excellent pyramids of Mrs. F. Glass, Rose of Castille, Beacon, and Display. Mr. J. Hıllard was a creditable second. Mr. Clarke had the first prize for stove and greenhouse flowering plants, among these being Justicia carnea freely flowered and Clerodendron Balfourianum. For finefoliaged plants, Mr. Pettigrew, Cardiff Castle Gardens, was an easy first, staging fine healthy specimens of Kentia borbonica, Cycas revoluta, Phænix compacta, and Latania borbonica. Mr. J. Malpas, gardener to E. Jenkins, Esq., Penyland, was second; and Mr. J. Hockey, gardener to Colonel C. H. Page, third. Mr. Malpas was first for Caladiums, and Mr. J. Clarke second, while for Zonal Pelargoniums Mr. J. Clarke was first, Mr. J. Oxenham second, and Mr. H. Rex, gardener to C. Waldron, third. The best Tuberous Begonias were shown by Mr. J. Blackmore, gardener to A. Duncan, Esq., Mr. T. Malpas being second, and Mr. A. Whitefield, third. Mr. Pettigrew was awarded a first prize for a grand standard Ivy-leaf Pelargonium.

One tent was wholly devoted to groups, three classes being provided. The premier prize for a group to occupy a space occupying 100 square feet, was well won by Mr. W. J. Hockey, gardener to Colonel Page, Cardiff. This group was in the form of a circle, the centre consisting of a good Kentia raised rather high, and springing out of a bank of Fern,

Liliums, bright coloured Crotons, Celosias, and others. Just clear of this a circular mound was formed of Maidenhair Fern, out of which sprung numerous elegant Palms, Crotons, Dracænas, Begonias, and a few Gloxinias and other flowering plants. Mr. F. Case, Cardiff, was a fairly good second, and R. Phelps & Co., Cardiff, third. Three competed with half-circular groups, Mr. J. Clarke being a good first, and Mr. H. Rex second. With still smaller groups Mr. E. Lewis was a good first, and Mr. P. Lordon, cardoner to J. C. Maggett, Fog. third. Mr. R. Jordan, gardener to J. C. Meggett, Esq., third.

Cut flowers, in both the open and amateurs' tents, were remarkably good, and the competition very keen. Particularly good were the Roses. The best twelve triplets were shown by Mr. Crossling, Penarth, who had fine fresh blooms of Duke of Wellington, Duchess of Bedford, Mrs. J. Laing, Victor Verdier, La France, Marie Baumann, Lord Bacon, Fisher Holmes, Captain Christy, A. K. Williams, Victor Hugo, and Lady Mary Fitzwilliam. Dr. Budd, Bath, was a good second, his best being C. Lefebvre, A. Colomb, Horace Vernet, Duchess of Bedford, and La France. An extra prize was awarded to Messrs. Keynes, Williams, and Co. Selisbury. The Teas were even better than the Hybrid Person and Co., Salisbury. The Teas were even better than the Hybrid Perpetuals. With twelve triplets of these Mr. J. Treseder, Cardiff, was first, having fine fresh blooms of Comtesse de Nadaillac, The Bride, Ernest Metz, Marie Van Houtte, C. Mermet, Madame Bravy, Hon. Edith Gifford, Ethel Brownlow, Perle des Jardins, Princess Beatrice, and Francisca Kruger. Dr. Budd was second, and an extra prize went to Messrs. Keynes, Williams, & Co. The best twenty-four single blooms, any varieties, were shown by Messrs. Keynes, Williams, & Co., Dr. Budd being second. The class for twelve Teas was a grand one. Mr. S. Treseder was first. The second prize was awarded to Dr. Budd, and Mr. R. Crossling received an extra prize. Mr. G. Humphries, Chippenham, succeeded in winning the first prize for twenty-four Dahlias, among these being very fine blooms of G. Barnes, J. Walker, Crimson Ring, R. S. Rawlings, Colonist, Mrs. Gladstone, Mrs. Saunders, Queen of the Belgians, and Mr. Glasscock. Messrs. Keynes, Williams, & Co. were second. The last named took the lead with twelve bunches of Cactus Dahlias, making a very effective display with Bertha Mawley, Delicata, Apollo, Kaiserin, Countess of Radnor, and Countess of Gosford. In Mr. Humphries' second prize stand were good blooms of Alpha, the best white Cactus flowering Dahlia yet raised. Mr. Garraway, Bath, was first, and Mr. Every, Bath, second, with Asters; and Mr. G. Blackmore, gardener to A. Duncan, Esq., was first with Begonia blooms. Gladioli were not particularly good. Mr. J. Tant was first, and Mr. G. Shewring second for twenty-four varieties. Herbaceous flowers were grandly shown. Mr. G. Garraway was first for these, and Mr. G. Shewring second. Asters were shown remarkably well by Mr. J. Lloyd, gardener to Vincent Stuckey, Esq., Langport, Mr. G. Garraway being a good second.

Wreaths, crosses, and bouquets are always grandly shown at Cardiff, but the exhibitors of the best examples on this occasion did not always meet with their desserts. Mr. W. Treseder was placed first, and Mr. F. Case second for a wreath, both having magnificent exhibits, such flowers as Lilium lancifolium album, Gladiolus The Bride, Francoa ramosa, Roses, Stephanotis, Arums, and Tuberoses being very freely used. For a cross, R. Phelps & Co., Cardiff, were first, but that shown by Mr. F. Case should have been preferred, instead of being placed second. Mr. W. Treseder had a first for a grand bridal bouquet, Mr. F. Case being a close second, while for a coloured bouquet Messrs. Phelps & Co. were first, and Mr. R. Treseder second. The dining tables were not of great merit.

It is in the fruit department where the greatest strides have been made, the exhibits being more numerous, and the quality generally of marked improvement. Eight competed, with six bunches of Grapes in six varieties, and curiously enough the Judges were not equal to deciding which exhibit deserved the first prize. Mr. Dawes, gardener to Mrs. ing which exhibit deserved the first prize. Mr. Dawes, gardener to Mrs. Biddulph, Ledbury, and Mr. E. Silk, gardener to F. M. Franklin, Esq., were placed equal first, the former having good Alnwick Seedling, Black Hamburgh, and Muscat of Alexandria, and the latter fine but not well coloured Gros Maroc, poor Muscat of Alexandria, and good Black Hamburgh. Mr. J. Lloyd was placed third for some fine bunches. With Black Hamburgh Mr. Silk was first, having extra fine and well coloured bunches; the second prize to Mr. J. Greatrex, gardener to Miss Rous, who also had fine bunches. For Muscats Mr. Dawes was first, and Mr. Lloyd second. Mr. Silk staged fine Foster's Seedling, and was first, the second prize going to Mr. Lloyd. Mr. Silk was also first for any other white, having fairly good Golden Queen; Mr. F. Crossman, gardener to Captain Dick, being second with Buckland Sweetwater. Alicantes were shown in fine condition by Mr. Dawes, Mr. S. Bowditch, gardener to Colonel Gaskell, being a good second. There were also Melons were quite a feature in the several single bunch classes. display, and with these Mr. A. Pettigrew was most successful, taking first for single fruit, and for pairs in three different classes, Messrs. E. Lewis, J. Dawes, J. Portsmouth, gardener to H. W. Well, Esq., being the other prizewinners. A dish of very pale Alexandra Noblesse Peach gained Mr. J. Oswald, gardener to W. T. Crawshay, Esq., a first prize, Mr. H. Morgan being second. In the class for Nectarines Mr. F. Case was first with Pineapple, a handsome dish of Lord Napier shown by Mr. Dawes being placed second:

Apples were grandly shown. For four dessert varieties the Fruit and Flower Company, Hereford, were first, having Lady Sudelcy, Duchess of Worcester, Worcester Pearmain, Yellow Ingestre, Astrachan, and Evagil. Mr. J. Lloyd was a very close second. The Fruit and Flower Company were also first for culinary Apples, the varieties being Peasgood's Nonesuch, Lord Suffield, Frogmore Prolific, Lord Grosvenor, Cellini, and Potts' Seedling. Mr. W. J. Hockey was second. The prizes offered for a collection of six dishes of fruit are scarcely worthy of the Society, and the wording of the schedule was decidedly faulty. Mr. J. Dawes was first with good Gros Maroc and Muscat of Alexandria Grapes, Eastnor Castle Melon, very fine Barrington Peaches, Humboldt Nectarines, and Jefferson Plums. Mr. J. Lloyd was second, losing principally owing to having one variety of Grape only, his construing of the schedule being the right one.

Another tent was wholly filled with vegetables. The best collection of nine varieties was shown by Mr. G. Shewring, Mr. A. Baxter being a good second. The first of Messrs. Webb's prizes was won by Mr. Every, Mr. Garraway being a close second. Mr. J. Portsmouth was the winner of Messrs. Sutton & Son's first prize, the second going to Mr. W. J. Hockey. The principal prizewinners in the numerous other classes were Messrs. Baxter, Greatrex, Shewring, Porter, J. Richards, W. Hillier, and W. Moore.

In the non-competitive classes Messrs. B. S. Williams & Son arranged a very attractive group of Orchids, Sarracenias, Palms, and other choice plants, for which they were very highly commended. One side of a tent was wholly occupied with a group of hardy and heat-loving Ferns brought from Sale, Manchester, by Messrs. Birkenhead, and near to these was a grand display of Gladioli, Gaillardias, and such like by Messrs. Kelway & Sons, Langport. Messrs. Edwards & Son, Notting-ham, exhibited a large number of fancy pots and baskets filled with Ferns, and the display of a somewhat similar character being made by Messrs. Heath & Son, Cheltenham. Messrs. T. H. Crasp & Co., nurserymen, &c., Swansea, had several hand bouquets, wreaths, and crosses on view, and the local nurserymen lent a considerable number of plants for filling up blank spaces.

WILTS .- AUGUST 16TH.

FAVOURED by charming weather the Wilts Horticultural Society held the annual Exhibition of plants, cut flowers, fruit, and vegetables, in the Earl of Pembroke's beautiful park at Witton, near Salisbury, on the 16th inst.

In the open classes three good exhibits of twelve stove and green-In the open classes three good exhibits of twelve stove and green-house plants, six foliage and six flowering, were staged by Mr. Finch, gardener to J. Marriott, Esq., Queen's Road, Coventry; Mr. Willes, Winchester Road, Shirley; and Mr. Peel, gardener to Miss Todd, Lidford Lodge, Southampton, and the prizes were awarded to them in the order in which their names appear. The first prize dozen consisted of well flowered plants of Ixora Fraseri, Clerodendron Balfouriana, Dipladenia Thomas Speed, Erica Irbyana (about 6 feet over), E. Marnockiana, Phœnocoma prolifera Barnesi, Kentia Fosteriana, K. australis, Cycas circinalis, Latania borbonica, Croton Queen Victoria, and C. Morti, the Crotons being well coloured. In the class for nine stove and greenhouse plants, four in bloom and five foliage, there were and greenhouse plants, four in bloom and five foliage, there were three entries. Mr. T. Wilkins, gardener to Lady Theodore Guest, Inwood House, Henstridge, was first; Mr. Peel second, and Mr. Willes was third, all staging good plants. Mr. Wilkins had the best half dozen of exotic Ferns, showing fine healthy looking plants of Cyathea dozen of exotic Ferns, showing fine healthy looking plants of Cyathea medullaris, Davallia Mooreana, Adiantum Farleyense (a grand plant), Thamnopteris nidus avis, Adiantum cuneatum, and Gymnogramma Wettenhalliana. Mr. Peel was a creditable second. Mr. A. Bedford, Harnham Nursery, Salisbury, was first for pyramidal Fuchsias, Mr. George Fulford, gardener to Earl Nelson, Trafalgar Park, Salisbury, being awarded the third prize for smaller but well flowered plants. There were only two entries. Mr. A. Robey, gardener to Captain Greenwood, Harnham Cliff, Salisbury, was first in the class for six Tuberous Begonias; Mr. E. Willes was second, and Mr. Thomas Wilkins third third.

Groups of plants arranged for effect formed a feature. Mr. Willes was first for a light and well finished arrangement, "dot plants" of brightly coloured Crotons, Celosias, Ixoras, Bridal Wreath (Francoa ramosa), Tuberoses, Asparagus, small Palms set in a groundwork of Maidenhair Fern (Adiantum cuneatum), with a Palm at the back, which gave a dignified effect to the group. Mr. Wilkins was second with a similar group. Mr. Robey was third. There were five entries in this class. The group confined to gentlemen's gardeners only brought out two contestants for the honours offered, Messrs. Wilkins and Peel, who with good arrangements took the prizes in that

The silver cap, value £5, open to amateurs within a radius of six miles of Salisbury, given by the Right Worshipful the Mayor of Salisbury (A. Whitehead, Esq.), for a group of plants arranged in a semicircle of 10 feet in diameter, only brought forth two entries. Mr. Frank Pearce, High Street, Salisbury, and Mr. Alderman Lovibond, St. Anne Street, also of Salisbury, who took the prizes in that order with tastefully set up arrangements. Mr. Hinxman, gardener to H. C. Gregory, Esq., The Island, Fisherton, Salisbury, led in the class for a group arranged in a semicircle. 8 feet in diameter, being class for a group arranged in a semicircle, 8 feet in diameter, being closely followed by Mr. Ford, gardener to M. Swayne Esq., The Island, Witton, and Mr. C. Hamlin, The Close, Salisbury, all for creditable arrangements. Mr. J. Chalk, gardener to Mrs. Rigden, Relle Vye Salisbury had the best six Ferry distinct: Wr. G. Hibbert. Belle Vue, Salisbury, had the best six Ferns, distinct; Mr. G. Hibbert, gardener to Miss Nightingale, Witton, was second; and Mr. Alderman Lovibond third. The last named exhibitor had the best half dozen plants of Coleus, and Mr. J. Rockett, gardener to George Smith, Esq., Westbourne, Salisbury, was second, both showing well. Mr. A. Robey was first for six Tuberous-rooted Begonias; Mr. J. Hughes, gardener to W. Baring, Esq., Norman Court, Salisbury, was second, and Mr. J. Scammel, gardener to J. R. Kendle, Esq., Witton, third.

Mr. Hinxman was first for three pots of Liliums, and Mr. C. Hamlin

Fruit was shown remarkably well. Eight collections of eight kinds (Pine Apple excluded) were staged, Mr. H. W. Ward, gardener to the Earl of Radnor, Longford Castle, Salisbury, being well ahead with large solid bunches of Muscat of Alexandria, large in berry and well coloured; heavy bunches of Black Hamburgh, fine in berry and finish, and carrying a good bloom; fine Blenheim Orange Melon, large Sea Eagle Peaches, fine Brunswick Figs, white Magnum Bonum Plums, large, clean, and beautifully coloured Bon Chrêtien Pears, and Pineapple Nectarines, the latter being the only weak dish in the collection. Mr. A. Crossman, gardener to J. Brutton, Esq., Yeovil, was a good second. Mr. Charles Warden, gardener to Sir F. H. Bathurst, Bart., Clarendon Park, Salisbury, being a close third. Mr. H. W. Ward was also first for three bunches of Muscats; Mr. J. Fewtrell, gardener to Charles C. Tudway, Esq., The Cedars, Wells, Somerset, being sec nd; and Mr. J. Budd, gardener to F. J. Dalgetty, Esq., Lockerley Hall, R maey, third. In the class for any other white Grape than Muscat of Alexandria, Mr. Ward was first with handsome bunches of Golden Queen, Mr. Warden being second with heavy bunches of Buckland Sweetwater, and Mr. P. R. Dav.dson, gardener to Lord Wolverton, Iwarne House, Shafterbury, was third with the same variety. There were seven entries in this class. Mr. James Chalk, gardener to George Read, Esq., Westwood, Salisbury, was first for Black Hamburghs, showing three good-sized bunches. Mr. Warden and Mr. Ward were second and third respectively with smaller but better coloured bunches. In the "any other" black class Mr. Warden was first in a good competition, staging fine shapely bunches of Muscat Hamburgh, fine in berry and well coloured. Mr. Davidson was second with Black Alicante, somewhat loose in the bunch, and Mr. Hughes was third with same variety. Mr. Crossman was first for Pine Apple, showing a medium-sized Queen, large in the pips, and highly coloured. Mr. Budd was second, a larger Queen, a little green about the pips, and a good-sized Cayenne being passed by the Judges. Out of fourteen Melons staged Mr. Palmer, Conden "Villa," Andover, was first for a variety named "County Councillor," Mr. Hughes being second, showing a nice fruit of Hero of Lockinge.

Apples and Pears were well shown. Mr. Frederick Smith, gardener to the Bishop of Salisbury. The Palace Salisbury was as is usual at

to the Bishop of Salisbury, The Palace, Salisbury, was, as is usual at this Show, first for three dishes of dessert Apples, staging even, clean, well coloured fruits of Worcester Pearmain, Mabbott's Pearmain, and Céline. Mr. Evans, gardener to Lady Ashburton, Melchet Court, Romsey, was second; and Mr. Hughes third. Mr. Wilkins had premier honours in the corresponding class for culinary varieties, showing fine fruits of Blenheim Orange, Lord Suffield, and Peasgood's Nonesuch. Mr. Evans was second; and Mr. Inglefield, gardener to Nonesuch. Sir John Kelk, Bart., Tedworth House, Marlborough, was third. Mr. Hughes was first for four dishes of Pears, being closely followed by Mr. F. Smith and Mr. Browning, gardener to Canon Sir Talbot Baker, Ranstone, Blandford. Mr. Wilkins was first for Peaches with six even highly colouted fruits of Sea Eagle, Mr. Hughes being second with Barrington. Mr. Chalk was first for Nectarines with good fruits of Barrington. Pineapple.

Three collections of twelve kinds of vegetables were shown by Messrs. Wilkins, Inglefield, and Mr. A. J. Allsop, gardener to Viscount Portman, Brynstone House, Blandford, by whom the prizes were taken in the order indicated. Mr. Wilkins' collection contained fine examples of Autumn Giant Cauliflower, Sutton's Perfection Tomato, Favourite Onions of immense size, fine shape, and very firm; Satisfaction Potato, Stratagem Peas, New Intermediate Carrot, Exhibition Beet, Lyon Leek, Ne Place Ultra Rupper Bean, Model Cucumber, and Giant, White Celery,

Stratagem Peas, New Intermediate Carrot, Exhibition Beet, Lyon Leek, Ne Plus Ultra Runner Bean, Model Cucumber, and Giant White Celery, the whole being very tastefully set up with green Parsley.

The cut flower classes were well filled, and Dr. D. Seaton, Rutland Lodge, Bitterne, Hants (gardener, Mr. Pomroy), was well first for twenty-four Roses, single trusses. Mr. Evans was first for twelve Roses, distinct, with good blooms. Mr. Budd was a good first in the class for eighteen bunches cut flowers. Dahlias were shown well by Mr. West and Mr. C. Hooper, and Asters by Mr. Browning.

Messrs. Keynes, Williams, & Co. contributed an artistic arrangement of cut flowers and plants, also eight stands of Show, Fancy, and Cactus Dahlias. Messrs. Robert Veitch & Son, Exeter, had a fine and rare assortment of herbaceous and alpine plants in great variety, also a good assortment of Apples, the fruits being of fine size, clean, even, and

assortment of Apples, the fruits being of fine size, clean, even, and many of them being very highly coloured. Mr. Ladhams, Shirley, also greatly helped in rendering the flower tents both interesting and attractive by a liberal contribution of herbaceous and alpine flowers, which served to illustrate the utility and attractiveness of these, in many places, neglected hardy plants.

EARL'S COURT,—AUGUST 23RD AND 24TH.

A SPECIAL Show of Gladioli, Dahlias, with other flowers and fruit was held at the Gardening and Forestry Exhibition, Earl's Court, on the above dates. The tent in which the Show was held was fairly well filled, and most of the exhibits, considering the season, were of good quality. Gladioli and Dahlias were fairly represented, but comparatively few Asters were forthcoming. Miscellaneous floral exhibits made a good display, as also did fruit. Rain fell heavily on the opening day, Miscellaneous floral exhibits made a and the Show was not numerously attended.

The principal class provided was for 100 spikes of Gladioli, but here only one firm competed. This was Messrs. J. Burrell & Co., Howe House Nurseries, Cambridge, to whom the first prize was awarded. The spikes shown by Messrs. Burrell were grand, being large in size and brilliant and varied in colouring. Space will not permit us to give the whole of

the varieties shown, but the names of a few of the most striking may These included Grand Rouge, Baroness Burdett Coutts, be interesting. These included Grand Rouge, Baroness Burdett Coutts, Cygnet, Atlas, Flambeau, Florence, Iolanthe, Corinne, Muriel, Fiamette, Castilda, and Tessa. First-class certificates were awarded for the last four varieties. In the class for twelve varieties Mr. D. Witlaw, Brechin, Scotland, was the only exhibitor, and the first prize was awarded for a collection of fine spikes. The best of these were Enchantress, Dr. Bailley, Grand Rouge, Opale, Sultane, Pyramid, Tiger, and Baroness Burdett Coutts. Messrs. Kelway & Sons, Langport, were awarded a silver-gilt medal for a fine collection of Gladioli, comprising seventy-two spikes of the leading kinds, also nine new varieties. Among the latter were Boston, Kate Marsden, Palene, Admiral Marden, Mariana, Among the latter and Indiana, the last-named a very deep coloured variety. A first-class certificate was awarded for a charming variety named Sir Michael Culme Seymour. Messrs. Kelway & Sons also had some boxes of Asters, Gaillardias, and miscellaneous hardy flowers.

Dahlias were shown in good condition, although not so extensively as might have been expected. There were five exhibitors in the class for twenty-four Show and Fancy Dahlias, and the competition was very keen. Mrs. S. Mortimer, Rowledge, Farnham, succeeded in winning the first prize with a stand of fine. clean, and even blooms. The best of keen. Mrs. S. Mortimer, Kowledge, Farnham, succeeded in winning the first prize with a stand of fine, clean, and even blooms. The best of these included Mrs. Saunders, Reliance, Mrs. George Rawlings, Maud Fellows, Henry Walton, Eclipse, Duke of Fife, Diadem, Sunbeam, and Harrison Weir. Mr. C. Turner, Royal Nurseries, Slough, was a close second with even flowers, Colonist, W. Keith, Miss Cannell, Hope, and Crimson King being particularly fine. Mr. M. V. Seale, Vine Nurseries, Sevenoaks, was third with smaller flowers.

In the class for twelve Show and Fancy Dahlias there were also five exhibitors, and Mr. T. Vagg, gardener to J. Theobald, Esq., M.P., Bedfords, Havering, Romford, won the leading prize. The finest flowers in this stand were Prince of Denmark, John Walker, Mrs. Gladstone, and William Rawlings. Mr. A. Ocock, gardener to Mrs. McIntosh, Havering Park, Romford, was second, and Mr. J. G. Fowler, Glebelands, South Woodford, third.

The single Dahlias were exceedingly good, and it is a pity that there were not more exhibitors. Messrs. J. Cheal & Sons, The Nurseries, Crawley, secured the first prize for twenty-four bunches, showing the principal varieties. Amongst others Victoria, The Bride, Lowfield Beauty, Eclipse, Alba Perfecta, and Formosa were very good. Mr. M. V. Seale followed with an attractive stand, the third award going to Mr. E. F. Such, The Nurseries, Maidenhead. Mr. Seale was first, however, for twenty-four bunches of Pompon varieties, the best of which were Red Indian, Whisper, Favourite, and Dorothy. Mr. C. Turner was second, and Messrs. J. Cheal & Sons third. The last-named firm was, however, first for nine bunches of Cactus and decorative Dahlias. The most attractive of these were Duchess of York, Delicata, Charming Bride, and Bertha Mawley. the second prize, and Mr. C. Turner followed closely. Mr. Seale gained

Miscellaneous floral exhibits were more numerous than those in the competitive classes. Messrs. J. Cheal & Sons sent a collection of Cactus, decorative, and Pompon Dahlias, tastefully arranged in bunches (silver medal). Mr. S. Mortimer had a large number of Show and Fancy Dahlias, the blooms being clean and brightly coloured. A similar collection came from Mr. E. F. Such, who also had some summer flowering Chrysanthemums (silver medal). Mr. W. Salmon, 2, Ivy Cottages, Elder Road, West Norwood, sent hardy flowers, arranged in bunches, and a collection of Dahlias (silver medal). Messrs. P. Barrand Sons Long Ditton, had a collection of Liliums and other hardy and Sons, Long Ditton, had a collection of Liliums and other hardy flowers, for which a silver medal was awarded. Messrs. W. Paul and Son, Waltham Cross, sent a splendid collection of fruit trees in pots, including Apples, Peaches, Plums, Pears, and Figs. The trees were remarkably healthy and loaded with fruit. The same firm also had boxes of cut Roses, dishes of Apples and Pears. This contribution attracted considerable attention by reason of its diversity and excellence, and merited the gold medal awarded. Mr. W. Welsford, South Lambeth, sent a group of annuals in pots, and a collection of hardy flowers. Mr. J. Hudson, gardener to Messrs de Rothschild, Gunnersbury House, Acton, contributed a group of specimen scentedleaved Pelargoniums, some of which were 4 feet in height and as much in diameter. Mr. J. Walborn, Cedars Nursery, West Kensington, had a small group of plants, comprising Palms, Liliums, and Crotons (silver medal). Mr. G. Wythes, gardener to the Duke of Northumberland, also staged Crotons and some well-grown Nepenthes (silver-gilt medal). Mr. A. W. Young, South Norwood, had some Gloxinia and Begonia blooms. Fruit formed a feature in the Show, although only one competitive

class was provided. This was for twelve dishes of hardy fruits, and there were four exhibitors. Mr. McIndoe, Hutton Hall Gardens, Guisborough, secured the first prize for a grand collection, comprising Pitmaston Duchess and Souvenir du Congrès Pears, Crawford's Early and Violette Hâtive Peaches, Elruge and Byron Nectarines, Columba and Jefferson's Plums, Swedish Reinette and Cox's Pomona Apples, Morello Cherries, and Apricots. Mr. G. Wythes was second, this exhibitor showing a good dish of Mulberries in this collection. The third prize went to Mr. G. H. Sage, Ham House, Richmond. Mr. J. F. Hoar, gardener to J. T. Cooper, Esq., The Grange, West Molesey, sent a collection of Plums, Cherries, Pears, Peaches, and other fruit. Messrs. S. Spooner & Son, Hounslow, had a splendid collection of Apples of bright and clean appearance (silver medal). Mr. W. G. Richerd, gardener bright and clean appearance (silver medal). Mr. W. G. Richerd, gardener to F. Lilley, Esq., "Croft," Mount Park, Ealing, sent a number of dishes of fruit, including ten varieties of Peaches (silver medal). Mr. T. J. Stacey, The Peacheries, Caversham, Reading, had a very large collection of Melons, for which a silver medal was awarded.

FRUIT FORCING.

Pines.—Potting Rooted Suckers.—When the suckers obtained from the summer fruiting plants are ready for repotting, it is well to divide the plants into two batches. The strongest should be put in 10 or 11-inch pots as soon as they are well rooted, affording them a position near the glass in a light airy house. The plants so treated will produce a good successional supply of ripe fruit in late summer or early autumn next year. The other plants, suckers from the summer fruiters, winter best in 7 or 8-inch pots, transferring them to larger ones in the spring, which with suckers of Smooth-leaved Cayenne that were started last March will provide a successional supply of Pines through the winter

Re-arranging the Plants.—Those plants not fruiting will have completed their growths, and should have air liberally for the next six weeks when the temperature exceeds 80°. All well rooted plants require a bottom heat of 80° to 85°, but recently potted suckers, or those not having roots well established in the fresh compost, should have

the bottom heat maintained at 90°.

Fruiting Plants.—Moderate atmospheric moisture will be necessary for those swelling their fruit, admitting a little air early in the morning, so as to allow of any superfluous moisture escaping before the sun's rays act powerfully or directly upon the fruit. Any fruit it is desired to retard should be moved to a rather cool or shady house, affording an abundance of air.

Figs.—Earliest Trees in Pots.—These may be placed outdoors if the wood be ripe, but if there is any doubt about this the trees must be continued under glass with a free circulation of air. These are matters in which the cultivator must exercise judgment. In either case encourage surface roots by a top-dressing of rough loam and manure, with a sprinkling of superphosphate occasionally. Those placed outdoors must not be allowed to root from the base of the pots. Cut off all such roots, top-dress, after which afford a good watering, and they will need no more water at the roots than is sufficient to keep the foliage in health.

Earliest Fig Houses.—In the house started at the new year and with the trees planted out the wood will now be ripening, and the supply of water may be diminished or discontinued, air being given very liberally. If, however, the second crop is not yet ripened moderate moisture in the soil will be necessary, with a rather free circulation of warm air to insure high quality in the fruit. When the fruit is gathered take prompt measures to destroy insects, syringing forcibly to dislodge red spider, and remove brown scale with a brush and solution of softsoap, 3 ozs. to

a gallon of water.

Late Houses.—The fruit of trees in cool houses is earlier and finer this year than usual, and the second-crop Figs are so forward as to be likely to ripen. If any are left with this object it should be at the base of the current growth, removing those from the extremities of the shoots. The great point is to keep the growths thin and the roots restricted, so as to insure sturdy, short-jointed, well-ripened wood. Keep up a circulation of air, expose the fruit as much as possible to the sun, and if red spider be troublesome syringe on a fine morning after a close picking of the fruit, and give no more water than is absolutely needful for the well

being of the plants.

Unsatisfactory Trees.—Planted-out Fig trees not unfrequently grow rampantly, and in consequence produce thin crops of fruit. In that case root-pruning should be resorted to, and the roots confined to a narrow border of from 3 to 4 feet width. A trench taken out at this narrow border of from 3 to 4 feet width. distance from the stem after the fruit is gathered will check the tendency to a late growth, assist in the ripening of the wood, more especially if the growths are disposed thinly, and the points of the shoots, instead of being closely tied-in, are allowed to grow up to the glass. If the drainage be defective it will be necessary to lift the trees as soon as the leaves commence falling, and replant in fresh soil. Place 9 to 12 inches of rough rubble for drainage, and on this about 3 inches thickness of old mortar rubbish freed from pieces of wood. This will keep the drainage clear indefinitely, and the roots will find the lime that is required. Good turfy calcareous loam, rather strong than light, will grow excellent Figs. If deficient in lime add a sixth of old mortar rubbish to the loam, and in replanting ram the compost, thoroughly incorporated, well about the roots, for short-jointed wood cannot so well be secured by any other means than a solidified compost. The border must be 24 inches deep. Should the drainage he good it will only be recovered to the contract of th deep. Should the drainage be good it will only be necessary to confine the roots to the narrow border, removing some of the old soil from amongst the roots, and supply fresh compost.

Melons in Houses.—Maintain a night temperature of 65° to 70°, and 75° artificially by day. As the weather is exceptionally favourable there will be little need for fire heat, and the supplies of water will require to be liberal. As the days shorten lessened supplies will be needed, yet give enough water to keep the soil in a moist state whilst the fruit is swelling, but after it is full sized or ceases swelling afford no more than to prevent the foliage flagging. Keep the laterals well stopped to one joint or leaf, and rub off all superfluous shoots as they show, allowing nothing to interfere with the principal leaves, or to retard the swelling of the fruit. Plants with fruit advanced for ripcning should have an abundance of air, with, if practicable, an increase of temperature, avoiding a close moist atmosphere, and keep rather dry at the roots.

Latest Plants.—Those planted in houses will require every encouragement, maintaining a moist atmosphere and a temperature of 70° to 75° by artificial means, falling 5° on cold nights, and keeping the bottom heat steady at 80° to 85°. The leader must not be pinched until it reaches the trellis, when it may have its point taken out if more than one leader is wanted. Keep a sharp look out for canker at the collar and upon the stem, rubbing quicklime into the parts affected, striving to

maintain a clean growth. Melons in Pits and Frames.—The latest plants in pits and frames will have set or be setting their fruit. In order to secure a good set, the growths require to be kept rather thin, the atmosphere warm and dry by the aid of linings, so as to insure steady progress and the free admission of air. Those in hot-water-heated pits will be the better of a gentle warmth in the pipes on cold nights and dull wet days, a gentle heat affording facilities for ventilation, which should be given, if only a little, so as to insure evaporation, and the consequent elaboration and assimilation of the sap, on which depends in a great measure the quality of the fruits. The plants may be sprinkled, avoiding the collar or stem, early in the afternoon, and closing before or by the temperature has receded to 80° or 85°, and so as to raise it to 90° or 95°. Admit a little air at 75°, or increase it from that with the advancing sun heat to 85° or 90°, at which keep through the day from sun heat. Plants in frames should be attended to as required with linings of sweetened fermenting material as the nights become cold, so as to prevent the temperature falling below 65° in the morning, and if mats are placed over the lights after the sun leaves the frames, and removed shortly after the sun has risen, success will be ensured.

THE KITCHEN GARDEN.

Cabbages.—Hot weather and warm moist soil having caused the seeds to germinate quickly and the plants to grow rapidly, there is every likelihood of the earliest raised plants being much earlier than desirable. Anyway they ought not to be wholly depended upon. If more seed is sown at once thinly in drills previously moistened, there is every probability of the plants obtained being quite large enough to put out this autumn. Even if they are not they may yet prove very handy next spring either for forming successional beds or for filling blanks caused by many of the too early raised plants running to seed prematurely. Coleworts have also grown very rapidly, and no time should be lost in planting these extensively. They could be planted in succession to Peas, Beans, and autumn Onions without any preparation of the ground other than surface hoeing and removal of weeds. Should the weather be hot and dry this ought not to hinder planting, as rather than spoil the plants in the seed beds they ought to be well soaked with water prior to drawing, and be replanted in drills, also watered. A foot apart each way is enough space for small quick hearting Cabbages and Coleworts.

Onions.—In some gardens there are particularly good beds of Onions to be seen and in others very poor ones indeed. Where the seed was sown early and came up well the bulbs are all of good size and well matured, thick or "bull" necks being scarce. There is scarcely any necessity to twist down the tops in order to hasten maturation of the bulbous roots, and the latter will be fit for drawing and storing very much earlier than usual. Directly they come away readily from the soil is the time for removing them, and if they are further harvested on dry boards or wattled hurdles in the open, or if the weather is wet, an empty vinery or other dry airy place should be utilised. Onions after they are thus well prepared should be stored in a cool airy shed. Where the seed germinated irregularly, some not starting till several weeks later than the rest, the crops will be difficult to deal with. The late plants are bulbing badly and will not mature properly. It will be quite useless to draw these with a view to storing them, and the better plan will be to leave them where they now are, drawing them as they are wanted for use. Those that have made fairly good progress should have their necks or tops twisted down to hasten maturation, while all that are already ripening ought to be taken the greatest care of, being treated as already advised in the case of early beds, as it is these that will keep the longest.

sowing Onion Seed.—It is not yet too late to sow seed of Tripoli and White Spanish Onions to stand through the winter. Such are not absolutely indispensable, but are recommended if large heavy roots are desired early next summer, and ought certainly to be grown extensively where the summer crops are partial failures this season. The Queen, Early White Naples, and other early maturing varieties may well be sown with Giant Madeira, Giant White Tripoli, Roccas, and other large bulbing sorts, the drills being drawn 12 inches apart, and moistened prior to sowing the seed. The White Spanish types are quite as hardy as the Tripolis, but the bulbs obtained from plants raised very early in the year under glass are invariably of better form than those formed by autumn-raised plants, also keeping better.

Winter Spinach.—Judging from the progress made by a number of late planted winter green vegetables, Spinach will grow rather rapidly, and should the hot weather last through August the earliest plants of the latter will very probably run to seed prematurely. It is advisable, therefore, to sow another good breadth of ground at once. An open, rather high, or well drained and fairly rich piece of ground should be selected, and the seed be sown in shallow drills drawn not less than 12 inches asunder and well moistened.

Lettuces.—Where Lettuce can be obtained good early in the season is the best site for growing late autumn Lettuce. The Cos varieties sown late may fail to heart properly, and the preference ought therefore to be given to Early Paris Market, Golden Queen, Commodore Nutt, and All the Year Round Cabbage Lettuces. Draw drills 10 inches apart, give a gentle watering, and sow the seed rather thinly. During showery weather the thinnings drawn from rows of Cos as well as Cabbage varieties may well be dibbled out on warm borders, and should the weather keep fairly mild during September some useful Lettuces may be had for storing in frames or protecting with boards and frame lights.

be had for storing in frames or protecting with boards and frame lights.

Tomatoes in the Open.—This promises to be a remarkably good season for Tomatoes grown against garden walls and fences, as well as those in the open. Already a considerable weight of fruit has been cut, and there are large numbers of ripening and green fruit on the plants. All leading growths ought ere this to have been topped, while superfluous side shoots should be kept constantly cut away. Leaves are very strong and healthy, no disease being apparent. In order to favour the development of the later fruit, and to hasten ripening generally, the leaves should be freely reduced in size, in many instances not more than one-third of the leaf being left. As yet no disease has been observed, but it may become troublesome directly there is a change to dull showery weather. The best preventive is keeping the leaves dry. In many instances spare garden lights might with advantage be fixed over the plants against walls, these effectually warding off rains and heavy dews

Tomatoes under Glass.—These also have cropped admirably, the plants where they have not been stopped continuing to set great clusters of fruit. Where they have grown rather vigorously, and perhaps failed to fruit well in consequence, the plan of freely shortening back the leaves would have checked this over-luxuriance, and have promoted a more productive habit of growth. Many of the older leaves will now be quite yellow, and should be cut off. If disease spots show on the leaves, the worst form known as Cladisporium being denoted by yellow spots near the size of a threepenny piece, and a mildew-like patch underneath, can only be safely checked by means of a considerable increase of fire heat, accompanied by a good circulation of dry air. Raising the temperature of the house or houses to about 115° during the hottest part of three or four days in succession kills much of the fungus, as is both a safe and good remedy. Old plants in boxes or narrow ridges of soil can be kept in a growing productive state till next summer if need be. All that is necessary is to reserve and lay in side shoots thinly all over the roof, these soon commencing to bear fruit. In order to infuse a little new life into these old plants give a soaking of liquid manure, a short time after removing a little of the surface soil, and top-dressing with a mixture of turfy loam and short manure, a sprinkling of bone meal improving the compost. Young plants, especially when the body of the house is to be utilised, are the most likely to produce heavy crops of fruit, and these may well be placed singly in 12 inch pots at once. While the weather remains hot and dry these young plants may safely be left in the open, but directly there is a likelihood of a change to colder, damp weather they ought to be housed, or otherwise they may become affected by the Potato disease.

APIARIAN NOTES.

AT THE HEATHER.

AFTER a week's improved weather, of which the bees did not fail to take advantage, a change for the worse came on the 19th inst. High winds prevailed, accompanied by a heavy fall of rain, putting a stop to honey gathering. As the Heather is not yet past, however, the dry season having favoured it greatly both in the extent of growth and profuseness of bloom, in a few more fine days there will be some unusually weighty hives.

Crossed and pure Punics have given every satisfaction, enabling me to disprove every adverse criticism about these bees in Britain and America. One prime swarm two months hived cannot have risen less than 70 lbs., but accurate weights will be given in due course. My time has been fully occupied since I removed the bees here, so persistent in swarming have they been, and are not past yet. If the Punics are the best in the aggregate my two best hives are composed of second cross Syrians unswarmed, and a second cross Carniolan, an old swarmed stock.

Our local bee and honey shows appear to have been a success, but I have been unable to attend any. What I have learned and fully proved at the moors this year will by-and by be embodied in practical articles for beginners, which I trust will be of permanent benefit to them.

CAN BEES COUNT?

My bees stand at the foot of one glen and on the point of intersection to the main one that leads to many others, and behind a stone dyke which runs east and west, the hives facing north. A hive I had forwarded to me was placed at the west end of three

detached hives, and it is bad policy to crowd the hives. The empty hive was placed 6 feet from the western one, the bees and drones of which alike immediately entered, while some of the bees from the next hive entered the westmost one. I then moved it to 20 feet distant, and this time with the entrance quarter round, and still some bees and drones flew towards it. The lesson is the same as that I have so often taught, Never alter the appearance or aspect of hives after September.

Do BEES FLY IN A STRAIGHT LINE?

It is generally believed that bees when returning to their hives fly in a direct line, but this is not verified here. The bee stands were at the foot of a glen that separates two hills. In order to reach another glen situated at a right angle on the hill at a considerable elevation rather less than a quarter of a mile distant, where the Heather is extra fine, and where gold was at one time found and was sometimes wrought for, in a straight line the bees would have come down the hill at an angle, but instead they flew right down the second named glen until they reached the bottom, then turned to the east at a right angle again, flew down the main glen, and past their hives from 150 to 200 yards where the valley and dyke nearly intersect, then over the dyke, reaching their hives on the lee side of it, flying at least a mile further when windy than when calm. — A LANARKSHIRE BEE. KEEPER.

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Grapes Shanking (R. C. N.).—Your letter arrived as we were 1 reparing for press. The matter shall receive attention next week.

Plums under Glass (R. II.).—For training up the rafters of a house with a south-west aspect Denniston's Superb, McLaughlin's, Brahy's Green Gage, and Transparent Gage are excellent. Other four, not Gages, are Jefferson, Washington, Kirke's, and Coe's Golden Drop.

Peaches for Market (S. S.).—We suspect our correspondent will not recommend any particular form of tree as the best under all circumstances. His experience is much too great for that, but he may be expected to refer both to trees grown as pyramids in pots and to trees planted out and trained to trellises.

Potting Tuberoses (Reader).—Tuberoses should be potted so that the tops of the tubers are about half an inch above the soil. The suckers ought to be removed. There is no advantage in keeping the tubers for a second year, as they seldom flower satisfactorily. The three shoots round the crown bud of the Chrysanthemum should be

Anemone polyanthes (L. B. E.).—This fine Anemone grows about a foot to 18 inches in height, with a wealth of fine ornamental The flowers are produced in bunches of from six to eighteen, umbel fashion, on longish scapes. The blooms are rarely less than an inch in diameter, pure white, firm textured, and lasting a considerable time in a cut state. It loves shade, plenty of moisture in rather a heavy but rich soil. The leaves are deciduous; the crown, though exposed, requiring no protection, as it is found at altitudes of from 10,000 to 12,000 feet above sea level from Kashmir to Sikkim, flowering during the carly summer.

Lathyrus sativus (Amateur).—You are right. The Blue Pea (Lathyrus sativus) is one of the prettiest and most distinct of all the annual Peas of ornamental character. It is an old plant in gardens, and yet many persons have never seen it, although it is universally admired by all who chance to see it covered with its clear blue blossoms. Its culture is of the easiest. Seeds sown in drills or clumps in March produce plants which flower in July, and continue in bloom until late in the autumn. All the attention required after sowing is to stake each clump with a few bushy twigs about 2 feet in height. The 3 to 4 seeded pods are curiously

winged along the back. This species has long been grown in South Europe as a forage plant, but its beauty ought to guarantee it a welcome in all good flower gardens.

Keeping Late Grapes (H. P.).—Late Grapes, to keep well, should be thoroughly ripe by the middle of September, which can only be effected by assisting the Vines in spring and early summer with gentle fire heat, so as to have them sufficiently early for ripening the fruit by the time indicated. The Grapcs should be allowed to hang on the Vines until the leaves have fallen, when they ought to be cut with a sufficient length of wood below the bunches to allow of that part being placed in bottles containing water, and all the wood above the bunches should be retained, at least it is best so to do, as cuts increase the evaporation. The oottles should be about three-parts filled with clear rain water, and a piece of charcoal placed in each. The bottles must be placed on a rack, so that they slope to an angle of about 45°, so that the bunches will depend clear of the bottles. The latter will need replenishing as the water wastes, and the Grapes should be examined occasionally for decayed berries, which should be removed as they appear. The most suitable place for keeping the Grapes, failing a Grape-room, is a rather dry room, which can be kept at a temperature of about 45°, or ranging between 50° as a maximum and 40° minimum.

Tomatoes Irregular in Size (S. S.).—When the plants are vigorous and the leaves and trusses large, the fruits are generally uneven in size. The first setting on the trusses are usually the largest, and the next medium-sized, whilst the latest are generally small. The crop is, therefore, easily assorted into three grades. The first, consisting of large fruits, and the last of small, say the size of a Green Gage Plum, are less profitable than the medium-sized fruits, which generally realise good prices. To secure this, judicious thinning is necessary, and if practised early does not impair the total weight of the crop, for by removing the ill-shapen and the latest set fruit on the respective trusses those left swell to an even size. This requires judgment so as to get a full weight of fruit of even sample and have it come in successionally, but the main point is not to overcrop. The hot dry weather has been against the swelling of Tomatocs, and the fruits have ripened in some cases prematurely through the sun being unusually powerful and the atmosphere not having been kept proportionately moist. A slight shade would, no doubt, have improved matters by lessening evaporation and securing the better swelling of the fruit. As the growth is free enough there cannot be anything materially amiss with the soil, but the chief essential to the swelling of the fruit is nitrogen, which is not overabundant in artificial manures, as it is the most costly substance. In a season like the present solid manure is decidedly advantageous on account of the humus and resultant nitric acid, but it is easy to supply nitrogen if the swelling of the fruit is not free enough by dressings of nitrate of soda, a small handful in the powdered state being applied to a space of 8 square yards, or ½ oz. per square yard, it being mixed for facility of application with an equal quantity of dry earth. This supplied according to the needs of the plants and the condition of the soil and weather will be amply repaid.

Sago Palms (A New Reader).—You desire to know something about sago, and from whence it is obtained. Sago is obtained from various species of Indian Palms. In the Indian Archipelago it is procured from Sagus Rumphi, Sagus lævis, and Sagus genuina; on the Coromandel coast from Phœnix farinifera; in Ccylon from Corypha umbraculifera; and in Assam from Caryota urens. These trees are cut down, and from the pith filling their stems the sago is extracted. The pith is thoroughly washed, and from the washing, when allowed to rest, the fecula or starch subsides; this is the sago flour of commerce, of which large quantities are used in the manufacture of calico. When used as food it is granulated, and known as pearl sago. Tapioca is really sago in lumps, and was so called merely because the French, who introduced it from India, named it Sagou-tapioka. About eight thousand tons of sago are annually imported. Sagus Rumphi is a small tree, comparatively speaking, not above 30 feet high. It is a native of the Indian Archipelago, particularly of Malacca, Borneo, Sumatra, Celebes, and the Moluccas. Before the tree has arrived at maturity the stem consists of a mere shell, about 2 inches thick, with a great mass of spongy pith, becoming gradually absorbed, and ultimately the stem remains hollow. At the time when the pith is fully developed, and before it has begun to diminish, which is indicated by the superior leaves being covered with a sort of farina or white dust, the tree is felled, and the trunk cut into lengths of 6 or 7 feet long, which are split to admit of the pith being more easily removed. The pith is in the state of a coarse powder, and is mixed with water in a trough having a sieve at one end; the water, loaded with farina, passes through the sieve, and is received in convenient vessels, where it is allowed to stand till the insoluble matter has subsided. The water is then strained off, and the farina which is left may be dried into a kind of meal, or moulded into whatever shape may be desired. Sago, as it comes to this country, is prepared by forming the meal into a paste with water, and rubbing it into grains; it is produced in the greatest abundance in the Moluccas, but of the finest quality on the eastern coast of Sumatra. The Chinese of Malacca refinc it, so as to give it a fine pearly lustre, and large quantities are also prepared at Singapore. It is said that a single tree will yield from 500 to 600 lbs. of sago. Sago forms the principal food of the natives of the Moluccas. A decoction of sago fermented yields alcohol by distillation, and by ascescence it forms vinegar. The fruit of this Palm is the size of a hen's egg. The base of the leafstalks is covered with long fibrous filaments, that serve to make cordage and sacking.

Names of Fruits .- Notice .- Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. In eonsequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing. The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. (Wm. Huxley).—Apple Pcasegood's Nonesuch. (Evans, Hassoeks).—Duchess of Oldenburg. (F. B. D.).—1, Red Astrachan; 2, King of Pippins; 3, Court Pendû Plat; 4, London Pippin. (R. B.).—1, Brown Turkey; 2, Brunswick.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. P.). — Specimen insufficient. (A. M.). — Lilium lancifolium.

(B. B.).—Adiantum cuneatum.

FODDER FOR WINTER—ENSILAGE.

TROPICAL heat, the thermometer at nearly 90° in the shade, with nine hours of bright sunshine day after day at mid-August, is certainly brilliant harvest weather, and Wheat samples will be so high in quality as to compare favourably with imported corn. But this extreme heat, this parching weather, is fatal to the hopes of those farmers who put off mowing what little grass they had till corn harvest was well advanced, in the vain expectation that enough rain would fall after all to induce some really useful additional growth of herbage. It is true enough that rain has fallen so freely in many districts to thoroughly moisten the soil to a considerable depth, and wherever this has happened pastures are clothed with rich luxuriant herbage, but there are others where the pasture has never recovered from the effects of the drought, and there the outlook is indeed gloomy. Useless for their assistance now is it to dwell upon the folly of laying down the whole of the land to permanent pasture—of starving the land when it is so laid down: we cannot help them. It is to those who were wise enough to sow Rye, Oats, Italian Rye Grass, Tares, and Peas or Beans as catch crops, that we turn to urge them to do their utmost to preserve and store as much of such fodder as they can for use next winter and spring.

In the prevalent hot weather, any of it that is sufficiently forward in growth can easily be made into hay, but most of it will not be ready for moving till unsettled weather and shortening days render haymaking much too speculative to be safe. Recourse must then be had to ensilage, as a simple, sure, and efficient means of preserving fodder in a wholesome nutritious condition. Prejudice and ignorance may try to oppose it, but in such a crisis no quarter must be given to any nonsense of the kind. There has been too much forbearance shown in this matter, and we believe that among the lessons of adversity taught by this trying year, the real value and use of silage will take a prominent place.

No longer is it necessary to build costly silos as receptacles for chaffed fodder—that is one of the things we have had to unlearn. Nor do we require any of the costly patent pressing apparatus which keen implement makers speedily placed on market in response to an apparent want. Experience has shown that green forage mown and placed in a sufficiently compact heap in layers of a yard thick, with an interval of three or four days between the stacking of each layer, will afford an invaluable store of nutritious food for horses, store cattle, cows, sheep, and lambs. To go fully into detail, let us explain what is considered as the best way of making a compressed silage heap at the present time. It requires some practice to enable one to decide beforehand upon the size of the heap. The fact of a cubic foot of a well-made silage heap weighing half a hundredweight shows how closely it can be pressed together. Bearing this in mind, with a calculation as to the weight of crop per acre, should enable one to decide upon the size of a heap which when finished is to be 6 feet in height, on a clear level place, easy of access, and near the yards. Mark, for example, a space 18 feet wide by 36 feet long. Upon this cart and shoot the forage as it is mown, spreading it out regularly, keeping the sides upright, but making a slope with the forage at each end for the loads to be drawn upon the heap, and the empty carts to pass off at the other end, just as is done in making a Suffolk manure heap. This carting upon the heap helps to make it

compact; a horse drawing an iron roller is also kept going over it till a firm layer 3 feet high is made. This layer is then left to settle and heat for three or four days, a thorough rolling with the horse and iron roller being given daily. Then another layer is put on and treated in precisely the same way, the heap being thus gradually built to a height of 6 feet. The sloping ends are then cut off with a hay knife, thrown upon the top of the heap, spread out and well trampled down, so that ends and sides are all left perpendicular. The top is then weighted with timber-rough logs answer perfectly well-topped up with rough litter or straw and thatched. Of course there is some heating, but the gradual construction and pressure prevents excessive or hurtful heating, and the silage becomes cool in about three months. At half a hundredweight to the cubic foot, the contents of such a heap work out at about 97 tons, and the fortunate owner of it might well be an object of envy to his brother farmers in the coming winter. The difficulty—the only difficulty, is to get enough green forage, not necessarily of the same sort. It may be a mixture of green Oats, Rye, Rye Grass, Lucerne, second cut of Clover, Tares, or mixed seeds, it matters not which; all or any of them treated in the simple manner described will make an aromatic heap of fodder that will prove invaluable for stock feeding from Christmas till May day, or longer if necessary.

We had written the above before seeing the hints on special ensilage which the Board of Agriculture has sent out, and which appeared in the last number of the Journal. They are certainly well timed, and will do good if they induce farmers to save every scrap of spare herbage, and store it for winter by ensilage. Our details of the process were advisedly confined to the making of clamped silage, because of its facility, economy, and certainty. After the clamp is made the two important points are pressure and thatching to throw off rain. By all means use dry earth if it can be had; but bearing in mind how doubtful that is in autumn, we think it better to recommend the use of logs of timber. Anything heavy will do-we used slag from an old blast furnace for our first silo-so as to keep a steady pressure upon the heap, then top up to a sufficiently acute angle and cover with thatch of straw, reeds, rushes, heather; with corrugated iron sheets, weather boards, felt, or anything to throw off rain and keep the silage dry. Soil alone will not do this, and we certainly think the Board of Agriculture's advice to use it for a covering as risky. We repeat, use plenty of pressure, and keep out the rain, if you would preserve silage in good condition.

WORK ON THE HOME FARM.

At the Royal Show at Chester an enterprising seedsman had a bundle of drought-resisting fodder plants with very long roots on his stand. He was wise, because particular attention to such crops has been forced upon the grazier this summer. We hope it may lead to the more general culture of Lucerne, which, good as it always is, has stood out conspicuous for its superiority over all other forage plants without any special culture beyond that followed in ordinary practice. With its roots deep down in the soil it has passed through the drought unscathed, unaffected by it in the slightest degree. The three growths of it have given an aggregate in height of full 10 fect. What would graziers in Leicestershire with their hay crop barely 10 inches high, or Kent and Sussex farmers with no hay at all, say to this? Often when urging the value of this crop and its easy culture upon tenant farmers have we been told that soil must have lime in it for Lucerne. Well, we would certainly give land a heavy dressing of lime rather than go without Lucerne, and we once more earnestly recommend it for general cultivation.

Second crops of Clover are much heavier than was the first crop. They are being mown and made into hay with great facility now, the demand for hay of any kind being so general that very little Clover will be left for seed. Harvest work, and the breaking up of stubbles, has been going on briskly. Sheep-folding on a capital crop of White Mustard helps to ease the pastures. It makes a wholesome change for the flock, and the land is enriched for a crop of Winter Oats.

We have had many complaints of fly striking among the sheep of our correspondents, a special grievance being made of flies attacking sheep so soon after they have been dipped. It should be clearly understood that while dipping may give sheep immunity from fly attacks for a short time, its special work is to destroy at the time of dipping all

parasitical insects in the wool or upon the skin, especially those terrible blood-suckers, the ticks, which irritate the sheep to such a degree that they are practically never at rest, and cannot thrive. Dipping soon after shearing, and again in September, is usually all that is required; both are indispensable, and are usually sufficient. Fly attacks are to be expected daily and hourly in such dry hot weather as we are now having, but there can be no material harm from them if the flock has proper attention. That is the point—pains and care, very little science is wanted. We recently went through the flock of a veterinary surgeon, and found several bad cases of foot-rot; evidently the man of science was not a careful, hardly a humane man.

OUR LETTER BOX.

Thistles (B.).—To destroy Thistles they must be pulled up by the roots. On arable land this is done by repeated hoeing among root crops, or by thorough autumn tillage, ploughing, harrowing, deep stirring with cultivator or horse hoe, so as not only to sever the roots well beneath the surface, but to bring the loosened plants upon the surface, to be killed by exposure, or, better still, collected and burnt. On pasture, the practice of mowing Thistles once or twice during summer may weaken growth, but we always regard it as a waste of time and money. them up once for all, and there is an end of them; we have had them pulled up by hands protected with stout leathern gloves when the land is softened by heavy rain, also dug up with dock spuds. The plan may be tedious, but it is certainly thorough. Never suffer a Thistle to run to seed; turn every one to the rooting up of them at odd times, and by the exercise of a little perseverance you will get rid of them. Show this to your neighbour, and at any rate try and induce him to prevent Thistle seeding. We have known an entire parish to become infested with this pest by seed blown about it from the land of a slovenly farmer. That farm eventually came into our hands. By steady persistence we got rid of the Thistles. If your land is as badly infested by them as that was, you will have a very clear idea of the true meaning of perseverance before you have done with them before you have done with them.

POULTRY IN FRANCE.—The income derived by French people who rear fowls, says an industrious statistician, according to octroi and market returns, is 337,100,000 francs, of which 153,500,000 francs represent the value of the flesh, and 183,600,000 francs that of the eggs. The quantity sold in poultry yards is immense, as is also the number used in the homes of those who rear fowls. These figures do not find their way into statistics.

THE HARVEST IN THE MIDLANDS.-Midland farmers, a daily contemporary asserts, have had greater advantages for in-gathering their crops this year than they have had for nearly a quarter of a century. It is estimated that Wheat on the average will yield from four to five quarters per acre, which is above the usual produce, while the quality is exceptionally good. Oats again are far above the average, and are already so ripe that thrashing can begin as soon as the crop is cut. It is complained that the straw is short; but the farmers have the compensating advantage that both quality and quantity are fairly excellent. During the past few days considerable progress has fairly excellent. During the past few days considerable progress has been made with the in-gathering, and the result so far has created much satisfaction.

REMARKS.

13th.—Bright sunshine early, but haze and cloud gradually accumulated, and only occasional gleams of sun after 11 A.M.
14th.—Calm, hazy, and oppressive throughout.
15th.—Sunny and hot; hazy, with a little cloud in morning, and solar halo about 11 A.M.

11 A.M.

16th.—Hot; almost cloudless till 3.30 P.M.; solar halo about 4 P.M., cloudless again by 5 P.M.

17th.—Sunny and hot throughout, a little hazy in the morning.

18th.—Almost cloudless, with very high temperature, but breezy and pleasant; distant lightning at night.

19th.—Cool and pleasant, with sunshine at times.

A very hot week; probably the hottest recorded here since the observations commenced in 1858. The 9 a.m. temperature on 18th (84.3°) is without precedent in the thirty-six years, and the 16th, 17th, and 18th are the only instance of three consecutive days with max. above 90°. The temperature of 93.6° on 18th has only once been exceeded, namely on July 15th, 1881, when 94.6° was recorded.—G. J. SYMONS.

VER all the fruits that are grown in our island home the Apple remains king in usefulness; but it has to be said that the fruit, broadly and generally speaking, is not yet represented in kingly fashion. In too many instances it lacks dignity, and does not command the respect to which the fruit when seen in its full nobility of character is justly entitled. Apples were on the down grade for many a year, but their course was checked by the efforts of men who believed them worthy of a better fate than that to which they were being driven by apathy, ignorance, and neglect. The Apples of Britain, taking them in the bulk, a dozen years ago were a disgrace to the nation and spurned by its inhabitants in favour of the better, larger, brighter samples from other lands; yet the soil of those lands was no better than in our own, the varieties no better, the enemies no fewer, the climate no more favourable as a rule to the growth of Apples than that which generally prevails in this country. Impediments have to be encountered everywhere, and losses periodically sustained, but this is the case with the production of all crops that are influenced by the weather, as both farmers and gardeners know too well; and whatever the obstacles in growing fruit, those persons who adopt the best methods are bound to have the greatest success, as in the splendid Apples exhibited in the Agricultural Hall, Islington.

When the planting of Apple trees much more extensively than formerly was being so strongly advocated during what may be termed the fruit crusade, many persons feared that if the advice were followed the country would soon be so full of fruit that the crops would "fetch nothing." Undoubtedly the effect of the agitation for growing more and especially better fruit in this country resulted in the planting of millions of trees and bushes over thousands of acres of land. Great numbers of those trees are now in bearing, and the fruit is leaving its impress on the markets. Broadly speaking the result so far is to render the small scrubby Apples from old or exhausted trees not worth sending to market, while fine fruit from young trees finds a ready sale at prices, if not high yet remunerative to the grower. As the supply of first-class fruit increases in bulk prices would inevitably fall but for two great counteracting influences-1, the constant increase in the number of consumers; 2, the increased disposition of the public to purchase fruit when it is of the best appearance, good in quality, and obtainable at a moderate price. Inferior fruit is repellant to thousands, and they will not have it at any price, but bright, good sized, speckless, and tender-looking specimens are so tempting as to become irresistible. Several instances could be cited of the uselessness of third or fourth-rate Apples and of the value of first-class produce to the grower, but one must suffice at present.

W. H. Myers, Esq., M.P., is a gentleman who takes great interest in improving his estate, not because of the advantage of this to himself alone, but because, while he may eventually gain, a number of men are in the meantime benefited by the employment afforded in establishing extensive plantations of Larch and other trees. These plantations will be more profitable in the end than the land surrounding under agricultural tillage; but fruit trees have also been planted at Swanmore by Mr. Myers' gardener—not many, only about 2000—and though the oldest of these trees have only been planted three years, some of them are already giving an encouraging return. The fruit from these young trees as grown

in good and well-prepared soil is, so to say, "run after" at 5s. a bushel; while the crops of smaller fruit from old and more or less enfeebled orchard trees would be gladly disposed of for a fourth of the price, yet more time is involved in gathering the latter than the former.

This Swanmore experiment in Apple culture is suggestive and instructive. In the first place varieties were wisely chosen that had been found to succeed the best in a small orchard planted fifteen years ago. These were mainly Warner's King, the tree never failing to yield magnificent fruit, Ecklinville and Mère de Ménage as cooking Apples, with Worcester Pearmain, King of the Pippins, and Cox's Orange Pippin as table fruits. Several other sorts including Blenheim Pippin did not succeed half so well in the strong loam resting on chalk, and, therefore, were excluded from the new plantation; but other varieties of repute were included. A grass field of 5 acres adjoining the garden was devoted to this Apple growing experiment. The position is elevated and open, and in those respects favourable to the blossoms escaping destruction by spring frost in comparison with those of trees in low, damp, and confined enclosures.

One portion of the field was planted with standard trees 30 feet apart, and a bush tree between each two standards in the lines, also a row with the trees 15 feet asunder between the rows of standards, thus in this portion the trees stand at the distance last named. They are on grass, each planted in a prepared station, 4 feet wide and 2 feet deep. The soil is kept free from weeds and loose on the surface, not by digging but with the hoe. The growth has been so good and the root action so free that the ground has been broken in circles a foot wide and 18 inches deep outside the stations to permit of root extension in the upper layer of soil. The trees were pruned after planting to obtain the requisite number of branches, and have made admirable progress. Some that made very free growth, suggestive of exuberance, were simply taken up and replanted - an excellent plan for enhancing vigour and inducing fruitfulness not sufficiently practised. When once bearing commences the fruits will keep the growth in subjection. All the lifted trees are replanted higher than before, and it is found that the higher the mounds are in reason the more satisfactory is the growth, as combining adequate extension with firmness and blossom-forming proclivity. Some of the mounds are 18 inches high, few less than a foot above the ground level. On trees that are in bearing and mulched with manure the fruit is magnificent, and fine enough to sell in any market where the trees are not mulched, as is the case with the majority. This orchard on grass will be profitable in another year or two, and numbers of the trees have paid for themselves and something more already.

The other half of the field was wholly broken up and planted similarly, but extra rows of maiden trees were planted between the standards and two-year-old bushes, so that the whole stand $7\frac{1}{2}$ feet apart. This is the way to obtain the most money off the ground by the sale of Apples at a small extra cost in planting the maidens, though no doubt a still earlier gain would be had by inter-planting with Gooseberries; but this is an Apple experiment. The standard trees are included in case at any future time, as they advance in growth, the dwarfs can be gradually removed, and the ground beneath the tall standards devoted to grazing, if it should be required for that purpose, and it is proverbially difficult to foresee what may be wanted eventually on a gentleman's estate, as the fancy of some owner may turn in the direction of live stock in preference to fruit. For producing the greatest abundance of the best Apples, cultivated fruit gardens is the system to adopt, and in suitable soil and positions, combined with good management, the work may be expected to prove fairly remunerative even if the prices for fruit fall lower than they are now, always provided the produce is of high quality and of uniformly good throughout the bulk. Second and third rate fruit carelessly marketed cannot be expected to pay in the future. For the very best home-grown

Apples there always has been, and it is reasonable to suppose there always will be a ready sale.

Returning to the varieties in Mr. Myers' experiment the standard trees consist of 100 Worcester Pearmain, forty-six Ecklinville, thirty-six Cox's Orange Pippin, and fifty Bramley's Seedling. The dwarfs comprise 250 Warner's King, a variety that would be increased in an extension of planting; 220 Ecklinvilles, too many, as the fruits are soft and liable to be specked; forty Mère de Ménage, a satisfactory proportion; twenty Worcester Pearmain, not nearly sufficient, as the fruit sells so well; forty Irish Peach, not profitable, and would not be planted again for market purposes; 120 Lady Sudeley, as coming in just when wanted, would be increased; seventy-five Cox's Orange Pippin, would be considerably increased; thirty King of the Pippins, sufficient, crop good, and fruit fine, but not bright enough; twenty-five Lady Henniker, too many, tree too large, and a sparse bearer; 550 Lord Grosvenor, one of the most profitable of all, and would be largely increased; 100 Bramley's Seedling, growing and bearing so well that it would be considerably increased both in the form of standards and dwarfs; 125 Lane's Prince Albert, of which many more would be planted; 100 Stirling Castle, such an early and bountiful bearer that it would be planted more extensively.

In respect to the bearing of the young trees in the plantation, Bramley's Seedlings, as standards and dwarfs planted in 1890, are carrying from twenty to twenty-five fruits 10 inches in circumference, and are not blown off the trees. A maiden planted last autumn had three fruits 12 inches in diameter, heavier than itself, pointed to as not a "slow" bearer. Warner's King and Lord Grosvenor, bearing twenty-five fruits 13 inches in diameter, 35 bushels being sold from the latter at 5s. a bushel; Stirling Castle, overladen, fruits good, but unduly taxing the trees; Lane's Prince] Albert, young trees, supporting twenty to thirty splendid Apples, and making satisfactory growth; Cox's Orange Pippin carrying fifty to sixty handsome fruits, several girthing 9 inches.

Of the varieties grown in less numbers, the Queen and Cox's Pomona were promising well, as were Bismarck, very fine Wealthy, Wiltshire Defiance, and Sandringham, very large; Queen Caroline, beautiful; Golden Spire, and Frogmore Prolific. Of table sorts, Devonshire Quarrenden has paid well, and Mr. Molyneux wishes he had several hundred trees of Benoni and several hundred bushels of Worcester Pearmain. He finds a great dearth of table Apples between the first earlies—such as Red Astrachan, Mr. Gladstone, and others—and the autumn bearers, hence the special value of such as Lady Sudeley, Worcester Pearmain, and Benoni, and of these he would plant largely, in the full assurance of a ready sale. Upwards of 100 of the best varieties in cultivation are on trial at Swanmore, including most of the new sorts, the object being to ascertain by comparison those most likely to give the best return if extensively planted for commercial purposes. This well conducted experiment in Apple culture will be of practical value to intending planters, and Mr. Myers and his gardener are to be congratulated on the progress already made, as well as on a promising future.

HARDY FLOWER NOTES.

MORINA LONGIFOLIA.

THERE are few hardy flowers which attract more attention than a good specimen of Morina longifolia when in full bloom. The long, glossy, somewhat spiny leaves are very pretty, and the handsome spike with its crowded whorls of white and crimson flowers add to the appearance of the plant. It seems to be a favourite wherever grown, and it is to be regretted that it does not prove a true perennial on all soils. It is so easily raised from seed, which it ripens abundantly, that it can be readily replaced; and it may be noted that young plants transplant much more successfully than older ones, as the long tap roots are liable to injury. One of the pleasing features of this plant is the variety presented by the flowers in their various stages. The buds are

white, and when open the flowers are of a pretty pink, which again passes off to a fine bright crimson. The flowers have rather long tubes in proportion to their breadth, these being about 1 inch, and the flower about three-quarters of an inch across. The blooms are produced in whorls in the axils of the flowering stems, which attain a height of 2 feet or more. The leaves are from 10 inches to upwards of a foot in length, and are pinnatifid.

to upwards of a foot in length, and are pinnatifid.

Morina longifolia will be found to thrive well in a rich but somewhat light soil, and prefers a little shade. The customary period for flowering here (Dumfries) is July, but occasionally a plant will fail to bloom in the ordinary season, and throws up a flower stem in late autumn. Even a plant which flowers in its usual course will sometimes throw up late stems. A fine spike on one of my plants was just beginning to open late last October, when a severe night's frost destroyed it. It is a native of Nepaul, whence it was introduced by Wallich about 1839. Seeds may be sown in pots or boxes as soon as ripe, and placed in a frame, or they may be kept until spring, and sown in the open ground in March or April. With good treatment plants should flower the second season. Division of the plants is also practised, but this should not be attempted unless they are a fair size.

The genus Morina was named in honour of Louis Morin, a French botanist, who existed in the end of the seventeenth and beginning of the eighteenth centuries. The first species of the genus which was introduced was M. persica, discovered by Tournefort. Besides this, and the subject of this note, there are some half a dozen other species, all being natives of Asia. Few of these are in cultivation in this country. The Morinas belong to the natural order Dipsaceæ, and a synonym of the genus is Asaphes. An illustration of M. longifolia is given in the "Botanical Magazine," tab. 4092; in the "Botanical Register," vol. xxvi., plate 36; and one may also be found in Maund's "Botanic Garden," vol. v., plate 197. The latter only shows part of the spike, and consequently does not do full justice to the symmetry of the plant. Morina longifolia is one of the flowers which can be recommended with every confidence.

COREOPSIS MONSTROSA.

The specific name of monstrosa has occasionally been applied in a most inappropriate manner to flowers, and it cannot, I think, be denied that here we have a case in point. Judging from the appearance of Coreopsis monstrosa from a garden or from a structural point of view, there is nothing about the plant which would give warrant for according it a specific name far from appropriate to such a graceful flower, for this plant shares the grace of its congeners, which, as a whole, are exceedingly beautiful in habit. It seems to be a plant of garden origin, and only a large-flowered and extremely fine form of one of our most beautiful garden flowers—C. lanceolata. The habit of the plant is more robust than is the typical C. lanceolata, and it may be recommended as a decided improvement upon the latter. I have seen this plant in various gardens and soils, and taken as a whole C. monstrosa will bear favourable comparison with the much-praised C. grandiflora, its bright clear yellow flowers being of good colour and form. There seems to be no special difficulty in its cultivation.

MORISIA HYPOGÆA.

Although I have recently written of this neat rockery plant, some additional information as to its propagation may be of interest, especially as I have failed to discover any reference to this system of propagation as applied to the Morisia. This is by means of root cuttings, a well known and useful method of propagating many flowers. In lifting a plant of M. hypogæa for the purpose of taking off cuttings and dividing the plant, an examination of the character of the roots caused me to be of opinion that it could be easily increased by means of cuttings of short pieces of the root. Several of the roots were taken off, cut into pieces about an inch in length, inserted in pots of light sandy soil, and placed in a cool greenhouse. The upper or thicker end of each root cutting was of course placed uppermost and so placed that it was just under the slight layer of sand with which the pot was surfaced. In about a fortnight leaves began to appear from the apex, and the plants produced in this way are nearly as large as those obtained by ordinary cuttings of the stems inserted the same day. The cuttings were taken off in the end of June.

CIMICIFUGA SERPENTARIA.

Whatever may be said for the literal accuracy of the name of Serpent-like Bugwort, all who have seen this flower will, I feel sure, agree in thinking it a most unpleasant one for such a pretty occupant of our garden borders. I fear even the Rose if burdened with the name of Bugwort would hardly "smell as sweet," and one is tempted to wish for a revision of some of the names which, like the plants themselves, have come to us from the other side of the

Atlantic. Until, however, some authority can give us a better name and secure its general acceptance, we must, I suppose veil it under the Greek name which, although of similar meaning, disguises to ordinary ears the unpleasant reference of which we

In Mr. Nicholson's "Dictionary of Gardening" C. merpentaria is described as a synonym of C. racemosa; but, while this may be the case from a botanical point of view, for garden purposes the plants sold as C. racemosa and C. serpentaria are very distinct in the appearance of the inflorescence, the former having straight, erect racemes of flowers, while the subject of this note has its racemes twisted and abruptly bent in a curious manner, whence, I suppose, the derivation of the distinctive or specific name of ser-In general this form in flowers is not particularly attractive, resembling as it does the effect at times produced by blooms which have for some time been laid prostrate, and have then been staked and tied to an erect position, thus frequently giving the flower spikes a twisted appearance. In C. serpentaria, however, this is not so, but the abrupt angles and contortion renders the plant more interesting, and in no way detracts from its beauty. I find, indeed, that this Cimicifuga is being more frequently sought for, and much disappointment is felt when, as is not unfrequently the case, the ordinary C. racemosa is supplied.

I have recently seen some fine specimens of C. serpentaria, and in the garden at Cavens, Dumfries, N.B., several fine plants about 5 feet high had a good effect in a long border contrasted with Aconitum bicolor. The Cimicifugas belong to the large family of Ranunculaceæ, and are very beautiful in a border suited to the growth of the taller herbaceous plants, where with a little shade and a fair amount of moisture, they will soon form handsome clumps. They are readily propagated by division, or by means of

seeds, sown as soon as ripe.

EARLY FLOWERING OF AUTUMN BULBS.

The warmth of the past season has ripened bulbs early, and the rain which succeeded the great heat has pushed many into growth, thus bringing several plants which generally flower late in autumn into premature flower. Thus Leucoium autumnale came into flower the first week in July, and Colchicums Bertoloni and C. latifolium came into flower on July 28th and 29th respectively. One can hardly say that their appearance was welcome at this early season, when flowers were plentiful, and we looked forward to their succeeding other plants, and bridging over what is usually a comparatively dull season.—S. ARNOTT.

ORCHIDS AT CHELSEA.

THERE were not at the time of my visit to Mr. Bull's the other day a great number of Orchids in bloom, as the season has cleared them off much more rapidly than usual. However, what there were assisted materially to brighten the structures devoted to their culture, and particularly noticeable amongst those in flower were Cypripedium cenanthum superbum, a very beautiful piece of Angræcum descendens, the blooms of which were diffusing a faint but pleasing fragrance; Habenaria militaris, little plants of which were throwing up their brightly coloured blooms; Oncidium Kramerianum, Saccolabium Blumei longiracemosum in fine condition, and several richly coloured Lælias purpurata and elegans. On many of the Orchid pots were to be seen pieces of Potatoes placed as traps for woodlice.

LÆLIA MONOPHYLLA.

WE have no more charming little summer flowering Orchid than this. There are about a dozen examples of it in flower in the cool Orchid house at Kew, each bearing from six to a dozen flowers of elegant butterfly form, and coloured vivid orange-scarlet. have heard of a plant which bore three flowers on a scape, but all of the plants at Kew have only a single flower on each scape. The pseudo-bulbs are no thicker than a knitting-needle, 6 inches long, each bearing a single narrow leaf 3 inches long. The scape is slender, curved, 3 inches long, and the flower is between 1 and 2 inches in diameter.

The Kew examples have been in flower a fortnight, and the flowers are, at the time of writing, still quite fresh. They are grown in a cool house along with Masdevallias, and they get a fair supply of water all the year round. This species was first intro-

duced and flowered at Kew in 1882, plants having been found by Mr. Morris in Jamaica on St. Andrew's Mountain at an elevation of about 5000 feet. Mr. Norman Cookson is trying to cross it with other species of Lælia.—W. WATSON (in "Garden and Forest").

ORCHIDS IN NORTHUMBERLAND.

Anyone visiting Morpeth, the former capital of Northumberland, would scarcely at first sight be aware, or expect to find, so large an area of glass houses devoted to plant and Orchid culture as that possessed by Edward Hopper, Esq., of Riverside. collection of Orchids is one of the best in Northumberland. On a recent visit I had pointed out to me Dendrobium giganteum with four blooms, Oncidium papilio majus, 5 inches across, very fine; and Odontoglossum Uro-Skinneri, so very suitable for buttonholes. Amongst other plants must be mentioned Clerodendron fragrans for its pleasing perfume; Hedychium album, a charming white flower, and the curious Strelitzia Reginæ with ten spikes.

Mr. Hopper is a great botanist, and possesses one of the finest botanical libraries in the district, is a warm enthusiast, and always glad to meet persons interested in gardening. He has now secured the services of Mr. James Wood as head gardener, and the place is a credit to the latter's gardening skill, which is well known in the north of England.—Bernard Cowan.

INSECTS OF THE FLOWER GARDEN.

(Continued from page 93.)

SINCE the mites are insects that are to be found almost everywhere, indoors and out, we may be sure they have some representatives in every flower garden. Tropical countries can furnish specimens belonging to this group which are as large as a pea, but all our British species verify their name—they are but specks of life, and many are so tiny that they can scarcely be seen without a magnifying glass. Like the aphis and some other insects of small size, their numbers enable them to produce results they could not otherwise accomplish, and there are species that give us trouble, even in the cultivation of flowers, a few being particularly noticeable. It is only of late that attention has been called to the economy of these insects, and, in the case of some plants and trees, it is likely to remain for the present a doubtful matter whether the mites upon them are a cause of disease or its consequence. mite most familiar to us in houses and gardens is the annoying red spider (so-called), and its useful relatives, if endued with intelligence, might very well disown a species having habits so unlike theirs. Juvenile mites are not much different in appearance from full-grown specimens, except that they possess but six legs, eight being the complete number; nobody has ascertained yet how long their life lasts. All species have the abdomen neither segmented nor stalked, but more or less rounded, and joined on to a small thorax bearing the legs. It might be desirable in some cases to destroy their eggs; the minuteness of these is a difficulty, however. Also it has been suggested that they are wafted by the air from the place where they are laid to another spot, and certainly their sudden appearance at times is mysterious, for the insects themselves are not of migratory habit, or but rarely.

Of all the mites, the spinners come nearest to the spider proper, since they are able to weave a web, having claws specially adapted to this, and a spinning apparatus. The mouth has a barbed sucker, and mandibles or jaws as well; and some suppose that those of the spinning mites which act as blood-suckers throw into the tiny puncture they make some kind of poison. Specimens of both groups, of the vegetable feeders and of those that are predacious, are to be noticed in flower gardens. Those of the former are the smaller, and of pale or dull colours, also semi-transparent; those of the latter are velvety and opaque, in colour some shade of red or black. One of our worst enemies is the red spider, Tetranychus telarius, a strict vegetarian, and which, though most troublesome in houses, abounds upon some exotic plants in beds and borders. call it red, and many of these insects are of some shade of red, but others occur that are green or brown, hence some have been thought to be distinct species. An entomologist noticed upon the Hollyhock red spiders of various colours, possibly of different ages; and upon the Rose, in some districts, some occur of pale green hue, and almost transparent. Boisduval thinks that red spider rarely almost transparent. appears on the Rose if the tree is healthy, and also with Camellias and Dracænas; it is plants out of condition that the insect seems to single out for attack. This insect is so notably a lover of warmth that it has been observed, in some instances, to die off plants that have been shifted from houses into the open air, being unable to stand the change of temperature. But it may often be found flourishing under the ordinary conditions of our climate, and a dry spring and summer, such as we have had, must have favoured

the increase of red spider out of doors, while many plants were less able to resist its attacks. The injury done arises from the combined results of biting and sucking, also the leaf-pores are choked by the secretions of the insect. With the aid of a hand magnifier we can perceive, upon the under side of leaves chiefly, the manner in which red spiders group themselves, scores, or even hundreds feeding together, the party including specimens of all sizes and ages; but the juveniles are, of course, very minute in their first stage, semitransparent, and more sluggish than those that are nearly or quite full grown. The eggs are large in proportion to the insect; but it is also the fact that individuals partly grown, and with their legs tucked in, presumably in the act of changing their skins, have been taken for eggs. It is not certain whether, in the open air, this species passes the winter in the egg state. French entomologists think adults hybernate under stones and in odd corners, to resume activity in spring, depositing eggs then, which give birth to the new brood. It would seem that the web is the united work of several of the older individuals on a leaf, the minute claws and hairs of the legs being employed. It is both a protection and a help to loco-motion, for the mite has some difficulty in crawling upon the surface of smooth or slightly sticky leaves. When spraying and syringing to destroy this insect, either with Gishurst compound, sulphur and soap, or whatever other remedy may be tried, it is necessary to remember that little good is done if the under side of the leaves is not thoroughly wetted. Red spider is kept in check by many insect foes, or it would do us much more harm.

Some people who are liable to be attacked by what is often called the "harvest bug" are very careful to keep away from corn fields during August, not knowing, perhaps, that this pest may attack us in our own garden. The harvest bug, T. autumnalis, which is another of the spinning mites, occurs not only about fields but amongst Beans, Currants, and Raspberries, also on some herbaceous plants in our borders, and upon the grass of lawns. It is a brownish red, but very minute, so that it is not easily seen; but it can make itself felt. People often suppose that have been bitten by fleas or gnats, when they have been insidiously attacked by this mite, which sometimes, though not always, buries itself under the skin, raising a lump or tumour. Some persons present no attractions to this insect, others suffer much from it, and it frequently assails the domestic cat, owing to its habit of prowling about gardens in quest of birds. Cats have been found to have swarms of harvest bugs on their feet and legs, causing the supposi-tion that they are suffering from itch. A curious fact is, that before they transfer themselves to man and animals these bugs have been feeding upon vegetable juices, which they quit to become bloodsuckers. Another of the harvest mites has been noticed by thousands upon the pebbles of garden walks near London, having, it is thought, been conveyed there with gravel. This is Trombidium lapidum, rose red when young, afterwards brown or brownish red, with a few white spots. Probably the insect afterwards attaches itself to various low plants. Another of this genus that occurs in gardens is T. holosericeum, a mite with an array of barbed hairs on its back, which is very plump, and scarlet in hue. Mr. Stewart states that it is useful, because it devours aphides and small newly hatched caterpillars.—Entomologist.

NOTES BY THE WAY.

BRAMBLETYE is a name that calls up recollections of pleasant country lanes, margined by hedges heavy with the sprawling, rambling growths of Blackberries; but it is not by such ways that it must be sought. The place lies on the main road from East Grinstead to Maresfield, Nutfield, Uckfield, and so on in the direction of the coast. From Oakleigh, which is on the left, to Brambletye, which is on the right, is but a short walk, and neither time nor trouble need therefore be expended in reaching it. The place is in the occupation of Donald Larnach, Esq., a wealthy Australian, or Scotchman with Australian connections, and it is certainly one of the finest estates in a neighbourhood which is far from being poor in imposing establishments. The house is a fine one, commanding splendid views of Ashdown Forest and the southern range of hills. It stands out boldly in its tree-clad eminence, and can be seen for many miles around.

With the gardens of Brambletye was for a long time associated the name of an excellent cultivator—Mr. Jenks, but he is now installed in a little nursery in the adjoining village of Ashurst Wood; and a stalwart broad-shouldered Scot, in the person of Mr. G. F. Glen, reigns in his stead. I do not know whether the latter emulated the feats of the famous Donald Dinnie in his younger days; he certainly looks big enough, and strong enough too, and in his brogue there is the burr of a mighty bass. Before coming into Sussex he had charge of the extensive gardens at Wentworth Woodhouse, Lord Fitzwilliam's splendid Yorkshire seat, and has therefore had the experience which stands a man in such good stead when a large place is offered to him. Between Yorkshire and Sussex there is a difference other than that of so many miles.

The true Yorkshireman is of quite a different type to the Sussexite, and doubtless therefore the Anglo-Scottish gardener finds the conditions of work much at variance with those in the northern county.

Brambletye is a large place, and the flower garden is some distance from the kitchen garden and houses. To the former Mr. Glen did not lead me, considerations of the presence of "the family" operating with him so far as I could understand. A gardener should always place the wishes of his employers before any desire to have his own handiwork admired. The impulse should be respected even while due weight is given to the fact that most gentlemen make a wide distinction between visitors who come to pourtray the beauties of their estates and those who come to ramble round out of mere curiosity, or perhaps to find openings for adverse criticism. If a gardener has a fine house of Grapes, representing in a great measure his own cultural skill, he likes to have it appreciated, and quite right, say I; similarly, if a gentleman has a beautiful house and grounds he does not disapprove of their being admired, but in nine cases out of ten is glad to have others express their pleasure in them, but always at a convenient time.

But if, from the reasons given, I am not in a position to say what Brambletye is like from the main ornamental point of view there is a side issue to which I gladly call attention. This is neither more nor less than a sub-tropical garden formed on the site of a large rubbish heap at the entrance to the kitchen garden. What transformation could be more striking? At the theatre one sometimes sees a gay ball-room scene succeed a representation of a thieves' kitchen, or a stately street of palaces and temples follow a hideous slum. Mr. Glen has directed his scene-shifters with such wisdom and boldness that he has produced something well worthy of comparison with the best efforts of a Telbin. This little sub-tropical garden—the word "bed" is insufficient—is one of the most admirable ornamental features of a large place that I have seen in any garden this year. I understand that its conception was due to a special wish of Mrs. Larnach, and everybody is to be congratulated on the resul't.

The little garden is not a stiff square nor a formal parallelogram, nor, if I may be permitted to say it, an equally stiff and formal circle. It is undulating and flowing in outline, with graceful sweeps and curves, possessing that free informal character which everybody so much admires, but rarely, if ever, imitates. It is as boldly planted as it is admirably designed. Stately Musas uprear their huge leaves, and the beautifully marked foliage of Lavatera arborea variegata shows up well. This fine plant is as effective in form as it is in the markings of its leafage, which, by the way, were not half developed at the time of my visit. Ricinuses also play an important part, Gibsoni and Obermanni being very conspicuous, as do Atriplex hortensis rubra, Abutilon Thompsoni, Wigandias, Coleuses, Agapanthuses (giving a welcome tone of colour against the masses of foliage), and Zeas. A pleasing carpet or groundwork is formed of the little Königa variegata. And all this in the place of a rubbish heap!

There are other ornamental features about this part of the garden. For instance, it is observed that the exterior bases of all the houses are furnished with flowering plants, in which Zonal Pelargoniums and Heliotropes shine conspicuously. This entirely does away with the bare appearance which usually prevails. And the interior of the fruit houses is also brightened up with plants, for which a sort of platform stage is provided at the side of the path. This is the wish of the ladies of the house, and there can be no denying the beautiful and cheerful appearance that it imparts. Amongst them are noticed Globe Amaranths, Celosias, Musk, Petunias, Lobelias, Coleuses, Diplacus glutinosus, Francoa ramosa, Fuchsias, Nicotiana affinis, Hydrangeas, Achimenes and Gloxinias, all clean, healthy, and flowering freely. It is easy to imagine many gardeners declaring that it is quite enough to grow Peaches and Grapes without having plants to bother about as well, but it is done at Brambletye, and the result is very good. Æschynanthus Lobbianus I noticed growing and flowering freely in a hanging basket, and a beautiful object it was.

I must not forget the fruit in admiring the flowers. Vines and Peaches looked remarkably well, notwithstanding that a thoughtless act on the part of an assistant had somewhat seared the foliage of the latter. They must have a congenial root medium, for they grow with extraordinary luxuriance, in spite of the lifting that has been repeatedly practised. Grosse Mignonne carried a grand crop of very fine fruit, two trees giving twenty-two dozen. I was much struck with the exceptional colour in Lord Napier Nectarine. All the varieties colour highly, but his lordship was deeply suffused almost all over his countenance with a rich and ruddy glow, quite drowning his usual speckled appearance. The Grapes are excellent, and some canes of Buckland Sweetwater and Foster's Seedling, four years old, have made unusual progress. They are evidently in good soil and well managed.

The outdoor fruit is a wonderfully heavy crop, and it was sad, in one sense, to see quantities falling from the drought. One of the best Apples in a somewhat large collection is Harvey's Wiltshire Defiance, a conical fruit with prominent ribs, and taking on a rich colour. It is a constant cropper, a good keeper, and possesses excellent quality. There

are also some model trees of Bramley's Seedling, planted by Mr. Jenks when the variety was first sent out, I believe. He was bold enough to plant a good many, and they have amply vindicated his judgment. It is admitted to be one of the best Apples grown in the neighbourhood. D. T. Fish and Warner's King, often classed as synonymous, are distinct enough at Brambletye, and particularly so in the foliage. The former has small, light-coloured leaves, the latter much larger and darker ones. The difference between them in this respect is not so minute as to require a long study with a microscope to discover, but is clear and palpable enough at a glance. Early Rivers Plum was breaking down its branches with fruit, bearing, not wisely, but too well. Some people are fond of saying that this wonderful Plum has made a handsome slice in a goodly fortune for Mr. Rivers; that I know nothing about, and it is a private matter into which it is not seemly to inquire. But of this I feel satisfied, whether it has filled his pockets or not, it has those of more than one market grower, though they are not too fond of admitting anything about the pocket-filling, only the emptying.

One more hint picked up at Brambletye, and that is concerning the great usefulness in a season like the present of New Zealand Spinach. Sown in heat in April and planted out on mounds in a frame, minus lights at the time of my visit, it had been picked from all the summer, and would assuredly give dishes until the frost came, a period of something like six months let us say. It grows luxuriously and continuously, and though I am not going to say it would be as acceptable in the dining room as tender and delicate Peas, it is not despised in a season when Peas and Beans are excessively scarce.

From what I saw at Brambletye it is a place well done and worth visiting. I congratulate Mr. Glen on his good work, and wander through a rock-lined path, and across the fields to Plaw Hatch, the residence of Mrs. Arbuthnot, and the gardens of which are in charge of Mr. Draper. That wise and witty gardener has much to talk about and much to show you. What a conversationalist he is to be sure! And what a garden he has under his charge! Surely there never was such a mixture. I am overwhelmed by it. Descriptive powers of an ordinary type are of no avail in dealing with Plaw Hatch. Mr. Draper is too much for me.—W. P. W.

BLACK HAMBURGH GRAPES OUTDOORS.

I SEND you a box containing one bunch of Black Hamburgh Grapes grown and ripened entirely out of doors without any artificial aid on the south wall of my house. The season is, of course, exceptional, but I have ripened them thoroughly the three past seasons, though always

later in the year.

The wall, as is the case in many houses in these south-western counties, is slated to keep out the driving winds, and this no doubt helps in the result, and there is a kitchen chimney inside; but there must be hundreds of houses equally favourably situated (for this is very much exposed to winds and gets no shelter) which might well produce similar results. I have about fifty bunches larger and smaller this year, the Vine having been planted four years ago. There was a fine bloom on the Grapes when packed, but I fear they will suffer in transit.—
J. R. Dummelow, Membury Parsonage, Chard.

[The bunch of Grapes was of medium size, the berries being fine and well coloured.]

SUMMER LETTUCES.

The difficulty of maintaining a supply of Lettuces this summer has been a common cause of complaint. Those having a poor soil to deal with have no doubt experienced a Lettuce famine to a certain extent. Daniel's Continuity, a variety spoken favourably of by your correspondent "W. K. W." recently, has been very useful here on account of its long standing before running to seed. Its colour, too, causes it to be looked upon by those unacquainted with it as somewhat of a novelty, making an agreeable change with the lighter green of Cos and Cabbage varieties. Hammersmith, one of the most reliable for winter work, "bolted" every plant under the tropical sun we have lately experienced, though sown and planted alongside Veitch's Perfect Gem and other popular sorts. Sutton's Intermediate is a good Lettuce. As its name implies, it is intermediate in appearance and character between the Cabbage and Cos varieties. It has the dark leaves of the Bath Cos, with the dwarf growth and compact head of the Cabbage. Those who object to the soft leaf of the latter section would find in this an intermediate crispness between the two, and for this reason I am inclined to the belief that it will become popular. It has been the favourite of all the sorts grown in these gardens this summer. The Celery ridge usually furnish the finest Lettuce of the season, but it has not done so in our case this year; the best we have had was from firm undug ground on which Strawberries were planted late last autumn in one instance, and another in which a crop of Broccoli was grown last year, and the ground left undug for planting the same crop again this summer.

The Lettuce seeds were sown in the intermediary spaces in the spring, and the Broccoli plants put out in their places when they were ready before the Lettuces were cleared off. We were cutting some very fine heads from this firm ground when in many gardens they refused to grow at all, consequent on the severe drought. Veitch's Perfect Gem has done splendidly, and is a valuable and distinct summer variety, and from what I saw of it last spring in a neighbour's garden I should say it is a good winter sort too.—W. STRUGNELL, Rood Ashton Gardens.

LILIUM HENRYI.

ALTHOUGH this beautiful Lilium has been grown at the Royal Gardens, Kew, for the past three or four years, it has not yet found its way into many private establishments. Being now in commerce, however, it will no doubt be quickly distributed, for the distinctiveness of the flower will render the species popular. It is a charming Lily, and is said to have been discovered in 1888 near Ichang in the Hupeh Province of Western China by Dr. A. Henry, a missionary in that locality. Mr. Ford, Hong Kong Botanical Gardens, sent bulbs of it to Kew, and these flowered in August, 1889. Bulbs have been planted out at Kew, and they are now flowering profusely, the spikes varying from 4 to 6 feet or more in height, and carrying upwards of a dozen flowers each.

As will be seen by the illustration (fig 28), which has been prepared from a bloom kindly supplied by Mr. T. S. Ware, Hale Farm Nursery, Tottenham, the flower resembles that of L. lancifolium in shape, but differs considerably in colour, being of a rich orange yellow shade marked with crimson. It is a vigorous growing species, and is now

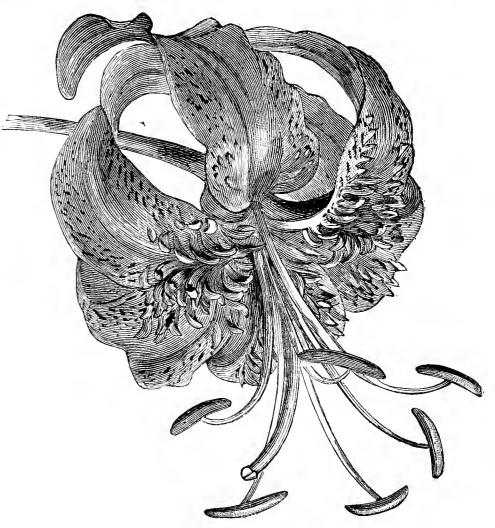

FIG. 28.—LILIUM HENRYI.

flowering freely in Mr. Ware's nursery, where, we believe, it has proved quite hardy. By referring to the report of the Exhibition held under the auspices of the Royal Horticultural Society at the Agricultural Hall this week, it will be seen that a first-class certificate has been awarded for this grand Lilium.

ROYAL HORTICULTURAL SOCIETY.

GREAT SHOW AT THE AGRICULTURAL HALL.

AUGUST 29TH, 30TH, 31ST, AND SEPT. 1ST.

The frequent references to the great Exhibition of the Royal Horticultural Society at Islington have proved the interest which the event has excited in the floral world. It has been approved and condemned, voted too long, and fixed for the wrong place, and in other ways criticised, but withal it has taken hold of people's attention. We do not know particulars of the arrangement which the two Societies have made in connection with the Show, but at least it must be admitted that the R.H.S. has done its share of the work well, for a great and varied Exhibition has been arranged which merits the support of the public. There was a magnificent display of fruit, perhaps the best which has been got together in London of recent years, and that in itself should prove a great attraction. The leading growers, both amateur and professional, have acquitted themselves nobly, and when such leading cultivators as Messrs. Bunyard, Cheal, Paul, Rivers, Veitch, Woodward,

and others are doing their best the display is no mediocre one. Then there was a wonderful display of cut flowers-one of the finest ever seen-Roses, Gladioli, and Dahlias being the three chief features, and most of the leading growers were represented by them. Groups of plants made grand banks in the centre of the Great Hall, but imposing though they were it is doubtful if these are not relatively the least striking feature of the Exhibition. They were dwarfed by the great altitude of the building, but had they been a little elevated a superb effect would have been produced.

There was only a small attendance in the early portion of the opening day, but we hope to be able to record in due course a success as great from the financial as it undoubtedly is from an artistic point of view. While it is a pleasure to note so much that is good, we must not overlook one or two oversights, especially as we are authoritatively informed that the Council enjoy fair criticism. One mistake—we will call it a printer's-fixed the time for judging at one o'clock, whereas it ought to have been finished then, and it naturally caused delay and confusion in staging. The 1 o'clock was no doubt intended for 11 o'clock, so firstly by the misplacement of a comma (referred to in another place), and then the omission of a "1," a check was experienced, but all went smoothly in the end. The second oversight was in omitting to send reporters' tickets, at least to this office, and we wonder how the authorities thought our three reporters could pass the closely guarded barriers to let the world have a record of this, the last and best work up to date of the R.H.S. However, reporters are proverbially men of resource, and the following is the result of their endeavours. The luncheon, however, beat them, though the scribes belonging to ordinary (not horticultural) newspapers found admittance to the tables. Perhaps the Agricultural Hall Company were responsible for the ticket arrangements, and they were not like the Show itself—a success.

A detachment from the Fruit Committee, headed by Dr. Hogg, was told off to inspect the large contributions arranged in the body of the hall, such as those of Messrs. Bunyard, Cheal, Rivers, Veitch, and others, and splendid they were, a reserve being arranged for the table for the examination of new products under the superintendence of the genial Chairman, Mr. Phillip Crowley. The table men, in addition to the Chairman, were, so far as can be remembered, Messrs. T. F. Rivers, Chairman, were, so far as can be remembered, Messrs. T. F. Rivers, F. Q. Lane, J. Hudson, J. Cheal, G. Reynolds, A. J. Laing, A. Young, and J. Wright. The flying contingent, besides the Doctor, were Messrs. Taber, H. J. Pearson, H. Balderson, G. W. Cummins, A. Dean, and W. H. Divers, and both divisions had plenty to do. The first products placed on the table were from Mr. Owen Thomas, from the Royal Gardens, Frogmore, who sent a white Melon raised from Frogmore Seedling and High Cross Hybrid. The seedling was handsome, juicy, and refreshing, but wanting in flavour. Another Melon from Frogmore and refreshing, but wanting in flavour. Another Melon from Frogmore named Cambrian was similar in character, but with a distinct aroma. Several fine fruits of Frogmore Seedling were sent by Mr. Thomas, and a vote of thanks was awarded. Mr. Llewellyn Hughes sent a dish of splendid fruits of Lord Suffield Apple grown in a small back garden in populous Islington, far superior to fruits that were grown in the country twenty years ago. We are advancing, and a cultural commendation was awarded to Mr. Hughes. A new Melon was sent by E. Hart, Esq., Fairlawn, Totteridge, Herts (gardener, Mr. J. Smith). It is a closely netted fruit raised from Countess and Syon House; good, but not quite good enough for a certificate. Mr. E. Gilman, gardener to the Earl of Shrewsbury, sent six Melons—Pride of Ingestrie, the result of a cross between Coleton Bassett and Syon House; fruits handsome a cross between Colston Bassett and Syon House; fruits handsome, juicy, sweet, and refreshing, but not equal to existing varieties, and no award was made.

Mr. W. H. Divers sent a seedling Peach Late Crimson, raised from Byron Nectarine, fruit fine and very heavy, said to ripen after Sea Eagle. Mr. Divers was requested to send six fruits another year, and so comply with the conditions, which he was unable to do on the present occasion. Messrs. R. Veitch & Son sent from Exeter fruits of the Late Devonian Peach, the result of a cross between Belle de Vitry and Late Admirable. They were sent to show the high colour of the variety, and ripe samples are expected to be sent to a subsequent meeting. Mr. Miller, gardener to Lord Foley, Ruxley Lodge, Esher, sent fine fruits of Barrington and

Chancellor Peaches, but they were not ripe (vote of thanks).

Mr. John Allsop, The Gardens, Dalton Hall, Hull, sent a dish of Tomatoes Allsop's Elected. A splendid cluster was exhibited, and handsome individual fruits. Recommended to be tried at Chiswick. Messrs. James Carter & Co. sent dishes of the Duke of York Tomato, very fine fruits. A beautiful dish of Blenheim Orange was also sent by Messrs. Carter, and a vote of thanks accorded. Messrs. Collins Brothers sent a plant of the Challenger Tomato bearing fine fruits. Vote of thanks, the variety having been previously certificated. Mr. Joseph Fitt, The Gardens, Malshanger Park, sent two fine clusters of the Lady's Finger Banana, and a cultural commendation was awarded.

Mr. J. Hudson sent from Gunnersbury House neat bunches of Lady Hutt (round white), and Appley Towers (black) cut from Vines grown on the Muscat of Alexandria; also Gros Maroc from a Foster's Seedling stock for representing improvement in flavour; but as no fruit from a Vine on its own roots was sent for comparison, no opinion was expressed, but a vote of thanks awarded. Mr. Francis Calver, Ludlow, sent a dish of smal wellow dessert Apples, ripe, tender, of fair quality and useful

as ripening at the present season. The variety was not named (vote of thanks).

A seedling Potato, George Dickson, was sent by Mr. H. Mackerbeth, Ulverstone; tubers round, roughly skinned, and of excellent shape; recommended to be grown at Chiswick, as the produce was much admired. A similar recommendation was made in respect to a new Kidney Potato, named Barton Court Perfection, the result of a cross between Magnum Bonum and Snowdrop; beautiful shaped tubers, sent by Mr. Wm. Young, Barton Court Gardens, Kintbury.

Mr. William Trotter, gardener to F. Ricardo, Esq., Bromeberrow Place, Ledbury, sent two cases of fruit, grown and dried at Bromeberrow. Apples and Plums in different varieties were represented, also Peas and Kidney Beans. The samples were so good and suggestive that a silver medal was unanimously recommended. Mr. J. Clarke, Albion Nursery, Farnham, sent upwards of thirty bunches of Grapes in seven varieties, grown without fire heat, not large but good and well finished, and a

small silver medal was recommended for them.

Dr. P. H. Emerson, Claringbold, Broadstairs, Kent, sent an unusual and interesting collection of fruits and vegetables grown in the open air, comprising Sweet Potatoes (Convolvulus Batatas), Ohio Squash, Brazilian Gourd, Yokohama Squash, fine English Codlin Apples (grown on the Quince stock), English Codlin, Skirret, Hamburgh Turnip-rooted Parsley, Beurré Hardy Pears, Sweet Mountain Peppers, Spanish Mammoth Pepper, Monstrous Pepper, Egg Plant (Early Dwarf and Long Purple), Sandwich Island Salsify, Lima Bean, Ground Nuts (Arachis hypogæa), Pe. Tsai (Brassica sinensis var.). A bronze medal was unanimously recommended, and the Chinese Cabbage, which is said to be very hardy, and somewhat like Spinach when cooked, but more mucilaginous, requested to be grown at Chiswick.

The preceding exhibits were examined at the Committee table; the following arranged in the body of the hall, and here, it must be said, that the display of fruit by the leading nurserymen was magnificent, trees in pots bearing splendid dishes, forming an appropriate and effective background to the dishes and baskets in front.

Messrs. T. F. Rivers & Son had splendid Peach and Pear trees in pots bearing fruit of the first size and tempting in quality. The prominent Peaches, Sea Eagle, Albatross, Princess of Wales, Osprey, and unnamed seedlings were all very fine, as were the Pears Labrun, Louise Bonne of Jersey, Souvenir du Congrès, Conference, and Marie Louise d'Uccle. The valuable Monarch Plum was represented by heavily laden trees in pots and splendid fruit in boxes—a Plum with a future, as ripening when the "glut" is over. Figs in pots were well shown, and what may be termed a hedge of fruiting Vines had an imposing effect. A gold medal was recommended for this splendid collection.

Messrs. Cheal & Sons had heavily laden Apples and Pears in pots, the fruit being fine and admirably coloured. Two years old Bismarck Apples were laden with fruit; still finer were many of the specimens shown in baskets and dishes, all the leading varieties being admirably represented, such as Alexander, Gascoigne's Seedling, Frogmore Prolific, Bismarck, Worcester Pearmain, Lady Sudeley, Flower of Kent, Mère de Ménage, Cellini, The Queen, and others, all speckless and in beautiful colour. Pears were also excellently represented (silver-gilt Knightian medal). Messrs. James Veitch & Sons had an extensive and imposing display of Apples, Pears, and Plums, with a central group of Figs and Peaches in pots. Some of the finest Apples were Seaton House, Winter Hawthornden, Peasgood's Nonesuch, Frogmore Prolific, Stirling Castle, Gascoigne's Seedling. Of Plums, Grand Duke, Autumn Compôte, Belle de Septembre, Monarch, Coe's Golden Drop, Late Transparent Gage, Bryanston Gage, and Decaisne, attracted attention by their size and colour. Raspberries and Cherries were also included in this fine collection (silver-gilt Knightian medal).

Messrs. G. Bunyard & Co. had a splendid exhibit of fruit and fruit trees, its interest lying as much in its great diversity as in its quality. There were trained trees of nearly all kinds, such as espaliers ready for furnishing fences or walls, cordons, fans, pyramids, amateurs' standards fruiting up the stem and forming good heads, the kinds represented in fruit being Peaches and Nectarines, Apples, Pears, Grapes, Plums, and Figs. Such an exhibit as this must be full of interest to the public and not without instruction. There were about sixty trees in all. The Maidstone firm also had a splendid display of gathered fruit, comprising about 120 dishes, thirty-six baskets, of gathered fruit, comprising about 120 disnes, thirty-six baskets, and seven stands (Grapes). Amongst the finest of the Apples were Duchess of Oldenburg, Lord Suffield, Annie Elizabeth, Cellini, Lord Grosvenor, Potts' Seedling, Stone's, Lady Sudeley, The Queen, Worcester Pearmain, Stirling Castle, and Grenadier. Pears—Dr. Jules Guyot, and Williams' Bon Chrêtien. Plums—Cox's Emperor, and Monarch. The Nuts are also worthy of mention. The Prolific Filbert was shown in large clusters quite ripe, and a large and splendid variety likely to become very popular is Bergere. About fourteen variety likely to become very popular is Bergere. About fourteen varieties of Strawberries were shown, some in planting pots and others

potted off (silver gilt Knightian medal, and it ought to be a large one).

Messrs. W. Paul & Son, Waltham Cross, had a large display of Apples, Pears and Plums, the produce being of their usual high quality. They also had some splendid trees in pots (silver-gilt Knightian).

The English Fruit and Rose Company (Cranston's) sent 100 dishes of Apples, large in size and well coloured, some of the best being Seigende Reinette, Lord Suffield, Tom Putt, Lord Grosvenor, King of the Pippins, and Potts' Seedling. Mr. Bythway had forty-five dishes of Apples and two baskets, some of his varieties being very good indeed, notably Bramley's Seedling, Tom Putt, Tower of Glamis, Mère de Ménage, The Queen, and Ribston (silver Knightian). Messrs. Spooner

and Sons had ninety-five dishes and baskets, but they were in two parts, otherwise would have looked more effective. The fruit was not noteworthy for size, but was clear, and well coloured (silver Knightian). Messrs. J. Peed & Sons sent fifty dishes of well-coloured Apples and Pears (silver Knightian).

Competitive Classes.—The misplacement of a comma caused some to wonder what was wanted in the first of the fruit classes. The schedulc read, "Twelve distinct kinds, black and white Grapes, admissible." This was thought to refer to twelve kinds of Grapes, black and white, but a very little reflection should have sufficed to show that twelve kinds of fruit, black and white Grapes admissible, was meant. There was some delay in judging this, so we may take the second class first. This was for six distinct kinds, black and white Grapes admissible, as before. Mr. Ocock won with Muscat of Alexandria and Alicante, Elruge Nectarine, Cox's Golden Gem Melon, Osprey Peach, and Williams' Bon Chrêtien Pear, altogether a very good display. Mr. Masterson was a good second, but weakened by moderate black Grapes, and Mr. Wallis third.

Mr. McIndoe, gardener to Sir J. W. Pease, Bart., M.P., Hutton Hall, Guisboro', was the only exhibitor of twelve kinds, and it was hardly up to his best condition. He had fair Gros Guillaume and Buckland Sweetwater Grapes, Negro Largo Figs, Moorpark Apricots, Pineapple Nectarines. Exquisite Peaches, Beurré d'Amanlis Pears, Magnum Bonum Melon, Jefferson's Plums, Ribston Pippin Apple, Morello Cherries, and a

fair Pine. The second prize was awarded.

Grapes were excellently but not extensively shown. The first of the classes was for three bunches of Muscat of Alexandria, the principal prize being a silver cup presented by the Turner Memorial Trustees. This was secured by Mr. Reynolds, gardener to the Messrs. de Rothschild, Gunnersbury Park, Acton, with large and splendidly coloured clusters. Mr. Winter, gardener to W. Maw, Esq., Walk House, Barrow-on-Humber, was second with bunches of a very similar character, but a trifle smaller; while Messrs. Tidy of Stanmore, and Jordon of Holdenby House Gardens, were equal third. There were three other stands. A similar prize was offered for Black Hamburgh, and this cup was carried off by Mr. Elphinstone, gardener to E. M. Mundy, Esq., Shipley Hall, Derby, whose bunches were very fine in berry and splendidly coloured. Mr. Reynolds was second, his berries being smaller than those of Mr. Elphinstone; and Mr. Messenger was third. Three others competed. Mr. Reynolds had the best three bunches of any other white, Buckland Sweetwater, perfectly coloured and fine in berry, securing him the first prize. Mr. Osman, gardener to L. J. Baker, Esq., Ottershaw Park, Chertsey, was second with Mrs. Pearson. Mr. S. T. Wright, gardener to C. Lee Campbell, Esq., Glewston Court, Ross, had some magnificent 6-lb. bunches of Alicante in the class for any other black Grapes, and won somewhat easily; but Mr. Howe, gardener to H. Tate, Esq., Park Hill, Streatham, showed the same variety very finely, and was a most creditable second; Mr. Reynolds being third with good Gros Maroc.

There was one other class for Grapes, this calling for sixteen bunches in eight varieties, and some splendid fruit was staged in it. Mr. Reynolds had a grand collection, his bunches being well coloured throughout, and the berries very fine. He had Chasselas Napoleon, Madresfield Court, Muscat of Alexandria, Black Hamburgh, enormous bunches of Trebbiano, Alicante, Mrs. Pearson, and Gros Maroc. Taken in conjunction with his other successes, Mr. Reynolds may be said to have scored a Grape triumph. Another splendid contribution came from Mr. Bury, gardener to C. Bayer, Esq., Tewkesbury Lodge, Forest Hill, who had Alicante, Muscat of Alexandria, Gros Guillaume, and Gros Maroc in very fine condition, but Trebbiano was not nearly so good as Mr. Reynolds's. Mr. Wallis was third, his Golden Queen being

the best

Some splendid Peaches were shown in the class for four dishes, six fruits to each. Mr. Divers, gardener to J. T. Hopwood, Esq., Ketton Hall, Stamford, won with magnificent fruit of Princess of Wales, Barrington, Prince of Wales, and Sea Eagle. They were of great size and splendidly coloured. Mr. Woodward, Barham Court Gardens, Maidstone, followed, also having beautiful examples. Mr. McIndoe was third, and an extra prize was deservedly awarded to Mr. Wallis, gardener to R. Sneyd, Esq., Keele Hall, Newcastle, Staffs. Mr. Tidy gardener to W. R. D'Arcy, Esq., Stanmore, was first with two dishes, Sea Eagle and Late Admirable representing him. Mr. Ocock, gardener to Mrs. McIntosh, Havering Park, Romford, was second; and Mr. Elphinstone, Henley Park, Surrey, third. Mr. McIndoe won with four dishes of Nectarines, his varieties being Byron, Humboldt, Pineapple, and Spenser, small, but beautifully coloured. Mr. Woodward was second, and there was another competitor, Mr. Potter, St. Clere Gardens, Kemsing, who was perhaps third, but his card was not marked. Mr. Divers appeared to be the only exhibitor of two dishes, and was awarded the first prize for Spenser and Pineapple in excellent order.

Divers appeared to be the only exhibitor of two dishes, and was awarded the first prize for Spenser and Pineapple in excellent order.

Mr. Ocock had the best pair of Melons, staging very fine fruits of Countess and a white-fleshed seedling. Mr. Messenger was a good second, and Mr. Masterson, gardener to the Marchioness of Camperdown, Weston House, Shipston-on-Stour, third. With four dishes of Plums Mr. McIndoe was to the front, winning with excellent dishes of white Magnum Bonum, Prince Englebert, Jefferson, and Lawson's Golden Gage. Mr. Turton, gardener to J. Hargreaves, Esq., Maiden Erlegh, was second, and Mr. Messenger, Woolverstone Park Gardens, Ipswich, third. Mr. McIndoe was easily first with a collection of Plums.

Apples were extremely good. There were nine collections of six dishes, and of these the best was a wonderful half dozen from Mr. Woodward, which easily accounted for the first prize. The varieties were Peasgood's Nonesuch, Emperor Alexander, New Hawthornden,

Warner's King, Lord Suffield, and Washington, all being of enormous size, clean, and finely coloured. Mr. G. Chambers, Beech Farm, Mereworth, Maidstone, was seeond, his Cox's Pomona being full of colour, and the other varieties were very good. Mr. Turton, Maiden Erleigh, Reading, and Mr. Prinsep, gardener to Viscountess Folkestone, Buxted Park, Sussex, were equal third. Three dishes of Pears were asked for, and with these Mr. Gibson, gardener to Earl Cowley, Draycott House, Chippenham, was victorious, his varieties being Beurré Clairgeau, Duchesse d'Angoulême, and Pitmaston Duchess of great size. Mr. Woodward was second. Messrs. Masterson and another, whose card was unmarked, equal third.

Mr. Watkins' prizes for a collection of hardy fruit was carried off by Messrs. Woodward and McIndoe, both having excellent displays. The former's first-prize stand was strengthened by some very good Peaches, which were lacking in the Yorkshire grower's collection. He also had some splendid Apples, Pears, and Plums. Mr. McIndoe had Apples, Pears, Cherries, Plums, Gooseberries, Apricots, Nuts, and Red Currants

-a good and varied exhibit.

The first prize for a collection of Apples went to Messrs. Bunyard and Sons, who had a large and very varied collection of high-class fruit, the produce being large, clean, and well coloured, speaking volumes for the Maidstone soil, air, and culture. The English Fruit and Rose Company were second in this class. Mr. Woodward secured the first of Messrs. Bunyard & Co.'s prizes for three dishes of dessert Apples with Ribston, Washington, and Lady Sudeley, beautifully coloured, and the first for three dishes of culinary varieties with Peasgood's Nonesuch, Stone's and Warner's King, the minor awards going to Messrs. Chambers and Turton.

Messrs. Bunyard & Co. appeared to be the only exhibitors of orchard house trees, and were awarded the first prize for healthy, well-trained specimens, carrying excellent fruit. Mr. McIndoe won with orchard grown fruit, Mr. Potter being second, and Mr. Nicholson, gardener to

J. W. Melles, Esq.. Sewardstone Lodge, Chingford, third.

VEGETABLES.

There were nine vegetable classes, the first of them being for a collection of twelve distinct kinds arranged in baskets or "rounds," the first prize being the Turner Memorial cup, value £5. Mr. Waite, gardener to Colonel Talbot, Glenhurst, Esher, won with some grand produce. His imposing basket was made up of Carter's Autumn Mammoth Cauliflower, Satisfaction Potato, Globe Artichokes, Silver Ball Turnip, Intermediate Carrot, Glenhurst Favourite Tomato, Ailsa Craig Onion, Veitch's Early Rose Celery, Pragnell's Beet, Student Parsnip, Ne Plus Ultra Runners, and Dobbie's Champion Leeks. Mr. Wilkins, gardener to Lady Theodore Guest, Inwood House, Henstridge, was second also with grand produce, his Ailsa Craig Onions and Intermediate Carrot being particularly fine. Mr. Watson third. Only one competed with six kinds, namely Mr. Payne, gardener to W. A. South, Esq., Neasdon, and the first prize was awarded to him, a generous decision. The first of Messrs. Carter's prizes went to Mr. Waite for a very fine basket of the Holborn firm's excellent specialities, and the second to Mr. Payne. Mr. Chopping, Periwinkle Mills, Sittingbourne, was first for Messrs. Carter's prize for Potatoes, showing six: excellent dishes. This amateur is an admirable grower of Potatoes. Mr. Waite was second. Mr. Chopping also won the Turner Mem rial cup for twelve dishes of Potatoes, exhibiting some magnificent tubers. Mr. Waite was second, and Mr. W. Young, Barton Court Gardens, Kintbury was third. Messrs. Cannell & Sons and Mr. Wilkins had very fine collections of Onions not for competition, for which silver mcdals were recommended.

Mr. Waite won with Salads, and was second with Onions, being defeated in this class by Mr. Wilkins, whose produce was larger but less handsome than Mr. Waite's. Mr. Wilkins had Lord Keeper and Mr. Waite Ailsa Craig. Mr. Howe won with three dishes of Tomatoes, having very good dishes of Lady Bird, Silver's Invincible, and Perfection. Mr. Ryder was second, and Mr. Tidy third. Messrs. Dobbie & Co. offered prizes for their fine Leek Champion, and some splendid produce was shown. Mr. D. Gibson, gardener to C. R. Dubs, Esq., was first, Mr. R. Watson second, and Mr. J. Findlay third. Messrs. Dobbie exhibited some grand specimens of the Leek themselves, and also of their other specialities. Messrs. Carter & Co. exhibited a large and handsome Tomato named Duke of York, also their well-known Blenheim Orange.

PLANTS AND CUT FLOWERS.

This section comprised the bulk of the exhibits, and the following members of the Floral Committee made the awards in the miscellaneous division. Messrs. G. Paul, C. T. Druery, T. D. Pawle, W. H. Williams, C. E. Pearson, R. Owen, C. Jeffries, W. Bain, G. Stevens, R. Dean, J. H. Fitt, Thomas Godfrey, R. B. Lowe, C. J. Salter, J. Jennings,

H. Turner and Frank Ross.

Messrs. E. D. Shuttleworth & Co., Albert Nurseries, Peckham Rye, and Fleet, Hants, had a large group of miscellaneous plants, arranged in an effective manner. The background was composed of large Palms, and the front portion being principally Crotons, Dracænas, Coleus, Maidenhair Ferns, Conifers of various kinds, and Liliums (silver-gilt Flora medal). Messrs. W. Cutbush & Son, Highgate Nurseries, N., also contributed a group of ornamental foliage and flowering plants, including large Palms, Liliums, Dracænas, Carnations, Bouvardias, Dracænas, and Crotons, the whole being put together in a charming manner (silver Flora medal). Mr. C. Turner, Royal Nurseries, Slough, staged a splendid group of Liliums and Hydrangeas, amongst which were a few Palms. This group made an imposing appearance, and was much admired by visitors (silver Banksian medal). A solid-looking

mound of Pompon Dahlias, tuberous Begonias, Adiantums, and Zonal Pelargoniums was arranged by Mr. H. J. Jones, Rycroft Nursery, Lewisham. Amongst the Zonal Pelargoniums the "nearest blue" variety, Mrs. W. Wright, was most conspicuous. This is a showy Zonal with large trusses of bloom (silver Flora medal). Mr. J. Hudson, gardener to Messrs. de Rothschild, Gunnersbury House, Acton, exhibited in this section, as well as in the competitive classes, a number of trained scented-leaved Pelargoniums. Two plants of the old Radula, trained like a fan, were most attractive, and some standard Aloysia citriodora commanded attention (silver Flora medal). A large collection of exotic and native Ferns from Messrs. W. & J. Birkenhead, Sale, Manchester, formed quite a feature in the Show, there being most of the leading and choice varieties represented. Conspicuous amongst others in this contribution were the beautiful Athyrium f.-f. kalothrix, Adiantum Hodgkinsoni, Davallia fijiensis elegans, Lygodium dichotomum, Adiantum tenerum roseum, Microlepia hirta cristata, Pteris nobile, and Polystichum acrostichoides lobatum, the last-named being a new hardy Fern (silver Flora medal).

Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, arranged a large oval-shaped group of foliage plants in the centre of the hall. Amongst others in this collection were splendid Tree Ferns and Palms 12 or 15 feet in height, Alocasias, Dracænas, ornamental foliage Begonias, and some fine specimens of the variegated Indiarubber Plant (Ficus elastica variegata). A few plants of Nepenthes and Orchids in flower were placed on pedestals, these adding variety and attractiveness to the group (silver-gilt Flora medal). Messrs. H. Cannell & Son had, amongst other things, a choice collection of Cacti and succulent plants, amongst which the Prickly Pear (Opuntia monocantha) was in fruit, Agave Victoria Regina, Echinocactus in variety, and numerous others. Blooms of Cactus Dahlias were shown with the plants referred to (silver Banksian medal). Blooms of Cactus A remarkably fine group of Palms of huge size, interspersed with Tuberoses, Dracenas, Crotons, and Ferns was arranged by Mr. P. McArthur, 4, Maida Vale. A plant of Cypripedium Harrisonium superbum was noticeable in this contribution, one of the flowers being exceptionally fine. Other Orchids, including Oncidium crispum and Catasetum macrocarpum were also conspicuous in the group (silver Flora medal). Mr. A. Waterer, Knap Hill, Woking, had specimens of the Colorado Blue Spruce (Picea pungens argentea), and one of P. p. glauca, both varieties being very showy (bronze Banksian medal). Messrs. Hurst & Son, 152, Houndsditch, London, sent half a dozen plants of a new crested Golden Feather under the name of Pyrethrum aureum cristatum, but no special award was made. W. B. Kellock, Esq., Stamford Hill, sent two seedling Agaves named A. Leopold II. and A. univittata marginata, for which first-class certificates were awarded. The plants are described elsewhere.

Messrs. J. Veitch & Sons, Royal Exotic Nursery, sent a basket of Cornus brachypoda variegata, for which a first-class certificate has been awarded. This is described below. A certificate was also adjudged for Clerodendron trichotomum, which was likewise shown by Messrs. Veitch. From Mr. Anthony Waterer came, in addition to the Piceas already mentioned, a box of blooms of Spiræa Anthony Waterer, and Weigela Eva Rathke, a late flowering variety, for which a first-class certificate was awarded. Sir Trevor Lawrence, Bart., secured an award of merit for Pentstemon Clevelandi, which is described elsewhere, and a first-class certificate for a plant of Exacum macranthum, which was figured in the Journal for Dec. 22nd, 1892. The Rev. W. Wilks, Shirley Vicarage, gained an award of merit for Helianthus rigidus Miss Mellish, which is described elsewhere. Messrs, J. Peed & Sons, Roupell Park Nurseries, sent a small group of Caladiums and some plants of the recently introduced Strobilanthes Dyeriana (silver Banksian medal). Messrs. Wallace and Co., St. John Street, Colchester, had a number of new Liliums, including L. Henryi, for which a first-class certificate was awarded. This species is described and illustrated on page 191 of this issue. Messrs. G. Paul & Sons, The Old Nurseries, Cheshunt, had a large group of Bamboos in tubs, and some dwarf Cannas, for which a silver Flora medal was recommended. Messrs. W. Barron & Sons, Elvaston Nursery, Borrowash, Derby, had a large collection of foliage from ornamental and deciduous trees (bronze Banksian medal).

Messrs. E. D. Shuttleworth & Co., Albert Nurseries, Peckham Rye, arranged a handsome group of hardy flowers and shrubs. Amongst the most noticeable flowers in this stand were Gladioli, Liliums, Calliopsis lanceolata, Phlox Attraction, Helianthus grandiplenus, Helenium autumnale, Asters (Michaelmas Daisies), and a bright collection of show, fancy, and Cactus Dahlias (bronze Banksian medal). A very beautiful collection of Gladioli was staged by Messrs. Kelway & Son, Langport, Somerset, the best of which are Boston, Herkomer, Myers, Ouless, Mills, Ellis, Sir S. Northcote, Fiducia, Mrs. Langtry, Maid of Orleans, Marquis of Exeter, Ovide, and Mary Anderson. Gaillardias were also very bright and showy, the best being Magenta King, Jas. Kelway, Avalla, and Raphael. The same firm also have a box of Dahlia serratifolia Duke of York, Pompon Dahlias Darkness, Guiding Star, Dandy, A. F. Barron, Fashion, G. Brinckman, and Royalty. Asters were also shown, and a varied collection of herbaceous flowers, including Eryngium planum. Pyrethrums, Solidago altissima. Cannas. and Eryngium planum, Pyrethrums, Solidago altissima, Cannas, and Michaelmas Daisies (silver Banksian medal). A arrey beautiful collection of hardy flowers was staged by Messrs. Barr & Son, King Street. Covent Garden, including Lilium lancifolium, Helianthus, Pentstemons, Gladioli, Calliopsis, Phloxes, Colchicum byzantium, C. varegatum, Violas, and summer flowering Chrysanthemums (silver Banksian medal). A collection of hardy flowers and Dahlias was shown by

Messrs. Cutbush & Son, Highgate, in which Gladioli, Hyacinthus candicans, Tritoma Uvaria, Gaillardias, Liliums, Dahlias (Pompon and Cactus, Lobelia cardinalis, Calliopsis lanceolata grandiflora (exceptionally good), Anemone japonica alba were most noticeable (silver Banksian medal). Roses were grandly shown by Messrs. Wm. Paul & Son, Waltham Cross. Particularly good were Duke of York, White Lady, Lorna Doone, Corinna, Pride of Waltham, Spenser, Grace Darling, Souvenir de la Malmaison, Marie Rady, L'Idéal, Comte Henri Reignon, Madame Lausette de Messimy, Madame Victor Verdier, Wm. Allen Richardson, Mrs. John Laing, Polyantha Roses, Madame Pierre Cochet, a reddish W. A. Richardson, Marie Van Houtte, Madame Hoste, La France, Souvenir d'Auguste Legros, Ernest Metz, Général Jacqueminot. France, Souvenir d'Auguste Legros, Ernest Metz, Général Jacqueminot, Ella Gordon, Homer, and Madame Alfred de Rougemont (silver Flora medal). Mr. Reynolds, gardener to the Messrs. Rothschild, Gunnersbury Park, Acton, staged a box of Carnation Mrs. Leopold de Rothschild, for which he received an award of merit (see below). Messrs. Dobbie & Co., Rothesay, had a very large collection of Dahlias of various types, Asters, and Marigolds, the latter being very fine. A silver gilt Flora medal was recommended. Mr. Eric F. Such, Maidenhead, had a collection of Show and Fancy Dahlias (bronze Banksian medal). Mr. B. Ladhams, Southampton, arranged a group of Ernest Ladhams perpetual flowering Pink, for which he has received an award of merit.

There was only a light display of Orchids, and the following members of the Orchid Committee were present to judge the exhibits:—Sir Trevor Lawrence, Bart. (Chairman), Jas. O'Brien, T. Statter, E. Hill, F. Sander, H. M. Pollett, H. J. Veitch, H. Ballantine, and Dr. Masters. A beautiful table was made up of the combined contributions of Messrs. W. L. Lewis & Co. and Sander. The former had Cattleya bicolor, C. Gaskelliana, Cypripedium Roezli, Cyp. Bradshawianum, Brassavola fragrans, and others tastefully displayed amongst Ferns and Grasses (a silver Banksian medal was awarded). Messrs. Sander & Co. received a similar honour. They had Habenaria carnea (first-class certificate, see below), Aërides Ballantineanum aureum (award of merit), Cypripedium Sander-superbiens (award of merit), the beautiful Pescatorea Klabochorum, and other choice things. T. Statter, Esq., Stand Hall, Manchester, sent Cypripedium Edwardi (award of merit), and several forms of Cattleya granulosa. Mr. Cookson had Cypripedium Sandersuperbiens (see page 195).

Competitive Classes.—Groups of plants and specimens were not so well represented as might have been expected. For a group of Palms and foliage plants to occupy a space not exceeding 800 square feet, the first prize of £15 being presented by Messrs. E. D. Shuttleworth & Co., there was only one exhibitor-namely, Mr. H. B. May, Dyson Lane Nurseries, Upper Edmonton. This contribution was tastefully arranged, the Palms being of graceful habit, and not too thickly disposed. Crotons, Dracænas, Ferns of various kinds, and Ananassa sativa variegata were conspicuous, and made a pleasing effect. In the class for a group of flowering and foliage plants arranged for effect, to occupy a space not exceeding 300 square ieet, Mr. J. Hudson, gardener to Messrs. De Rothschild, Gunnersbury Park, Acton, won. The group arranged by this exhibitor was very fine. The groundwork was composed of Adiantums and other Ferns, from which rose Liliums, Crotons, Ixoras, Pancratiums, Bouvardias, Vallotas, and graceful Palms. There was only one firm exhibiting a group of Liliums in pots, this being Messrs. Bunting & Sons, Colchester, to whom the first prize has been awarded. The plants in this group were grandly flowered, and made an imposing display. At the back were some fine L. auratum platy-phyllum, then plants of the L. lancifolium type, the front consisting of L. Batemanniæ and L. longiflorum. Mr. J. Nicholson, gardener to J. W. Meller, Esq., Sewardstone Lodge, Chingford, was the only exhibitor in the class for a group of flowering and foliage plants to occupy a of flowering and foliage plants arranged for effect, to occupy a space bitor in the class for a group of flowering and foliage plants to occupy a space not exceeding 150 square feet. This was a creditable arrangement, and the first prize was awarded. Palms and Crotons, the latter highly coloured, were the features here.

Specimen plants were not numerous. For eight Crotons Messrs. B. S. Williams & Son were the only exhibitors, and the second prize was awarded. The plants were only medium sized but richly coloured, especially Disraeli, Queen Victoria, Williamsi and Mutabilis. For twelve Coleuses, distinct, Mr. J. Nicholson was the only exhibitor. plants were good specimens and deserved the first prize awarded. competitors were forthcoming in the class for twelve stove and green-house Ferns,—namely, Mr. Howe, gardener to Henry Tate, Esq., Streatham Common, and Mr. P. McArthur, Maida Vale. named exhibitor proved victorious with fine specimens. were Goniophlebium subauriculatum, Nephrolepis ensifolia, N. exaltata, Adiantum Williamsi, Microlepia hirta cristata, and Dicksonia antarctica. The plants shown by Mr. McArthur were good specimens. Mr. Hudson was the only exhibitor in the class for a group of Pelargoniums of any class, showing well trained specimens of the scented leaved varieties, for which the first prize was awarded. Some of these specimens are very fine, the best being Radula, Pheasant's Foot, and Quercifolium minor. No less than twenty varieties were shown by Mr. Hudson. Mr. Howe was placed first for two large Palms, showing Kentia Fosteriana and Seaforthia elegans of gigantic size. Messrs. B. S. Williams & Son followed, and this firm also secured the prizes for two large Cycads, and two Palms in pots not exceeding 10 inches, and gained the only prize awarded for two large Tree Ferns. In many of the classes there were no entries, as for instance, those provided for a group of Tuberous Begonias, early Chrysanthemums, groups of China Asters, Zonal and Ivy-leaved Pelargoniums, Cannas and Fuchsias.

Messrs. J. Cheal & Son, Lowfield Nurseries, Crawley, gained the

first prize for a collection of Dahlias arranged for effect, with one of the most striking exhibits in the Show. The Dahlias were arranged in sprays of six blooms, and had between them sprays of Asparagus plumosus, the combination being a most happy one. Amongst the most beautiful of the Cactus section were Delicata (very fine), Duchess of York (good), Marchioness of Bute, Lady Primrose (very delicate), Edith Cheal (good dark), Blushing Bride (fine), Honoria (good yellow), and Countess of Radnor. Singles—Duchess of Fife, Miss H. Cameron, Alba Perfecta, Mrs. Parrott, Miss Glascock, Duchess of Albany, Lady Montefiore. Pompons—George Brinckman, Whisper (good), Isabel, E. F. Junker, Darkness, Revenge, Tommy Keith, and Martial. Show—Mrs. Gladstone, Mrs. Saunders, T. J. Saltmarsh, R. T. Rawlings, Prince Mrs. Poter MacPengia, Crimgon, King, Goldfinder, and of Denmark, Mrs. Peter MacKenzie, Crimson King, Goldfinder, and Theobold. The second prize was gained by Messrs. Keynes, Williams and Co., The Nurseries, Salisbury, with a very fine stand, in which Apollo, Bertha Mawley, Kaiserine, Countess of Radnor, Lady Penzance, Countess of Gosford, Cactus Gloriosa, seedling (award of merit, see below) and Daphne were the most prominent.

For sixty Show and Fancy Dahlias, in not less than thirty kinds, Mr. John Walker, Thame, Oxon, was first. The stand was composed of Majestic, Prince Bismarck, John Hickling, Crimson King, Colonist, Maud Fellowes, Harry Keith, Shirley Hibberd, Mrs. David Saunders, J. T. West, Wm. Rawlings, Henry Walton, Burgundy, Professor Fawcett, Majestic, Arthur Ocock, T. J. Saltmarsh, John Walker, Earl of Ravenworth, Dorothy, Mathew Campbell, Jas. Cocket, Willie Garratt, Prince Henry, Wm. Keith, John Neville Keynes, John Standish, Dr. Moffat, Mrs. Harris, Jas. Stephens, Harrison Weir, Wm. Powell, Prince of Denmark, Mrs. Jefford, Mrs. Gladstone, Fred. Smith, John Henshaw, and Constancy. The second prize was taken by Mr. S. Mortimer, Swiss Nursery, Farnham, with some magnificent flowers. Mr. Chas. Turner, Royal Nurseries, Slough, was a very good third. Messrs. Keynes, Williams & Co. have been placed first for eighteen bunches of Dahlias, staging in grand condition Apollo, Kaiserine, Baron Schröder, St. Catherine, Black Prince, Lady Penzance (award of merit, see below), Duke of Clarence, Lady Skelmersdale, Countess of Pembroke, Dawn, Delicata, Countess of Radnor, Bertha Mawley, Countess of Gosford, Chancellor (award of merit, see below), Miss Violet Morgan, Sir Roger, and Lady Henry Grosvenor. Messrs. J. Cheal & Son have taken the second prize. Their stand includes Delicata, Countess of Gosford, Ernest Cheal (award of merit, see below), Robert Cannell (very good), Beauty of Eynsford, and Countess of Radnor.

Messrs. Keynes, Williams & Co. took the premier award for eighteen bunches of Pompon Dahlias, distinct, ten blooms in each bunch. Crimson-Beauty, Lady Blanche, Little Jack, Midnight, Whisper, Janet, Sovereign, Admiration, White Aster, Isabel, Ceres, Darkness, Lælia, Grace, George Brinckman, Bacchus, and Madge are the varieties represented in this stand. Messrs. J. Cheal & Son were a very close second, with Mr. Chas. Turner a good third. In this stand Mr. Turner showed Rowena, for which he received an award of merit (see below). For eighteen bunches of single Dahlias Messrs. J. Cheal & Son deservedly secured the leading position with some grand blooms of Annie Hughes, The Bride, James Scobie, Evelyn, Lowfield Beauty, Yellow Satin, Miss Glascock, Ruth, Aurora, Amos Perry, W. C. Harvey, Duke of York, Gulielma, Lady Whitehead, Kitty, Formosa, Victoria, and Northern Star. The second position was occupied by Mr. E. F. Such, Maidenhead.

In the amateurs' class for twenty-four Show and Fancy Dahlias, W. Keith, Esq., Cornwalls, Brentwood (gardener, Mr. J. T. West) was first. The varieties represented in this exhibit were Harry Keith, Alice Emily, J. T. West, W. Rawlings, Dorothy, E. Britton, Edward Sherman, George Rawlings, John Walker, Nellie Garrett, Maud Fellowes, Arthur Rawlings, Sunbeam, R. T. Rawlings, Burgundy, Prince of Denmark, Frank Pearce, Mrs. Gladstone, and some seedlings. Mr. Vagg, gardener to Jas. Theobald, Esq., The Bedfords, Havering, Romford, secured the second place, and Mr. J. Gurney Fowler, Woodford, Essex, third. For twelve bunches of Cactus Dahlias to be competed for by amateurs, Mr. J. T. West staged St. Catherine, Jos. Chamberlain, Marchioness of Bath, Mary Hillier, Harry Freeman, Duke of Clarence, Blanche Keith, Mrs. Keith, Glory of Brentwood, Kynerith, Charles Bolfa, Boht, Mahor, and gained the first price. Mr. J. Carrier, E. Rolfe, Robt. Maher, and gained the first prize; Mr. J. Gurney Fowler being second and Mr. J. Hudson, Gunnersbury House Gardens, Acton, third. Mr. Maher, gardener to A. Waterhouse, Esq., Yattendon Court, Newbury, received the second prize for twelve bunches of Cactus Dahlias with good examples of Marchioness of Bute, Robert Maher, Lady Marsham, Honoria, Panthea, Juarezi, Professor Baldwin, and Mrs. Hawkins. This was the only exhibit in this class, and the first prize was withheld. For twelve bunches of Pompons, Mr. J. T. West was placed first with Eva. Fair Helen, Arthur West, Eurydice, Mary was placed first with Eva, Fair Helen, Arthur West, Eurydice, Mary Kirk, Achilles, Little Sweetheart, Tommy Keith, Gipsy and Winifred, and two seedlings in magnificent condition. Mr. J. Hudson gained the

Mr. B. Ladhams, Shirley Nurseries, Southampton, gained the first prize for a collection of herbaceous flowers, amongst which the best were Scabiosa caucasica, Gaillardias, Centaureas, Campanulas, Eryngiums, Perennial Phloxes, Anemone japonica, Tropæolum speciosum, Malva moschata alba, and Liatris Pycnostachya. Messrs. Paul & Son, the Old Nurseries, Cheshunt, were second; and Messrs. James Cocker & Son, nurserymon, Abordson third. Mr. C. H. Sarsa graduour to the Fact of nurserymen, Aberdeen, third. Mr. G. H. Sage, gardener to the Earl of Dysart, Ham House, Richmond, was first in the amateurs' class for a collection of herbaceous flowers, amongst which were Gaillardias, Statice speciosa, Irises, perennial Phloxes, Calliopsises, and Pyrethrums. The Rev. F. Page Roberts, Scole Rectory, Norfolk, was second; and Miss R.

second award.

Debenham, St. Peter's, St. Albans, third. Mr. Hudson was placed first for twelve bunches of herbaceous flowers, and had amongst others Rudbeckia laciniata, R. Newmanni, Helenium pumilum,

japonica alba, and Aster Shorti.

Messrs. Geo. Paul & Son secured the premier position for a collection of twelve bunches of Phloxes in not less than nine varieties. Their stand contained Eugène Dangaverillas, Roxelane, Caron de Aehe, Wm. Muir, Molière, Amazon, Baccile, John Forbes, Granville, Flambeau, Boule de Feu, and Comtesse de Castries. The second place was held by Messrs. Harkness & Son, nurserymen, Bedale, Yorks. J. Burrell & Sons, Cambridge, gained the premier position for a most beautiful collection of Gladioli, staging many fine varieties, amongst which Cassandra, Bernice, Gertrude, and Orlanda received awards of merit (see below). Messrs. Harkness & Son, Bedale, were second. Messrs. G. Paul & Son were awarded the first prize for a collection of Roses in pots and cut blooms. The flowers on the opening day were fresh and varied, the best being Marie Van Houtte, La France, Alfred Colomb, Beauty of Waltham, L'Ideal, and Ulrich Brunner. Messrs. J. Cocker and Sons, Aberdeen, followed with a collection of bright flowers, Mr. E. Mount, Canterbury, being third. Four competitors in this class. Mr. Gibson, gardener to T. F. Burnaby Atkins, Esq., Halstead Place, Sevenoaks, Kent, was placed first for twelve bunches of stove and greenhouse flowers, amongst which Allamandas, Anthuriums, Eucharis, and Dipladenias were conspicuous. Mr. Howe, Park Hill, Streatham, was a good second, the flowers in this stand being well arranged. The third prize went to Miss R. Debenham, St. Peter's, St. Albans. For a collection of Sunflowers and Rudbeckias Messrs. J. Burrell & Co., Howe House Nurseries, Cambridge, were first; Mr. G. H. Sage, gardener to Earl Dysart, Ham House, Richmond, was second, and Messrs. G. Paul and Son third. A. J. Rowberry, Esq., The Crescent, South Woodford, secured the silver medal presented by the London Pansy Society for twelve sprays of Violas, and Messrs. J. Cocker & Sons, Aberdeen, the bronze medal. bronze medal.

CERTIFICATES AND AWARDS OF MERIT.

Aërides Ballantineanum aureum (F. Sander & Co.).—An East Indian Aërides, noteworthy for the very rich colouring of the side lobes, which are very much deeper than those of A. Ballantineanum, being rich

butter-yellow (award of merit).

Agave Leopold II. (W. B. Kellock, Esq.).—This is a magnificent plant with an interesting history. It is the result of a cross between A. Schidigera princeps and A. filifera, the latter being the pollen parent. It was raised from seed sown about fifteen years ago, one of the parents being much admired by Her Majesty in visiting the gardens of the Royal Horticultural Society at South Kensington at that period, when it was exhibited by Dr. Kellock. The plant is one of the most effective Agaves we have seen, the spines being from 18 inches to 2 feet in length, covered with white woolly filaments. It was named in honour of the King of the Belgians by permission (first-class certificate).

Agave univittata marginata (W. B. Kellock, Esq.).—This is another seedling raised by Dr. Kellock. It is the result of a cross between

A. Schidigera princeps and A. univittata. The leaves are deep green with a distinct paler stripe down the middle, and the margins are white and smooth, wherein it differs from A. univittata (first-class certificate).

Carnation Mrs. Leopold de Rothschild (Reynolds).—A flesh pink variety, much after the style of Miss Joliffe, but with somewhat larger

flowers (award of merit).

Cornus brachypoda variegata (J. Veitch & Sons).—An attractive shrub with ornamental foliage. The centre of each leaf is pale green, with a well-defined cream margin (first-class certificate).

Cypripedium Edwardi (T. Statter, Esq.).—This hybrid is the result of a cross between C. Veitchi and C. Fairrieanum. It is a small but attractively marked flower, with drooping wavy petals, green lined with purple dots, and margined with purplish rose; dorsal sepal greenish white veined with chocolate and purplish rose (award of merit).

Cypripedium Sander-superbiens (Cookson).—A beautiful hybrid, procured by crossing C. Sanderianum and C. superbiens, and is the first Sanderianum hybrid yet produced. It was crossed by Captain Vipan and raised from his seed by Mr. Cookson. The flowers are very large, and are remarkable for the very long and drooping petals, which are double the length of the lip. They are pale yellow in colour, heavily blotched with chocolate, the lip brownish red, the pointed dorsal sonal greenish white with absolute lines (arread of marit) sepal greenish white with chocolate lines (award of merit).

Clerodendron trichotomum (J. Veitch & Sons).—This is a comparatively well-known hardy shrub from Japan. The foliage is large, of a deep green colour, the flowers being white with a purplish calyx

(first-class certificate).

Dahlia Ernest Cheal (Cheal & Son) .- A good Cactus variety with broad petals of a rich crimson scarlet colour (award of merit).

Dahlia Rowena (C. Turner).—A compact Pompon-flowered variety, the petals of which are clear yellow tipped and slightly flushed bright red (award of merit).

Dahlia Mrs. Mortimer (S. Mortimer) .- A good Fancy variety, clear

yellow tipped rosy lilac, fine form, quite distinct (award of merit).

Dahlia Gloriosa (Keynes, Williams & Co.).—Rich bright scarlet; fine flowers of the Cactus type (an award of merit).

Dahlia Lady Penzance (Keynes, Williams & Co.).—A Cactus variety with delicate primage and large scarled and several delicate primage and large scales and several delicate primage scales are several delicated and several delicate primage scales and several delicated an

with delicate primrose yellow coloured flowers; broad petals (award of

merit). Dahlia Lady Penzance (Keynes, Williams & Co.).—A fine, narrow-petalled variety of a clear canary yellow colour (award of merit).

Exacum macranthrum (Sir Trevor Lawrence),—This is a beautiful

plant, suitable for stove decoration, but it is by no means new. It was figured in the Journal of Horticulture for December 22nd, 1892. The flowers are of a bright purplish blue shade (first-class certificate).

Gladiolus Bernice (J. Burrell & Co.).—A fine spike with large

flowers of dull creamy shade, tinted pink (award of merit).

Gladiolus Cassandra (J. Burrell & Son).—This is a very fine flower, dull white or heavily shaded yellow and pink (award of merit)

Gladiolus Gertrude (J. Burrell & Co.).—A grand variety with delicate flowers, creamy white, tinted pale pink (award of merit).

Gladiolus Orlande (J. Burrell & Co.).—A fine variety with large deep

salmon pink flowers (award of merit).

Habenaria carnea (F. Sander & Co.).—A distinct species, much larger than H. militaris, and of a tender rosy flesh or blush colour. It is a most beautiful Orchid, and was much admired (first-class certificate).

Helianthus rigidus Miss Mellish (Rev. W. Wilks).—This is a grand form of the well-known type. The flowers are rather large, and of a bright golden yellow (award of merit).

Lilium Henryi (Wallace & Co.).—This beautiful Lilium is illustrated

and fully described on page 191, so it is needless to reiterate here (first-

class certificate).

Rose Duke of York (W. Paul & Son).—This is a new China Rose of great merit. The flowers are neat in shape, medium sized, and of a rich silvery pink shade (award of merit).

Pentstemon Clevelandi (Sir Trevor Lawrence).—A charming hardy

plant with spikes of scarlet flowers (award of merit).

Pink Ernest Ladhams (B. Ladhams). — Very fine border Pink. Flowers pale blush, heavily fringed, blotched rich maroon at lower part of petals (award of merit).

Weigela Eva Rathke (Anthony Waterer).—This is described as being "a perpetual bloomer." The flowers are dark red, and certainly form a novelty at this period of the year (first-class certificate).

HORTICULTURAL BUILDINGS AND APPLIANCES.

These were fairly well shown, most of the leading firms being represented, but the magnitude of the floral and fruit exhibits somewhat dwarfed this portion of the Exhibition. The greenhouses, heating appliances, and stands of horticultural sundries, being arranged at one end and along the sides of the vast hall, were perhaps not seen to the advantage they would be were it possible to have had them in more conspicuous positions. Noticeable amongst the glass structures were the substantially built houses of Messrs. Foster & Pearson (Limited), Beeston, Notts, who were well represented. Here may be seen buildings fitted with every modern improvement, also heating appliances of the best type, and fitted with patent smoke consumers. Frames of various kinds, including the popular three-quarter span-roof type, were also shown by this firm (silvergilt Flora medal). Mr. W. Cooper, the horticultural provider of the Old Kent Road, S.E., made a splendid show of his specialties. About a dozen greenhouses of various kinds, suitable for large or small gardens, were exhibited, these being fitted with heating apparatus. Poultry houses were also shown by Mr. Cooper, who had likewise a stand of composts, fertilisers, insecticides, and general sundries for the garden. We were unable to find the mention of any award either on the official list supplied to us or on the exhibits for this large and useful contri-

bution; was it an oversight?
Mr. G. W. Riley, Herne Hill Rustic Works, Dulwich Road, S.E., contributed a number of rustic summer houses of a varied type and strong appearance (silver Banksian medal). Messrs. E. Newton and Co., Hitchen, Herts, have a well-built greenhouse, and Messrs. Messenger & Co. were well to the fore in that respect. This well-known firm exhibited a large span-roofed greenhouse fitted with hot water pipes and a propagating bed, which could not be other than useful in any garden (silver-gilt Flora medal). Mr. C. Toope, Stepney Square, Stepney Green, E., had a miniature greenhouse fitted with Toope's patent fog purifying and self-ventilating system. Small boilers, and oil and gas stoves, suitable for heating small greenhouses, were also exhibited by Mr. Toope (silver Banksian medal). Messrs. Fenlon & Son, Eldon Street, E.C., had various heating appliances for large and small structures, and the automatic damper was shown (silver Banksian medal). Messrs. Sam Deards & Co. also sent apparatus for heating purposes, and a small greenhouse "glazed without putty, springs, lead, or packing of any kind" (silver Banksian medal).

Manures, insecticides, and other sundries made quite a display. Messrs. H. & E. Albert, 17, Gracechurch Street, London, E.C., had a

stand of their pure concentrated manure which has proved so beneficial as a fertiliser. Mr. W. Colchester, Ipswich, showed tins of Ichthemic guano, and Messrs. Corry & Co. had a stand of garden necessaries, including thermometer, stakes, baskets, labels, and other items. The Stott Co., Limited, Manchester, made a good show with their useful sprays, syringes, engines, and the equally serviceable "Killmright" insecticide. A large stand of manures, soils of various kinds, stakes, labels, and other essentials for garden use was arranged by Messrs. Wood & Sons, Wood Green, N. Mr. J. T. Anderson, 135, Commercial Street, Shoreditch, also had a number of speciality well displayed, one of the most important of which was a new kind of "wood wool." This material is very fine and much softer than the ordinary "wood wool," and might, therefore, be used for packing tender fruit and choice flowers. Mr. J. George, 10, Victoria Street, Putney, was represented by a stand of Thomson's Vine and plant manure and other garden sundries. A large collection of grasses, insecticides and fumigating material came from Messrs. Sly, Dibble and Co., 2, Colonial Avenue, London, S.E., and the Lawes Chemical Co., 5, Mark Lane, E., had a stand of disinfecting fluids. Messrs.

Osman & Co., had an attractive display of material useful for decorative purposes, and Clarke's patent syphon oil stoves are shown (silver Banksian medal). Other miscellaneous exhibits are plentiful, and included a stand of fruit and vegetables and seeds from Messrs. Harrison and Sons, Leicester. Messrs. Gayner, Banham, near Attleborough exhibited Apples as used for cider making, the stand forming quite a feature in the exhibition. The Standard Manufacturing Co., St. Alkemund's Churchyard, Derby, had a large number of their tree and shrub pruners, which, judging from a practical demonstration, are of great service. The same firm exhibit "the standard fruit gatherer," a useful contrivance for reaching fruit on outside branches of high trees. Combined with this implement is a pruner, the net for catching the fruit being moveable (silver Flora medal).

We were not able to obtain an official list of the prizes and awards

made other than in the implement division, and this was apparently incomplete; therefore if any omissions occur further reference must

be made to them.

EVENTS OF THE WEEK. - The principal events of horticultural interest during the ensuing week include the annual Exhibition of fruit, flowers, and vegetables, which is held at Sandy, Bedfordshire, to-day (Thursday). On Friday, September 1st, the Show of the National Dahlia Society will open at the Crystal Palace, continuing the following day. A three-days Exhibition of Dahlias and Gladioli will open at the Royal Aquarium, Westminster, on Wednesday, September 6th. The Agricultural Hall Show, which is reported in the present issue, continues open until Friday night.

- THE WEATHER IN LONDON.—For the most part fine dry weather characterised the past week in the metropolis, although it has been decidedly cooler, especially at night. At the time of going to press, however, it is dull but with prospects of clearing.

- ROYAL GARDENERS' ORPHAN FUND.—A handbill has been sent to us announcing that the Director of the Promenade Concerts, Theatre Royal, Covent Garden, has made arrangements to supply tickets on liberal terms in aid of the above fund, but we have not received any official information relating to the project.

- MR. JAMES DOUGLAS.—The first Carnation and Auricula catalogue of the well known gardener and florist of Great Gearies reminds us that we have not made any announcement of his having established a business at Great Bookham. He purchased land there some time ago, and we have seen in passing a fine glass structure. His catalogue of new and choice varieties of Carnations and Picotees and Auriculas indicates that he has large stocks of plants for distribution. The business address of Mr. James Douglas is Edenside, Great Bookham, Surrey.

- FATAL ACCIDENT TO MR. W. D. LLEWELYN .- The profound sympathy of a wide circle of horticultural friends will be extended to Sir J. T. D. Llewelyn, Bart., in the terrible loss that he has sustained in the death of his eldest son, Mr. William D. Llewelyn, who was found dead in Penllergare woods on Friday last. He had gone out with his gun and fishing rod, and not having returned at a late hour a search was instituted, when the shocking discovery was made that he had been killed by the discharge of his weapon. Mr. William Llewelyn was in his twenty-sixth year, and when at Oxford was a noted cricketer. At the time of his death he was a Justice of the Peace for the county of Glamorgan, and the melancholy circumstances of his untimely fate are heightened by the fact that he was shortly to have been married, and only a day or two previously had attended the wedding of his younger brother. An inquest was held on Saturday, when a verdict of accidental death was returned and a vote of condolence with his relatives was passed. The tragic event has cast a gloom over the whole neighbourhood, for there, as in the horticultural world, Sir John Llewelyn is extremely popular.

- "PERFECT" WEED KILLER.—We have received from Mark Smith, Ltd., Louth, samples of the "Perfect" Weed Killer, and after a thorough test can vouch for its efficacy. This preparation is in the form of a powder, and one of its greatest advantages is its portability as compared with the liquids which have previously been prepared for the same purpose.

- —— GARDENING APPOINTMENT.—Mr. J. Hollingworth, Woodseat, Uttoxeter, has been appointed gardener to Lord Tredegar, Tredegar Park, Newport.
- —— HANDSOME LEGACY.—According to a daily paper, the late Lord Calthorpe has left by his will £700 to Mr. Thos. Jones, the head gardener at Elvetham Park, Winchfield.
- THE BAMBOO COMPANY, late of 58, St. Paul's Churchyard, desire us to mention that they have removed to more commodious premises at Great Sutton Street, Clerkenwell, E.C.
- THE WAKEFIELD PAXTON SOCIETY.—At the meeting of this Society last week Mr. T. Pitts, gardener to Dr. Kendell of Walton, gave an interesting and instructive discourse on "The Pea," illustrated by a number of specimens of the most popular kinds, fully describing the best methods of culture. Several members took part in a discussion of the subject.
- —— THE members of the HIGHBURY HORTICULTURAL SOCIETY made their outing to Swanley on Saturday last. After inspecting the neighbourhood they made long inspection of Messrs. Cannell & Sons greenhouses and seed farms. A large Wardian case containing seedling Chrysanthemums that were shown at Sydney (New South Wales) last April, causing much sensation there, had just arrived, and this, together with Begonias, Brugmansia Cornucopia (The Horn of Plenty) much interested the visitors.
- DERBYSHIRE HORTICULTURAL SOCIETY.—We have received a schedule and tickets for the Show, which is to be held on September 6th and 7th, but there is no intimation where the Exhibition will be held, but presumably in or near Derby. We note that some good prizes are offered, including £20, £15, £10, and £5 for groups of plants, and these should insure first-class competition. The Exhibition is to be held in connection with the Agricultural Show, Mr. W. Bacon, Beckett Mill Printing Works, Derby, being the manager of the horticultural department.
- TURAL SOCIETY, held at Stranraer, the leading prizes for Roses were won by Messrs. Thomas Smith & Sons and Mr. McMicking, head gardener to James McDouall, Esq., of Logan, in the parish of Kirkmaiden. A splendid specimen of Charles Lefebvre exhibited in the Logan collection was considered absolutely perfect. Mr. McMicking was equally successful with his Dahlias, which were remarkably fine. The richly coloured Grapes exhibited by Mr. Day, Lord Galloway's head gardener, easily obtained the premier place; while the Rev. Dr. Barty of Kirkcolm was first as formerly with herbaceous flowers.
- LILIUMS AT CHELSEA.—In the large show house at Mr. Wm. Bull's Nursery, King's Road, Chelsea, there are at present in flower some very beautiful Liliums. Amongst the best were a large flowered pure white variety of the speciosum type named album novum; L. s. punctatum, another small pure white flowered variety with coloured spots on the petals; L. s. Melpomene, a very dark coloured variety having fine flowers and an unusually broad leaf; L. Henryi, the colour of which is I suppose a rich apricot, the petals being sparsely speckled with brownish crimson. This is a most attractive species with extremely fragile looking growths. L. Batemannæ was also seen standing out prominently amongst numerous others.—W.
- FARM ORCHARDS.-Mr. J. Hiam writes:-"I have read the articles on this subject with much interest which have lately appeared in the Journal, and can speak as to the deplorable condition in which many orchards are, but with the best material to renovate them running to waste down the ditches and into the streams, the liquid from farmyards. In my lectures last spring I made this a leading subject among country audiences, including many farmers, and placed on the slides under the microscopes spots of sewage after evaporation, in order to bring most intelligently to their minds and eyes the great waste of manure running away at their expense. In support of what I recommended I turned a stream of water in February from an ordinary field ditch to irrigate a row of Apple trees. The effect has been that, in spite of the excessive dry spring and summer, the trees have made more growth than during the past ten years, and the fruit is quite double the size I have ever grown of the same sorts, whereas the rule of the season is that fruit is very small. Irrigation on well drained ground works wonders, and the surprise is that so few appear to realise the advantages of brooks and streams with the aid of self-acting rams and other means."

- —— FRUIT TREES IN SWITZERLAND.—In Switzerland it is stated that very stringent laws exist for the protection of fruit trees from insects and other pests. No tree owner is allowed to treat his trees as he chooses, but a strict watch is kept over both amateur and professional horticulturists.
- —— FRUIT HAWKERS IN OLDEN TIMES.—According to a daily contemporary, in the sixteenth century there was a curious enactment in England whereby street hawkers were forbidden to sell Plums and Apples, for the reason that servants and apprentices were unable to resist the sight of them, and were consequently tempted to steal their employer's money in order to enjoy the costly delicacies.
- SUDDEN DEATH OF A JERSEY NURSERYMAN. We regret to hear of the death of Mr. Ch. B. Saunders of Jersey, who died suddenly from apoplexy on August 1st. Mr. Saunders was born January 4th, 1824, and at the early age of twenty-one took over the management of his father's then very extensive business of a nurseryman and fruit grower. It is reported that his business will be continued by Mr. Becker.
- A French Pomological Congress.—We understand that the tenth general Show and the eleventh Pomological Congress, organised by the Pomological Association of the West of France, will take place at Vannes from October 17th to 22nd. The samples of fruit destined for the Show are to be the property of the Society, and must be sound, ripe (or almost ripe), and represent the average type of exhibited varieties. A special exhibition of instruments, such as crushers, grinders, presses, and stills will also be held.
- ROYAL HORTICULTURAL SOCIETY'S JOURNAL. We have received a copy of part 1, vol. xvi., of the Journal of the Royal Horticultural Society. This forms a neat book of upwards of 300 pages, and contains much useful information. The papers that have been read at the meetings held during the first half of the present year are included, and these alone are worthy of perusal. Extracts from the proceedings of the Society are also given, and the whole of the awards made during the above-mentioned period are enumerated. Many of the new and rare plants are illustrated. The price of the work to non-Fellows is 5s.
- THE POTATO CROP IN JERSEY.—This is the second year in succession the Jersey Potato crop has been unsatisfactory, the price made per ton for those exported having been a little less than £5, against an averaged value for eleven years of rather over £6. The crop is about 11,000 tons less than in 1892. It is stated that the earliest consignments only made £20 per ton this year against £52 last year, while the latter ones made £3 10s. per ton against £2 3s. 4d. last year. The total amount received for the crop this year is no less than £160,275 8s. 4d. less than for the good crop of 1891, in which year no Potatoes were sold at less than £5 per ton.
- SPARROWS AGAIN.—The sparrows have undoubtedly many sins to answer for from a gardener's and farmer's point of view, but I can speak from many years' close observations that they are particularly fond of the Oak leaf-rolling caterpillars, the chrysalids, and the moths. Neither are they the only helpers the rooks have in clearing Oaks, for starlings, the tit tribe, and in the mature state swallows and martins, darting hither and thither among the branches, take the moths, and help in the general destruction. Sparrows undoubtedly take much insect food when they have young. I once put a brood in a cage, and the old birds brought a large number of cockchafers and pushed them between the wires, but the young birds dropped them in the bottom of the cage, not being able to feed themselves.—J. HIAM.
- WHITE ANTIRRHINUMS. Why does "T. S." (page 172) refer to the variety in bloom with him as "Iggulden's?" It would be as correct for me to refer to the white Snapdragon which blooms so beautifully at Swanmore Park as "Molyneux's." The fact is the variety is found in all directions, and though I have never seen it anywhere in such profusion or more beautiful than at Swanmore, yet it is to be found in many gardens. It is very much more to the point to find that such striking effects can be obtained from Antirrhinums. There are plenty of other self-coloured forms that would answer equally well if grown from cuttings, as this white variety is. I had a splendid rich crimson with a white throat at Bedfont, named Brilliant, that I have not seen excelled for effectiveness and would make a beautiful bedder; for this purpose striking self colours are best.—A. D.

DEATH OF MR. THOMAS DOBSON.—It is with regret that I have to announce the death of Mr. Thomas Dobson, which took place on 22nd inst. He was for over thirty years head gardener to Sir Hedworth Williamson, Bait., at Whitburn, near Sunderland, and was deservedly and highly respected amongst his brother gardeners. He had lately been pensioned off by Sir Hedworth, and but recently, during the inspection of a neighbouring gentleman's greenhouse, he fell and injured his head, from which effects he never recovered, and there is no doubt the sad occurrence hastened his death. He was interred Thursday last at Harton. Amongst the mourners were Sir Hedworth Williamson and the principal servants of his estate.—BERNARD COWAN, F.R.H.S.

— FIELD Voles.—I have been much interested from time to time in watching the doings of the Board of Agriculture in respect to diminishing the plague of voles in Scotland, and quite agree with the remarks on page 138 as to the use of owls, kestrels, and weasels as useful destroyers of these pests, from what I have observed. Owls and kestrels ought to be not only encouraged instead of destroyed, but to have homes placed in convenient places to breed and roost in, and so accumulate. I have had both in my homes placed in the trees in the fields. Voles are fond of fruits and vegetables. I catch them with baited traps with Apple, but this would involve too much expense to carry out on a large scale probably. Still, when it comes to a matter of reducing the value of land to such an extent, the best and cheapest way to restore its value is the consideration.—J. HIAM.

Nemesia Strumosa Suttoni.—"R. P. R." writes:—"This annual, sent out by Messrs. Sutton & Sons, bids fair to become a popular plant. Although not one of the best of seasons in which to try a new introduction, this charming plant has stood the test well. There is a strange fascination about the flowers which is rather difficult to describe, some I have seen being of a rich orange, pale yellow, beautiful shades of ochre, the throat being quaintly blotched with black and yellow. If seed is sown about the middle of March in gentle heat, and the seedlings transplanted when the danger from spring frost is over, the plants will branch out freely. This last season being so dry the plants have reached a little more than a foot in height, and I should fancy 18 inches would be the limit. Dwarfer plants may be produced by pinching out the leading point of the plants when well established after transplanting."

FRUIT IN NORTHUMBERLAND.—A northern daily contemporary remarks that a very boisterous south-west wind made havoc amongst the fruit trees in the orchards and market gardens in the Hexham district last week. The mischief was worst amongst those trees which bear fruit of the largest size. Some Apple trees which bear only a limited number of fruit, but of a large and superior size, were almost stripped, while trees bearing a smaller class of fruit only lost, comparatively speaking, a small percentage of their yield. Pears, particularly of the Hessle variety, were an abundant crop. One tree, growing on the bank of the Hextol stream, had to have its branches propped up, so heavily were they laden. The wind stripped the Pear trees of a good percentage of their fruit. The Plum trees did not suffer anything like so severely, the trees being smaller, and not so much exposed to the violence of the wind.

- THE WEATHER AND THE CROPS. - Mr. P. Davison, The Gardens, Iwerne House, Blandford, observes:-The summer of 1893 will long be remembered in the annals of horticulture for its excessive drought and heat. The spring months, with few exceptions, were mild, and brought forth an early and abundant show of fruit blossom of all kinds. During its expansion and setting we had three frosty nights in succession, varying in intensity from 9° to 12°, which left its indelible marks on the embryo fruit, and is now apparent in blotches, blister, and deformed Apples and Pears. Still, we have abundant crops of the two latter, and also all kinds of fruit, including Strawberries and bush fruit. The latter were small, and wanting in juice and flavour. The drought was most severely felt in the months of April, May, and nearly all June. Lawns and pasture fields were brown and bare. It was only by dint of mulching and incessant waterings that we could keep our young plants alive in the kitchen garden and in the flower beds. Vegetables suffered severely - Peas nearly a failure, while Lettuce and Spinach ran to seed, and Turnips were dry and stringy and bitter in taste. Rain came moderately at the end of June, and in July a large quantity fell and gave vegetation a new life. We are now having a plentiful supply of vegetables, such as Autumn Giant Cauliflower, Vegetable Marrows, Beans, dwarf and running. Cabbages have been terribly infested by the caterpillars. The temperature during the present month has been exceedingly high. At noon, on the 16th and 17th inst., the thermometer indicated 95° in the open. Late Peas, such as British Queen, Egyptian Marrow, &c., are eaten up by mildew. Wasps, and all insect pests, have been unusually numerous and troublesome this year. Potatoes are a splendid crop of good medium size and excellent flavour, and so far are nearly free from disease.

A FUCHSIA SHOW.—A western contemporary remarks that at Bristol the grounds presented an exceptionally attractive appearance at the Zoological Society, Bristol, when the Fuchsia Show was held recently. The plants were attractively set out in a large marquee erected on the lawn, the effectiveness of the display being enhanced by the judicious use of Palms and Ferns. There were altogether 160 Fuchsia plants exhibited, and Mr. Harris, the Society's head gardener, may well be proud of the fine show they made. Possibly owing to the fierce heat experienced of late, the collection would have looked a little better a month ago, but the sight of the Fuchsias, over-fruitful in their rich clusters of pendulous bloom, was one not to be missed by admirers of flowers. Altogether 109 distinct varieties were represented. Seedlings looked extremely well, and formed an important feature of the Exhibition.

— Dahlias at Rowledge.—That Mr. Mortimer should, in the first London competition for Show Dahlias, have exhibited such beautiful blooms as he did at Earl's Court, winning the prize easily from older competitors, is all the more remarkable when it is remembered that the soil in which his Dahlias are growing was but a few years ago a piece of poor, starved shallow heath or common; so poor, indeed, that it would have seemed dear at 10s. per acre. Even now, close by, there is land that wears just the same starved hungry appearance, and which no one would for one moment think could hardly grow a Potato, much less a Dahlia. The result, as seen with the Dahlias, shows what can be done in converting a barren heath into living productive soil. Here it is as dissimilar from what is found at Slough, Salisbury, and Thame, as chalk is from cheese. It is therefore all the more to the credit of Mr. Mortimer that in such a dry season as the present has been he should have done so well.

CURIOUS JUDGMENTS.—If we did not know that Mr. Pettigrew did not pose as a wag, we might have imagined that he had been joking over the oddities of the judges at Cardiff, whose acts he criticises. How on earth was it possible for judges to read the term "exotic" as they did? If they will turn to their dictionaries they will find the term signifies "foreign"—that is to say, any plant introduced here from other countries is an exotic, or, in other words, is not indigenous to Great Britain. Mr. Pettigrew intimates that the term exotic, without any explanatory prefix, was employed. Then, of course, every imported plant was inadmissible. Why will committees make such errors in compiling their schedules, and judges do such odd things? The placing of Roses and Hydrangeas amongst hardy herbaceous perennials is indeed another oddity. How Mr. W. Marshall would have revelled in the consequent disqualification.—D.

- FLOWERS IN A CEMETERY .- South Shields possesses parks, the beauties of which are greatly admired; but it can also boast of another floral display of a most attractive kind. The latter, however, is not in a pleasure ground, but in a cemetery. In connection with their new place, near Harton, the South Shields and Westoe Burial Board have adopted a policy from the first of making it as cheerful and pleasant-looking as possible. Mr. Bernard Cowan, F.R.H.S., the Superintendent, during the present summer has been most successful in this respect, and the ground under his control will well repay a visit from all admirers of fair Flora. The cemetery, says the "Newcastle Daily Journal," has been laid out so as to hide the graves from public view as much as possible, and on first entering the place it is difficult to imagine that it possesses any sombre aspect at all. On the other hand it has all the characteristics of a fine ornamental garden. Some skilfully worked-out designs in carpet bedding attract attention at the entrance, while further on the borders of the main roads are simply charming. Some of these are arranged in circular and oblong flower beds cut out of the green turf, and present a most tasteful arrangement of colours. Others, fully occupied with herbaceous plants, are ablaze with bloom of great variety of colour and form, while yet another has a magnificent display of Carnations in full flower. The trees and shrubs which surround the grave spaces have grown rapidly, and their thick foliage sets off splendidly the floral display. Altogether, the cemetery presents a most charming appearance, and reflects high credit on its Superintendent.

HALTON.

HALF hidden amongst the trees with which the Chiltern Hills are covered lies the rural village of Halton, which claims as a resident one of the greatest financiers of the day—Mr. Alfred de Rothschild. His estate, which covers an enormous area, is, perhaps, one of the most beautiful in this country, the gardens being models from which anyone might easily learn a lesson. Cleanliness predominates over all, from the stately mansion of Bath stone down to the humble potting shed. An invitation to go and have a look "all over the place" was accepted with alacrity, but with a very faint idea what those few words

got to the top of one of the Chiltern Hills, from whence the panorama presented before our eyes was one of surpassing beauty. Down in the valleys lay the fertile vale of Aylesbury, with the stately home of the Earl of Rosebery showing amongst the trees, and away beyond on another high hill could be seen Waddesden Manor, the home of Baron Ferdinand de Rothschild. Truly we were in the country of the Rothschilds; on every side the land for miles belonged to some one of this wealthy family, who are so highly respected by their poorer neighbours, to whose comfort and well-being they are so truly solicitous. A little further on and we come upon a veritable plateau on the top of a hill, not a natural one be it understood, but one which Mr. de Rothschild

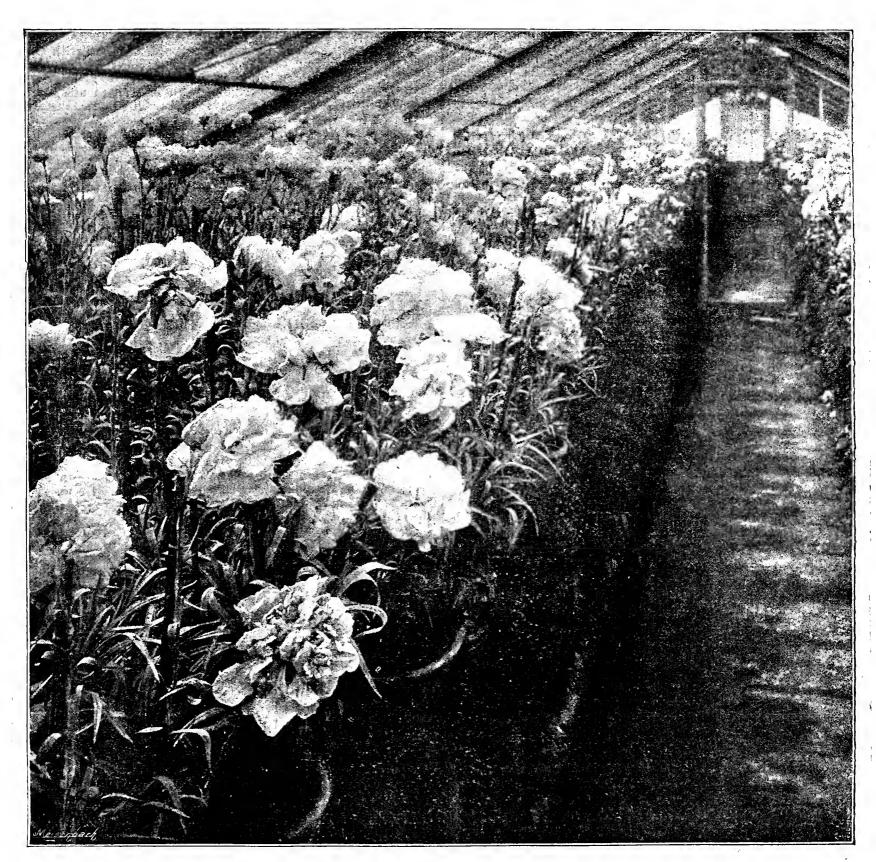

FIG. 29.—SOUVENIR DE LA MALMAISON CARNATIONS AT HALTON.

meant on a summer's day with the thermometer registering well into the nineties, and that in the shade. However, notwithstanding the heat, I spent one of the most enjoyable and instructive days I have ever had during my life. I will endeavour to recall for the benefit of those readers of the Jonrnal who are unable to visit Halton some of the points which appeared to me to be of more than passing interest or of unusual beauty.
